Pigeons do not like rice, but we have known it to be used successfully when fed in small quantities mixed with a variety of other grains. We refer now to the hulled rice such as is used for table purposes. Pigeons do not like broken rice grains nor any other broken grain feed; they are partial to whole grain. A large amount of rice would be very likely to injure the digestion for reason that it is too starchy. They will not eat paddy or unhulled rice unless nearly starved.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat around \$2 a bushel and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Fair Treatment

Bring Back Any GOODRICH BLACK SAFETY TREAD TIRES That Owe You —Anything—

FROM Maine to California, and on around the world, The B. F. Goodrich Company sends forth this all-including invitation:

Bring back any Goodrich tires you feel have failed to give you right service.

Goodrich will at once make good all their shortcomings—generously and gladly.

There are no strings to this offer—no conditions—no catch words.

THE GOODRICH SUPER-GUARANTEE

For a Goodrich Black Safety Tread Tire carries with it in the market an unwritten SUPER-GUARANTEE that it is the best fabric tire, the largest, oldest, and most resourceful rubber manufacturer can produce.

The very name of Goodrich pledges it to the best service a fabric tire can give—style, safety, comfort, durability, freedom from tire trouble, and mileage.

The buyer takes no risk of imperfection in it. A Goodrich tire must deliver the high standard of service Goodrich pledges for it, or Goodrich Fair Treatment squares the account in full.

"BEST IN THE LONG RUN"

Mrs. Best's Letter.

Spring Garments.

My Dear Friends: The separate coat gives promise of being just as good style this spring as it has been all winter. The new spring garments are in lighter colors, bright green and black and white checks being very good. They nearly all have large cuffs and collars and many times the collar is a contrasting color to the coat itself. One of a taupe color had a cardinal collar and stitching of cardinal around the deep cuffs and big pockets, while another of soft green had a white collar with stitching and big buttons of white. Both of these had plain waists with a skirt gathered on, and partly belted.

Tailored Suits.

The very newest thing in tailored suits, so I am told, is the plain skirt and unbelted coat. This is a real blow to many, for the belted models have been wonderfully popular and becoming to most figures.

The advance rumor that skirts are growing narrower and longer seems to be true—the tailored suit either has a narrower skirt or, if pleated, the pleats are pressed down to give the straight, slim line so much desired.

In the one-piece dresses, occasionally there is some fullness on the hips, produced by the cartridge pleats, which are still worn, but the straight, slim line rather leads in popularity and the prevailing materials, soft satin, georgette, chiffon and crepe de chine as well as the soft finish wools fall into clinging lines very gracefully.

New Cloths for Dresses.

Jersey cloth is having a great run of popularity for spring suits and the white Coolie Silk suits are very fetching. In addition one sees serge, gabardine, covert and homespun that will be very serviceable and suitable for all kinds of wear.

There are more voile waists as spring draws near and they seem to be developed in a more trimmed style than the crepe de chine. Many of them have lace insertion and lace-trimmed collars and others have plaited frills edged with lace or a scalloped edge.

The newest note in the dresses are the sleeves—there are many smart types of sleeve shown and it is almost the only change in the chemise dress of last season.

Hand embroidery is shown on the new afternoon gowns and the beaded effects are still good style.

Rosabella Best.

RURAL CHURCHES.

Churches seem to be awake to the fact that a country church should be a power in the community in other ways than merely for church service.

The Department of Rural Work in one of the denominational churches is commissioned to make surveys in rural church fields to ascertain their resources and needs, to apportion such funds as may be appropriated for this purpose, to promote the study of rural sociology among the ministers and to co-operate with the allies of the church in the task of improving the social, economic, educational and religious life of the rural sections.

THE HOME CIRCLE

IN FEBRUARY.

Oh, they say it's growing colder every day,
That the winter's growing bolder every day;
Since the woodchuck's gone to sleep in his cavern dark and deep,
There'll be six weeks more of snowing,
Of freezing and of blowing,
Every day.

But the day's a little longer every day,
And the sun's a little stronger every day;

If we're patient for a while,
We shall see the summer smile,
And the buds will soon be showing,
For they're growing, growing, growing,
Every day.

And the birds will soon be singing every day,
Northward now they'll soon be winging every day;

Though the frost is in the air,
There's a feeling everywhere
That the skies are growing clearer,
And the springtime's drawing nearer,
Every day.

—Annie Johnson Flint, in St. Nicholas.

HOW TO CURE HAMS.

After the hogs have been killed and the meat is thoroughly cooled, the fresh surface is sprinkled with fine saltpeter until the surface is white. About three or four pounds of saltpeter are used on 1,000 pounds of hams. Fine salt is then rubbed over the surface and the hams are packed in bulk not deeper than three feet and allowed to remain for at least three days. The bulk is then broken and the hams resalted and repacked. Each ham should remain in bulk at least a day for each pound of weight. The hams are then hung up and slowly smoked for thirty to forty days with hickory or red oak bark. When the smoking is finished, they should be peppered and hung in canvas bags to guard against vermin. Hams cured as directed improve with age and are considered perfect when about one year old.

A MINIATURE GARDEN.

To make a miniature Japanese garden at home, take a long baking pan and paint it white. Then fill with soft white sand and place two horseradish roots firmly enough in the sand that they will not roll. build a little island of rocks in the center, filling the crevices with sand, and sprinkle with canary seed. The horseradish will produce a lovely green foliage and the canary seed also, giving an appearance of a green island in the midst of a sandy lake. If desired more elaborate, add the figures and bridges that can be purchased at a Japanese store.

WHAT TO DO WITH THE HANDS.

Few women know what to do with their hands in idle moments. There can be no rules laid down from which to learn how to hold and use the hands gracefully, except that you must relax and forget them entirely.

To put grace into the movements of the hands, there must be no nervous, jerky, gestures nor fidgeting with purse or other articles. Avoid

spreading out the hands upon the knees or having the arms folded tightly at the waistline and above all, do not place the hands upon the hips.

When standing, if the arms are relaxed, the hands should take care of themselves, and when sitting, one hand resting palm upward inside the palm of the other is a graceful position.

ARTISTIC DRAPERIES.

One of the things necessary to consider in the discussion of draperies is the weaving together of color and fabric to make a balanced tone of color.

For example, a room with a two-toned paper and a mulberry rug should have an ecru curtain next the windows with over draperies of mulberry.

If the walls are a cool gray, crimson would be better than the mulberry, while if the walls and woodwork were white, hangings and rugs of blue would produce a charming effect.

Dead white curtains are apt to not be harmonious as the contrast is too sharp. Either ecru or cream are better. In houses where the over draperies are lined, roller shades can be dispensed with and the draperies can be drawn together to temper the light or give privacy. Cretonne curtains retain their color better if lined, and an unbleached muslin answers very well for that purpose.

ROAST HAMBURG STEAK.

To 1½ lbs. Hamburg steak add 2 slices fat salt pork, finely chopped, ½ cup bread crumbs, one egg, ¼ teaspoon salt. Shape in loaf, dredge with flour, and over top put 7 strips fat salt pork. Roast 45 minutes, basting often, first with ¼ cup water and then with fat in pan. To liquid in pan add water to make 1 cup. Brown 1½ tablespoons butter, add 2 tablespoons flour and the cup of liquid.

BAKED CAULIFLOWER.

One medium sized cauliflower, 2 cups white sauce, 1 cup grated cheese, 1-3 cup melted butter, 1 cup cracker crumbs, salt, pepper, paprika to taste. Boil the cauliflower in salted water until tender. When done, drain and place head upward in a buttered casserole. Mix the cheese with the white sauce and pour over the cauliflower. Stir the cupful of fine cracker crumbs into the melted butter and sprinkle over the top. Bake until browned.

SQUASH PUDDING.

Mix ½ cup sugar, 1¼ teaspoons salt and 1 teaspoon cinnamon and add 2¼ cups steamed and strained squash, the yolks of 2 eggs slightly beaten and 2¼ cups hot milk; then add whites of 2 eggs, beaten until stiff. Turn into a buttered pudding dish and bake in a moderate oven until firm. Cool before serving.

COMPARATIVE FOOD VALUES.

One and one-half quarts milk equals a 1 pound steak; 1 quart milk equals 7 pounds of cabbage, or 14 eggs, or 3½ lbs. of potatoes.

Floral Department.

[By Geo. N. Tyler.]

Chrysanthemum Growing.

If you are going to grow any single and pompon chrysanthemums this year, enrich a sunny piece of ground and get divisions from old plants. After these are established pinch them out so they will branch, and keep on pinching until July—do not do any pinching after that date. Get and plant them as soon as possible. Plant eighteen inches apart, for by planting early they make large bushy plants with from twenty to fifty blooming shoots. They require staking. One center stake is enough, but do not require any disbudding, and they keep in bloom for six weeks and give a grand lot of flowers for the house or decorative purposes—when flowers are scarce. They come in all colors, white, light pink, dark pink, violet, bronze, two or three shades of yellow, etc.

Plant Violets.

If you want any violets for next October, now is the time to start your beds. Give rich soil in a sunny location, and if the soil is not very rich use a liberal coating of cow manure, half rotted. Take four or five of the runners and trim off the leaves, leaving a stem five or six inches long, and plant the four or five runners, so that the crowns are just above the surface of the soil. They should be planted two feet apart both ways. The object of four or five runners is to insure a large crown, or plant for next winter's bloom. They do not require much water through the year, but all runners should be picked off twice. They should be cultivated through the hot weather, and in August and September should be watered and cultivated, and as soon as cool weather comes in October they start blooming, and bloom right through the winter. This is the way the market gardeners grow them for the San Francisco markets and for shipping to Eastern States.

Sweet Peas—Pansies.

Sweet peas should have a support to run up on. I use chicken wire. The sooner you get in your supports the earlier they will bloom.

Pansies, to get large flowers, should be mulched now with about three-quarters of an inch of half-rotted cow manure, and later on mild applications of liquid manure once a week will insure three-inch pansies, provided you have plants from a fine strain of seed.

Goat's Milk.

A valued correspondent of the Rural Press, resident in Southern California, directs the attention of the writer of this column to the subject of goat's milk, and asks for an expression of opinion as to its value as compared with cow's milk. The correspondent in question becomes enthusiastic in extolling its virtues, an enthusiasm we cannot bring ourselves to share. It is quite true that some people speak well of the milk of the goat, and it is also true that there are many infants, and mature people as well, whose personal idiosyncrasy enables them to tolerate and even thrive on it; but we believe the preponderance of medical opinion favors the milk of the cow as against that of the goat. In the first place, goat's milk is too rich to be easily digested, more particularly by infants. In the second place, its odor is strong, and, to the uninitiated, its taste disagreeable, though it is claimed that the more recently imported Anglo-Nubian goat yields a milk free from this objection. Thirdly, while we are not familiar with the chemical and physical constitution of the ingredients of the goat's milk, we know that it has some peculiarity that very commonly causes vomiting and diarrhoea in those who drink it. Personally, we cannot drink it; we gag at the effort.

If goat's milk possessed the wonderful properties that some of its zealous advocates claim for it, it is rather strange that it has not come into wider public favor. Still, we are not disposed to condemn goat's milk outright, or indeed at all. It has its place in the dietetic economy of many peoples, and a most useful place. The goat is essentially the poor man's cow. It is not, however, in our opinion, a satisfactory substitute for pure, prime cow's milk, which is superior in palatability and digestibility.

Animals as Conveyors of Disease.

A noteworthy paper was read not long since by Prof. D. J. Davis, of the College of Medicine of the University of Illinois, on the diseases that may be communicated by animals and insects to man, the manner of their transmission, and some preventive measures. An abbreviated list of the diseases mentioned and the animals instrumental in their spread may interest readers of the Rural Press.

Dog—Rabies, foot and mouth disease, tapeworms, mange, fleas and ticks, ringworm.

Cow—Tuberculosis, anthrax, cowpox, tetanus (through vaccine), foot and mouth disease, septic sore throat, rabies, pus infection, milk sickness.

Horse—Glanders, rabies, tetanus.

Swine—Trichiniasis, tuberculosis, anthrax, tapeworm.

Sheep—Anthrax, tuberculosis.

Goats—Malta fever, tuberculosis.

Cat—Rabies, ringworm. Suspected: diphtheria, infantile, paralysis, scarlet fever, malaria, pneumonia.

Rats—Bubonic plague (through fleas), trichiniasis (through hog to man).

Ground squirrels—Bubonic plague.

"Hurry, children—I've got a real treat for you."

Ghirardelli's Ground Chocolate

is a fortifying food beverage for
all—from childhood to old age.

It comes PROTECTED—as all chocolate should—in ½-lb., 1-lb., and 3-lb. hermetically sealed cans.

FREE LANDSCAPING SERVICE

Service is becoming a great factor in every business, and the Nursery business is no exception. Many people who have both small and large places to improve are at a loss in many cases as to the plan to follow in laying out their grounds, and also in the selection of the trees, plants and shrubs, which will, as their place grows older, add to its beauty. In order to assist interested parties, we will on application mail you our SKETCH PLAN CROSS-SECTION BLANK, upon receipt of which you can make a rough sketch and mail to us, and our Landscape Department will send you a rough outline and recommendation for planting. No charge is made for this service.

Mosquitoes—Yellow fever, malaria, dengue (breakbone) fever.

Flies—Typhoid fever, infantile paralysis, and other infections carried mechanically.

It is hard to lay down any set rule or rules for the prevention of the animal-human diseases. As Prof. Davis says, much depends on the personal hygiene of the individual, care in matters concerning diet, the care of clothing, and the sanitary care of animals.

Irish potatoes and most other vegetables and fruits tend to make the body tissues and fluids alkaline so correcting the tendency of meats, eggs, fish, and similar foods to create acid conditions. The body performs its work best when it is neutral or slightly alkaline.

COFFEE

3 lbs. for \$1.00.

I sell from 20,000 to 30,000 lbs. of coffee every month. By buying direct from the growers, doing my own roasting and selling direct to the consumer, I do away with two middlemen's profits. That's why I can give you so much for your dollar.

Long's Best Coffee has a flavor and aroma that will win your instant approval. It is a blend of four mountain grown coffees, and hence high-flavored.

Long's Best Coffee Delivered to Your Door by Parcel Post.

Roasted the moment before it is sent to you. 3 lbs. for \$1.00.

LONG, the Coffee Man

LONG'S MARKET
11th and Washington Sts.
Oakland, Calif.

SAN FRANCISCO.

San Francisco, Feb. 14, 1917.

WHEAT.

Trade in wheat has been practically at a standstill during the past week. California Club continues as the most popular offering, but as yet no change in the top price of \$2.70 per cental has been reported.

Sonora wheat \$2.75@2.80
Northern club 2.70@2.75
Calif. club, ctl. 2.65@2.70
Northern Bluestem None offered
Northern Red None offered

BARLEY.

With the exception of feed barley, which is being shipped in large quantities to interior sections, this grain has been in little demand during the past week.

Seed, ctl. \$ 2.50
Shipping, ctl. 2.35@2.40
Brewing, ctl. Nominal
Choice feed, ctl. 2.25@2.30

OATS.

The only change recorded in quotations on oats has been a twenty-cent advance on Texas red seed stock. The announcement that this variety was to be had here led to such a buying movement that the price range was forced upward.

Red feed \$1.85@2.00
White 2.15@2.25
Red seed (Texas) 3.00@3.10

CORN.

A few of the lots of Eastern corn which were tied up in the Eastern snow blockade are beginning to arrive. The presence of a good shipping call led to a five-cent advance on sacked California corn.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, ctl., bulk \$2.15@2.22½
California, sacked 2.25@2.30
Milo Maize 2.00@2.20
Egyptian 2.25@2.50

BEANS.

Holdings of beans in first hands are now so depleted that the quoting of uncleaned stock on the wharf is no longer justified. It is estimated that not more than one-eighth of one per cent of last year's production remains in the farmer's hands, and the bulk of this small total is being held for seed purposes. What is said to be the last shipment of Lady Washingtons from Humboldt reached here this week and met with a ready sale at \$10.00. The quotations given below are for choice re-cleaned stock, f. o. b. San Francisco. Limas are in heavy call and have advanced nearly 75 cents per cental. There is also a heavy demand for southern small whites and large whites. Southern asking prices on limas today were \$9.50 per cental with local sales ranging between \$9.25@9.50.

[Recleaned, f. o. b. San Francisco.]

Bayos, per ctl. \$ 7.40@7.50
Blackeyes 5.25@5.35
Cranberry beans 8.25@8.40
Horse beans 4.25@4.50
Small Whites (south) 9.50@11.50
Large Whites 10.75@11.00
Pinks 7.00@7.75
Limas (south, re-cleaned) 9.25@9.50
Red Kidney 11.50@12.00
Mexican Reds 7.50@8.00
Tepary beans 8.00@8.50

HAY.

Increased receipts of hay for the past week not only failed to depress quotations asked here but sold out in good style at higher prices, as the result of a heavier demand. Arrivals were nearly 450 tons greater than for the preceding week. No relief in the form of rain came to halt the heavy call for hay from most of the interior sections. Reports from Sonoma county say that some green feed will be available within a month or so, but the Sacramento districts furnish just as pessimistic reports as were heard last month. Outside of the usual export trade, the city trade in hay has been very light. The few farmers who still have any alfalfa hay on hand refuse to name a price at which they will sell, because they may need it for their own use if dry weather continues.

[Price per ton, carload lots, San Francisco.]

Wheat, No. 1 \$19.00@20.50
No. 2 17.00@19.30
Tame oats 16.00@21.00
Wild oats 16.00@19.00
Barley 16.00@19.00
Alfalfa 15.00@18.00
Stock hay 15.00@16.00
Straw, per bale 8.00@1.00

FEEDSTUFFS.

Conditions in the country continue to rule in favor of higher prices on feedstuffs, especially for the more popular stock foods. Alfalfa meal is being held at \$1 per ton in excess of last week's figure.

[Per ton, San Francisco.]

Root Pulp, per ton \$20.00@31.00
Alfalfa meal, per ton 23.00@24.00
Bran, per ton 30.00@31.00
Oll Cake 40.00@41.50
Cocoanut cake or meal 31.00@32.00
Cracked corn 47.00@48.00
Middlings 37.00@40.00
Rolled Barley 45.00@46.00
Tankage 47.00@48.00
Rolled oats 45.00@46.00
Rice middlings 31.00@33.00

POTATOES, ONIONS, ETC.

While easier prices on onions are quoted in Seattle as the result of the putting on sale there at \$6.50@7.50 per cental of Japanese onions, the local trade seems to have discounted the chance that this imported stock will be offered on this market and prices continue to advance. Fancy onions were selling on the street here today at \$9.50@10.25, and ice house goods were being held for \$11. Receipts have dropped off to practically nothing, the

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted As Paid to Producers.

average for past week being barely fifty sacks per day. Potatoes are also one of the produce items that continue to gain in price and Delta Burbanks are now commanding as high as \$3.75 per cental. A few small lots of Salinas were put up for sale, but not enough to establish a quotation. Celery prices have declined under increased receipts, with lettuce holding firm. Tomatoes have been of noticeably poor quality and dragged at current prices, while a good shipping call figured in putting up the quotation on rhubarb. Lettuce, crate \$1.25@1.75
Celery, Delta, crate 1.50@3.50
do, Southern, crate 2.50@4.00
Tomatoes, crate75@1.25

Salinas Cleaned up
Oregon 3.00@3.90
Onions 9.50@10.25
Garlic, lb. 3@4½c

POULTRY.

Higher prices on poultry in the Eastern markets have tended to discourage shipments to this city and generally firmer prices have been the rule here. But two cars of Eastern were received last week and one is scheduled for this week, leaving the market pretty much to local offerings. Young stock has been commanding better figures. Turkeys are meeting with a somewhat heavier call and large fancy dressed fowls have been commanding as high as 29 cents. Squabs are scarce.

Turkeys, live, lb. 23@24c
do, dressed, large, lb. 26@29c

Squabs, per doz. \$3.00@3.50
Ducks 20@22c
Old 20c
Belgian Hares 13@15c

BUTTER.

Receipts of butter, especially from Sonoma and Marin county creameries, have shown a marked increase during the past week and easier prices have been the rule. Another factor in this weaker tone was the lighter call from Los Angeles, which only drew about 60,000 pounds from this market as compared with 100,000 during the preceding week. A few small shipments to Northwest points have been reported and the usual exports. The New York and Chicago markets do not warrant any shipping from this section.

Thu. Fri. Sat. Mon. Tu. Wed.
Extra 39 38½ 38 — 36 35½
Prime 37 37 37 — 35 35
Firsts 36 36 36 — 34 34

*Holiday.

EGGS.

Egg prices showed a small decline for the week, and only a heavy shipping demand preventing heavier losses. During the past week nearly twenty-five cars of eggs were shipped from here and Petaluma to Eastern and Northwestern cities. Chicago got the bulk of these shipments and is still buying here. Los Angeles drew on this market for one car.

The San Francisco Wholesale Dairy Produce Exchange made several changes in the rules governing the grading of eggs that will have considerable effect on future shipments. Hitherto, the grades known as extras and selected pullets were allowed to contain washed eggs, but this is to be changed. From now on the grade known as extras must be free from washed stock and goods which would qualify as extras except for washing will go into a new grade to be known as extra firsts. Extra pullets will replace selected pullets and must be free from washed eggs, while extra first pullets will contain the washed stock which formerly fell in the pullet grade.

Thu. Fri. Sat. Mon. Tu. Wed.
Extra 33½ 32½ 34 — 33 32½
Extra pul. 30 29½ 32½ — 30 29½

*Holiday.

CHEESE.

A very firm undertone continues as the ruling factor of the local cheese market with buying for Eastern shipment responsible for an advance on types of California offerings. During the past month California has shipped more than twenty-five cars of cheese to Eastern points, besides a normal export trade.

Y. A.'s 21c
Fancy Calif. Flats, per lb. 19½c
Monterey Cheese 16@20c

DECIDUOUS FRUITS.

The shipment of several large cargoes to the Hawaiian Islands, and a good local demand, resulted in further cut in size of storage holdings here. Quotations on both apples and pears were without change. Citrus offerings were all higher.

Apples:
Bellflower, box \$.60@.75

Pears, Winter Nellis 2.50@3.00

DRIED FRUITS.

Developments for the week were of a rather negative character as far as dried fruits were concerned. A few contracts for 1917 peaches were closed at 6 cents per pound and some dealing in prunes at 5½ cents was reported. Lake county pears are out of the market and stock from other sections has eased somewhat under a slow call. Sales of 1917 figs by growers at prices below those being asked last week were rather general, but in most cases these transactions can be traced to a need of ready money. The outlook for high prices on raisins is even bet-

Special Citrus Market Report.

Los Angeles, Feb. 13, 1917.

Shipments of citrus fruits from Southern California from November 1 to February 8: oranges 6,260 cars and lemons 1,391 cars. Same time last year, oranges 5,069 cars and lemons 1,440 cars.

The Florida crop of oranges being pretty much out of the way and not so many foreign oranges arriving, the markets East the past week showed more strength. Demand good and all highly colored of best known brands brought a little more money. Lemons too showed more life and at times were higher.

Locally the market showed a little more strength. Not so many culls coming in and the quality of the fruit better, which helped sales. Buyers bid-

ding 1@1¼c per pound in the grove picked. Grapefruit in very good demand and steady at 2c per pound in the grove picked. Tangerines continue slow sale at 1@2c per pound in the grove picked. Lemons show no change, they continue to drag. Packers still bidding 1@1¼c per pound in the grove picked. Poor stock has to be sold for what it will bring.

AUCTION SALES.

Boston, Feb. 12.—Fifteen cars sold. Market doing better on oranges and lemons. California navel averaged \$1.00@3.45. Lemons averaged \$2.30@3.85.

Philadelphia, Feb. 12.—Three cars sold. Market higher on oranges. California navel averaged \$1.95@2.55.

San Francisco May Have a Milk War.

While some middle ground may be arrived at satisfactory to all concerned, there is now a strong possibility of the most bitterly fought milk war ever recorded in San Francisco at contract fixing time next June.

The producers, through the Associated Milk Producers' Association, have materially strengthened their position since their contracts were made last June, with the result that they now have signed up for delivery after June 1, 1917, 24,000 gallons of milk daily. Of this amount they are marketing about 2,000 gallons a day in other bay cities. There are about 32,000 gallons consumed in San Francisco and 5,000 to 6,000 gallons of this are produced by distributors themselves.

With this supply assured producers feel able to enforce their demand for a minimum price of 16½ cents a gallon, with ¼ cent per gallon increase for every one-tenth increase in test over 3.6 per cent—the minimum test. This price was turned down by the distributors last June with the result that a minimum price of 14 cents is now being received by the producer, regardless of test, except that it must comply with the State law.

So insistent are the producers in their demand for the higher price that they threaten to enter the distributing field and if necessary resort to price cutting. Members of the association have offered the use of 150 vehicles for this purpose if they are required.

ter than before, with 62,000,000 packages sold in the East as compared with 43,000,000 at this time last year. All indications point to old crop being sold out before new stock is offered. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop 5½@6c
Apricots, per lb. 15@16½c
Figs, black, 1916 6@8½c
do, 1917 5½@6½c
do, white, 1917 6@6½c
Callimyrna, 1917 9@10c
Prunes, 4-size basis, 1917 5@5½c
Prunes, 1916 5½@7½c
Pears 6@7½c
Peaches, 1917 6c

RICE.

Local demand is practically nil on account of the low-priced offerings which are being forced on this market. There is some demand for New York shipments, but the freight embargo and the high all-rail rates make these prohibitive. Authentic reports from Louisiana say that there are four and a half million bags of the 1916 crop still in the growers' hands as compared to 1,373,000 bags Feb. 1, 1916. Local prices are still figured on a \$1.70 basis for best quality paddy.

LOS ANGELES.

Los Angeles, Feb. 13, 1917.

BUTTER.

Receipts of week ending Feb. 13, 1917—323,719.
Receipts of week ending Feb. 13, 1916—306,160.

There was a stronger tone to the market the past week. Consumptive demand good and receipts only fair and no stocks caused dealers to bid prices up the first part of our review week. By Saturday, however, the market began to show signs of weakness. Monday brought rain and better receipts than for some time and by Tuesday with San Francisco off 2c the market was sold off 2c, closing at 37c for extras and buying was only moderate at this.

We quote extra creamery 37c
Prime first 36c
First 35c

1917— Wed. Thu. Fri. Sat. Mon. Tu.
Extra ... 39 40 40 39 39 37

EGGS.

Receipts (railroads) for week ending Feb. 13, 1917—2000 cases.
Receipts (railroads) for week ending Feb. 13, 1916—1480 cases.

More in the past week and the shipping demand not so strong caused prices to work lower. The market by Friday had dropped 2c on extras and 3c on case count and pullets. At this reduction there was a very good consumptive demand, the lower prices encouraging consumption and the receipts were pretty well taken care of at the prices. Tuesday under liberal receipts and a lower market in San Francisco ranch eggs case count broke 1c and pullets ½c and demand only fair at these prices.

We quote fresh ranch case count. 25c
Extra 33 33 31 31 31 31
Ranch 32 32 29 29 29 28
Pullets 31 31 28 28 28 27½

1916—
Ranch 30 30 29 29 25

POULTRY.

The market the past week was hardly so snappy as the week before, the high prices curtailing consumption. Hens coming in more freely and weak. Broilers and fryers, however, in light supply and higher in good demand. Ducks slow sale and lower and turkeys quiet. The high prices checking consumption and causing buyers to go slow. Geese dull.

We quote from growers:
Broilers, 1½ to 3 lbs. 27@28c
Fryers, 2½ to 3 lbs. 23@24c
Hens, over 4 lbs. 20@21c
Hens, under 4 lbs. 17@18c
Ducks 18@19c
Geese 16@17c
Roosters, 3 lbs. up (soft bones) 22c
Turkeys, heavy, 12 lbs. and up 28@29c
Turkeys, light 24@25c
Squabs, live, per doz. \$1.50@3.00
Dressed 3.75@4.85

CABBAGE AND CAULIFLOWER.

A firm and fairly active market was had the past week. Cabbage continues under scarce and high, finding ready sale at \$3.50@4.00 per 100 pounds. Cauliflower too is holding up very well. Not much coming in. The season is drawing to a close. Demand very fair for what arriving at \$1.20@1.30 per standard crate to growers.

HONEY.

The tone of the market was firm under the influence of the tight stocks, but buying was light and only of such lots as needed for immediate use. High prices caused buyers to hold back and go slow.

We quote from growers:
Water white, pound 8½c
White sage, lb. 8c
Light amber sage, lb. 7½c
Light amber alfalfa, lb. 7½c

Ripe Olives Enjoy Good Markets.

Dealers in California olives are enjoying one of the best market situations that has existed for several years. The 1916-17 crop was short in itself and was further reduced in size by early frosts. As there was practically no hold-over of the 1915-16 crop, conditions are almost ideal in the disposition of this year's product.

The selling of olives on futures has been practiced in this State in the past, but packers who sold on futures this season find it exceedingly difficult to fill their orders. Because of this, and the short crop, the demand for olives is greater than the supply.

The Cal. Associated Olive Ass'n, who is packing the Serra, "the grower's brand," is not taking advantage of these market conditions in regard to increased price to the trade or consumer. Its policy is to maintain a uniform price, building its business along this line in the hope that an increased consumption of olives may result.

There has been a heavy demand for the reasonably priced canned olive, generally known as the "10-cent seller." Fully 50 per cent of the olives in California that previously went into oil are being processed and sold by the growers' association this year. The quality of these is the same as of larger sizes and if the consumer does not eat with his eyes he can get a goodly portion of olives for 10 cents.

There are two advantages in putting this size on the market; it educates consumers east of the Rocky Mountains as to the value of ripe olives and provides the growers with a remunerative market for olives that have heretofore been used entirely for oil manufacture.

Fancy white comb, lb.	10	c
Light amber comb	9	c
Beeswax	30	c

There was more inquiry the past week than any time since the opening of the new year. Receipts only fair and shippers and local buyers were both in the market. Prices were advanced sharply on limas, whites and pinks. Prices are not only higher but the advance has been maintained.

We quote from growers:

Limas	\$ 9.00 @ 9.25
Large white	11.00 @ 11.50
Small white	11.00 @ 11.50
Pinks	7.50 @ 8.00
Blackeyes	5.25 @ 5.75

Tepary	5.75 @ 6.25
--------	-------------

Receipts were again very good the past week and the market was draggy throughout. With freer offerings buyers held back; even the country was inclined to take hold less freely and values were weak. Prices, however, have not been marked down as holders felt that with a dropping off in the receipts that the surplus can be disposed of at current prices. Receipts 228 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$18.00 @ 22.00
Oat hay, ton	19.00 @ 21.00
Alfalfa, northern, ton	17.00 @ 18.00
Alfalfa, local, ton	19.00 @ 21.00
Straw, ton	9.00 @ 12.00

Special Livestock Market Report.

San Francisco, Feb. 14, 1917.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

CATTLE continue to be in great demand and price fluctuations are numerous. This is particularly true of steers, she-stuff quotations remaining unchanged on the theory that a continuation of the dry weather will force great quantities of this class on the market. What few prime baby beef there are in the State are being bid for; one feeder having turned down 10 cents for his entire offering last week.

Steers, No. 1	9 1/2 @ 9 3/4 c
No. 2	8 1/2 @ 8 3/4 c
Cows and Heifers	7 1/2 @ 8 c
No. 2	7 @ 7 1/2 c
Bulls and Stags	5 1/2 @ 6 1/2 c
CALVES, light	9 @ 9 1/2 c
Medium	8 1/2 @ 9 c
Heavy	7 @ 8 c

SHEEP trade is still pretty much limited to lambs because of the almost total scarcity of older stuff. Consumption has been materially reduced on account of the high prices. Killers are working on lambs from Idaho and Oregon this week and securing sheep from feed-lots. Idaho lambs are costing around 14 cents f. o. b. S. F.

Prime Wethers	9 1/2 @ 10 1/2 c
Ewes	8 @ 8 1/2 c
Lambs	12 1/2 @ 13 1/2 c

HOGS are marked up again notwithstanding the already high price level. Supplies continue to decrease in size and this, together with high-priced pork in Northwest and Eastern markets, makes a strong undertone to the market.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]

100 to 150 lbs.	9 1/2 @ 10 c
150 to 300 lbs.	11 1/2 @ 11 1/2 c
300 to 375 lbs.	10 1/2 @ 11 c

WOOL buyers report the Red Bluff clip pretty well cleaned up, the extreme high figure of 37 cents being reported. Buyers are still in the Bakersfield section but are finding it difficult to make any inroads on the growers' demands. There is some movement of wools in the East, but freight embargoes are holding up all California shipments. One steamer shipment was made via Panama this week.

Sacramento Valley, spring clip.

Mendocino, year's	22 @ 30c
Southern, spring clip	26 @ 28c
Southern, 7 months	13 @ 16c
Imperial Valley, 7 mos.	14 @ 15c
Nevada, year's	31 @ 32c

HIDES and leather are both in a healthier demand than they have been for some time. A report from the East says inquiries are more numerous than they have been and confidence is being restored. A break with Germany is expected to still further improve this condition.

Steers	21 @ 23 c
Cows	21 1/2 @ 23 c
Light hides, 25 to 48 lbs.	21 1/2 @ 23 c
Kip	20 @ 22 c
Calf and veal	29 @ 30 c
Dry Hides	32 1/2 @ 33 1/2 c
Dry Kip	35 @ 36 c
Dry Veal and Calf	38 @ 40 c
Pelts, long wool	\$2.25 @ 2.50

Short wool	1.25 @ 1.50
Horse hides, wet, large, ea.	5.00 @ 5.50
dry, large	3.00 @ 3.50

Los Angeles, Feb. 13, 1917.

CATTLE: There was a sharp advance the past week all along the line. The demand was only fair, but with a falling off in the supply of good killing cattle and strong and active markets East, caused killers to bid prices up in order to get what they wanted. California and Arizona furnished most of the supply and are giving us some good cattle for this time of year.

Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 to 1100 lbs.	\$9.00 @ 9.50
Prime cows and heifers	7.50 @ 8.00
Good cows and heifers	7.00 @ 7.50

HOGS: There was a dropping off in the receipts the past week, and as there was an advance in fresh pork and demand good, hogs ruled higher in sympathy. The Eastern markets kept up, which encouraged a higher market here. California and Arizona furnished most of the receipts with a few in from Idaho.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250 @ 300 lbs.	\$9.25 @ 9.75
Mixed, 200 @ 250 lbs.	9.75 @ 10.25
Light, 175 @ 200 lbs.	9.75 @ 10.25
Rough docked 20 pounds, piggy sows	40 pounds and stags 40 per cent.

SHEEP: With the Eastern markets high and the supply of fat sheep and lambs in the country light, killers the past week had to bid higher both for sheep and lambs. Even at quoted prices feeders were not anxious sellers. The general disposition being to hold as many sheep and ewes as possible until after the lambing and shearing season is over.

Per cwt. f. o. b. Los Angeles:

Prime wethers	\$9.00 @ 10.00
Prime ewes	9.50 @ 10.00
Yearlings	9.50 @ 10.00
Lambs	13.00 @ 14.00

CALVES: But few coming in and market and demand good. Selling at \$8.75 and \$9.75 per cwt.

North Portland, Ore., Feb. 12, 1917.

CATTLE: With a light supply of around 400 head on the market it can yet be called an active session at steady to strong prices. There was a fairly good demand from packers and especially from small butchers and all offerings were disposed of early. Best beef steers from \$9.00 to 9.25; the one load that brought \$9.25 was a prime load of yearlings averaging 1040 lbs. Prime killers both light and heavy sold at \$9.00; medium to good steers brought \$8.50 to 8.75; while the fair steers sold from \$8.00 to 8.50; common and ordinary valley steers brought \$6.00 to 7.00. There were only a few good cows available this morning although demand was limited; a few good cows brought \$7.50, with one small bunch of prime stuff going at \$7.70; fair to good cows sold from \$7.00 to 7.25. A few prime heifers brought \$8.00. The heavy demand for bulls during the last month continues and prices are gradually getting higher, one prime heavy bull brought \$6.50 with a few others at \$6.00, the bulk bringing \$5.50 to 5.75.

Stability

YOUR car is inseparable from the institution that built it.

The service it gives you is just what its producers build into it and *keep alive* in it.

In motor cars, stability of product is inseparable from the stability of the producers.

Overland ranks first among producers of cars above the \$400 class—second in the entire industry.

There are 400,000 Overlands in use.

Overland dealers have contracted for one hundred and eighty million dollars worth of Overlands for 1917—an increase of seventy-five million dollars compared with last year.

Overland sales this year therefore will be approximately as great as the entire annual gross revenues of the New York Central Railroad.

Overland net assets have grown from *fifty-eight thousand* dollars eight years ago, to *sixty-eight million* dollars today.

In our great Toledo plant and our allied plants, we employ nearly thirty-eight thousand men.

They directly support more than two hundred thousand people.

Permanent well appointed factory branches and parts depots representing an investment of millions have been established in important metropolitan centers that cover the country.

Big Four Touring, 112-in. wheelbase, \$850
Light Six Touring, 116-in. wheelbase, \$985

All prices f. o. b. Toledo

These branches serve the five thousand Willys-Overland dealers who complete our great international service system.

These tangible evidences of the stability of the Overland Industry are your best assurance of stability of quality and service in Overland Automobiles.

The Willys-Overland line is now *complete*.

And it is the only complete line of cars built and sold—

- under *one* executive management,
- with *one* engineering staff,
- with *one* purchasing power,
- by *one* production management,
- through *one* sales force, and
- one* group of dealers.

Resulting economies amounting to millions of dollars, reduce the cost of every car—enable Overland to establish and maintain higher quality standards at lower prices.

So in your Overland you get maximum quality at minimum price—plus stability to assure permanence of value in your investment.

You can select a car in the light four group, the big four group, or the light six group.

You can select one of the cars in the luxurious Willys-Knight group.

In either case it is dominant value in its class for it has shared in the economies of Overland bigness and stability.

See the Overland dealer now and make your selection.

Catalog on request. Please address Dept. 897.

LOS ANGELES

Some Observations on the Pruning of the Olive.

[Written for the Pacific Rural Press by Prof. F. T. Bioletti of the University of California.]

THERE is no new thing under the sun," said Solomon, the great sage of the Hebrews, and Professor Wickson evidently has this view about pruning, for in a very interesting talk recently, to a students' horticultural club, he gave the history of the development of the present Californian system of pruning deciduous fruit trees, and showed that this is practically the system described and advocated by Barry seventy years ago. Barry imported the system from France. It was probably brought to France by the Romans from Egypt, where it had been introduced by the Babylonians, who got it from the Sumerians.

Is it possible that the proper method of olive pruning, about which we are in such uncertainty, is common practice in Spain, or Syria, or Timbuctu? Perhaps; but there are many systems in these lands, and many more in others, and which, if any of them, is the best we can discover only by trial. The Barry method was not the only system in use in France when Barry wrote.

After reading much contradictory evidence and observing much diversified practice, it seems possible to recommend certain methods, which, while perhaps not the best, are at least good and safe. The following recommendations therefore are the result partly of theoretical considerations and partly of observations of Californian practises, and do not pretend to be authoritative.

Pruning Trees before Planting.—The olive, when planted with bare roots, should be treated in the way accepted for deciduous trees. As all the feeding roots are destroyed, necessarily, in transplanting, the young tree is incapable of obtaining water until it develops new ones. A severe pruning back of the top and removal of all the leaves is logical, and perhaps more necessary with olives than with trees naturally bare of leaves when planted. Leaves evaporate water and may desiccate and kill the tree before it can grow a crop of water-absorbing rootlets.

All branches, then, should be removed entirely and the main stem shortened to 15 or 30 inches, according to the size of the tree. To prevent injury to the bark by the direct rays of the sun, the stem should be whitewashed or shaded by means of a shade on the southwest side.

Pruning Young Trees.—The leaf is the feeding organ of the plant, and the growth of a tree is conditioned and limited by the amount of its foliage and by the length of time its foliage is active. A deciduous tree may make as much foliage, and this foliage may function for as many weeks,

if we prune it severely in the winter, as if we do not prune it at all. The case seems to be different with an evergreen tree like the olive.

Such a tree is indeed relatively dormant in the winter, and the food absorbed by the leaves is probably only sufficient for their own vital needs, as is evidenced by the cessation of new growth. When the warm, growing weather of spring arrives, however, the unpruned tree has more foliage than the pruned and commences to assimilate an excess of food immediately, and thus has an advantage of many weeks over the severely

pruned tree which has first to develop new foliage at the expense of the stores of starch and other food laid up in its branches, trunk, and roots. This is theory; but theory well supported by facts. There are trees four years old which are no larger than others only two years old, where the only difference of conditions or treatment is that the former were pruned severely every winter after the manner usual with the peach, while the latter were pruned very little.

A safe rule to follow, therefore, seems to be to prune only as much as is absolutely necessary to give the tree the desired form, and never to remove a twig or leaf that does not interfere with this object.

At the end of the first growing season, no pruning is necessary except the removal of strong shoots growing on the lower half of the stem where main branches are not desirable.

At the end of the second growing season, many trees will require no pruning at all. Some, however, will have developed strong branches in unsuitable places. These should be removed. Branches which cross from one side to the other, branches which are too crowded, or which interfere with the symmetry of the tree, or may interfere with cultivation, are misplaced. If there is a single strong central branch, this should be cut off at its base to promote the desirable open vase form of the main scaffold of the tree.

With Mission and other upright growing varieties, the problem is relatively simple.

With spreading varieties, like Manzanillo, it is difficult. In this case the best method is probably to drive a strong stake near the trunk, and by means of a rope tie up the spreading branches in the position it is desired to have them in the mature tree.

This method should be continued until the trunk, main divisions and branches are well established and the tree large enough to bear a good crop without injury.

(Continued on page 231.)

WELL-PRUNED OLIVE TREE READY FOR BEARING.

It should be noted that this tree has not been developed from severe cutting back in previous years. The appearance of starting branches in that way is due to the shortening of central parts of well-grown branches by cutting to laterals after considerable growth has been made. The next break of shoots will fill out the framework as much as is desirable.

A GREAT RAIN.

NATURE has been exceptionally crafty and cruel this season. She sang Sensation's siren-song, drew the weather-prophets out upon her barred-zone of pseudo science, and shot them all up without warning. We grieve for them; we weep copiously over them, as Nature is doing as we write on Wednesday. Fortunately, they are not dead, but soaking. Will they not dry-off wiser? We hope so, for they are now the great enemies of reason and resolution. Possibly what we say may be nonsense some day, but in our present light it seems forbidden to man to know seasonal rainfall in advance for the same reason that man is forbidden to know the span of his own life. If a man knew the date of his death he would be plunged into frantic fear, ecstatic anticipation, or insane pursuit of pleasurable sensations, as one or other of the mind and body forces contending within him should dominate. In any case he would fail of a man's part in the natural and social orders of creation. By the same sign, if men knew the insufficiency of a coming seasonal rainfall, which is the span of life of annual food production, productive effort would cease because man's bravery of effort, come what may, would be paralyzed and famine would ensue. Our philosophy may prove folly-love some day, but this rain is good, timely and ample—several inches of it from end to end of the State. Those who have not been diverted from timely work by the croaking of the prophets have placed themselves in the way of reaping rich rewards.

THE PRODUCER AND HIS PRODUCT.

ONE who has just awakened to interest in food production in this country, because his pocket is empty before he fills the needs of his family, is apt to do one of two things. He may suffer in mute discouragement or he may join a shouting-band of consumers and disturb the peace of suburban evenings with raucous cries about farmers' trusts—calling upon the State to cease promotion of producers' co-operative selling organizations, and to take acute measures to curb the greediness of the membership thereof. Both the mute-sufferer and the loud-shouter are wrong. There should be energetic effort of both of them to reach true understanding of the causes underlying undue inflation of food prices, and there should be clear and emphatic statement of the facts of such understanding so that the public may act intelligently and effectively for its own protection, and the advantage of all interests genuinely and legitimately involved. Such an attitude is easy to declare and very difficult to define. We can declare it; its definition and significance require economic research and interpretation of which we have no mastery—if indeed such mastery, based upon full possession of facts and logic in their interpretation, can be claimed by anyone at this moment. It is the duty of every one to think coolly and look confidently for the approach of such understand-

ing and mastery to emerge from the welter of agitation in which the issue is now plunged. They are sure to emerge, for the physical and moral welfare of the human race are dependent upon such emergence and upon public recognition of the truth. It is our notion that these indispensable achievements will approach along the line of the producers' relations to his product and discharge of his duties toward the equitable distribution thereof.

PRODUCERS' CONTROL FUNDAMENTAL.

WHEN the producer attains mastery, based upon full understanding, true interests will be served because it is only with the producer that maximum production with a fair profit is a fundamental, combined need and motive. If the handler's combined need and motive, greatest profit with least risk, prevails, it is a two-edged sword, drawing economic blood from both producer and consumer, and thereby robbing one of producing and the other of consuming force. If the consumers' combined need and motive (as now loudly and unreasonably urged) prevails, viz., to buy food at the lowest possible price, without regard to producers' cost of production, it clearly limits production, and thus, automatically, defeats itself. Therefore, the producer's economic requirement, which is maximum profitable production, underlies and insures his own increasing effort, the expansion of honorable commercial distribution and amply adequate and fairly-priced provision for consumers' needs. There are, perhaps, two ways in which this devoutly to be desired consummation can be attained. One is by governmental appropriation and apportioning, which is a paternal and socialistic arrangement, sometimes imperative in war, but offensively un-American in times of peace. The other is by co-operative organization, under laws enabling and regulating generously and wisely. As effective co-operation merely intensifies and multiplies the powers of individuals co-operating, and does not change their needs and motives, it is obvious that the only co-operation which will insure increasing production is a co-operation of producers, for they constitute the only class whose interests reach all the way through from the first planting of the seed to the last eating of the products and by-products of that planting. All this will be accomplished by producers' organizations, which will fix the price to the consumers. This they will do in the future much more largely than now by direct trade through improved parcels post, but they will do it first, and much more extensively, by fixing prices fairly above cost of production through quantity-distribution by their own selling agents at central points in all parts of the country.

TRUSTING PRODUCT TO SELL ITSELF.

AS WE have said on a previous occasion, it is our conviction that all schemes, based upon the idea that products will sell themselves, if ways are opened, are inadequate, and will prove ineffective. We believe ways should be opened and cleared of ruts and ridges, of course, and laws can be made to do that; but trusting to move masses of products by wheel-barrow which can get adequate movement only by 24-cylinder motor-trucks, seems to us childish, if not pitiable. By this we mean all those consumers' brilliant thoughts, which are now being forced upon public attention in connection with claims for State service in the interest of food distribution. All these are poultices for a sore thumb when the patient is really writhing with appendicitis. Operations are often required when troubles are organic and fundamental, or where obstructions are insoluble, or caused by organic displacement. This is the character of the conditions which have arisen to obstruct the full and free movement of food products from production to consumption. For this reason, and because we can only see regulation through insight and force along the line of the producer's relation to his product, we are very earnest in our advocacy of the measures now before the Legislature for the increased efficiency of the State Market Director in order that he may better proceed with his work of organizing producers to do work which, as we have argued, they

only can have adequate need-motive to do, and they only have the power to do. We are not arguing for Col. Weinstock; we are, however, trying to get behind and beneath him for a great push to his function. We admire him as a bright and energetic publicist, who has no other interest but the advancement of true and fair prosperity for all who deserve it, and whoever takes him for anything else, or actuated by anything else, makes a serious mistake. We support him because he represents what appeals to us as the only adequate and fundamental conception of the producer's relations and duties to his product, and whether he has handled his clippers for the abrasion of too many oranges, or whether he has fished for the hooking of sharks instead of salmon, is simply a matter of difference in judgment as to method. We support him because he is on the right road and on the only road which can come through, for the reasons stated. There are sidings on this road, which run in the same general direction as the main line, as sidings have to do, and such sidings are necessary and must be provided. But the present danger lies in the fact that many earnest and commendable people are running out on sidings, shooting steam and belching smoke and whistling crossings—apparently oblivious to the fact that unless they soon get back on the main line they will go into the ditch, a wreck of purposes impossible of attainment. For all these little local marketing arrangements, great though they appear and really are to those who wish freedom to buy and sell without the intrusion of local middlemen, are really only sidings of the main line which must be well surveyed and ballasted because it is the only line which can successfully cross the uneven country through which national development is impelling us.

CONTROL-SELLING NOT NEW IDEA.

WE HAVE to smile at some of the tantrums which mistaken people are performing in the public eye in the way of denouncing producers' control organizations as a new and trustful idea in California agriculture. They are, of course, rather new in successful and effective organization, but they are nearly as old as this American State in conception, earnest advocacy, and in recognition of their indispensability to the full development of California. Some day we shall take space to trace the idea from its humble birth among the pioneers to its present distinguished achievements. It was a very lamb-like idea at first, which was, perhaps, due to its first dawning on the wool-growers of the '50's, but it was pastured by the wheat-growers of the '60's; was given a little something for its stomach's sake by wine-growers in the '70's; consequently gamboled seductively before the fruit-growers of the '80's; butted into preliminary deeds in the '90's; and began to spear something notable in the first decade of the new century. It is, therefore, a fact that California producers have been trying to adjust their relations to the parting from their product for half a century, and have thus been growing toward maturity in their understanding and action all this time. During the last few years they have advanced rapidly, and have worked wonders, rescuing their enterprises from bankruptcy by the only possible way, which is to price the goods and regulate their distribution. In the fullness of time came the State Marketing law of 1915, which placed the State in sympathetic, helpful and promotive attitude toward the realization, for the whole people, of the producers' need-motive relation to food production and distribu-

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., February 20, 1917.

STATIONS	Part Week To Date	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka57	17.33	29.58	58	26
Red Bluff14	11.30	16.57	74	34
Sacramento	1.02	7.60	13.19	72	38
San Francisco74	11.26	15.45	73	42
San Jose40	7.10	11.08	74	34
Fresno56	5.79	6.13	68	38
Independence
San Luis Obispo	2.40	17.73	12.98	68	32
Los Angeles	1.30	11.24	10.34	70	42
San Diego80	7.80	6.63	66	44

tion. And now by proper amendments to that law to make it more practicable and forceful, there will appear State economic highways leading to fair trade in food products, as well graded, disposed and constructed as the geographic highways which are making California famous.

PRODUCERS HELPED BY ECONOMIC ENGINEERS.

IT IS important to state for the benefit of those who are themselves so new that they look upon product-control by producers as a new thing in this State, that the degree of success which has thus far been attained cannot be credited wholly to self-help by producers themselves. Many Californians, who had themselves carried through great enterprises in other lines, were quick to see, thirty or forty years ago, that the capacity of California for unique agricultural products could only be utilized by co-operative organizations of producers to regulate and promote the handling of such products in a large way, for which producers alone have the proper need-motive, as we have claimed. In the '80's this force of suggestion from analogy, drawn from wisdom born of success in other commercial and financial achievements, was freely applied to the upbuilding of the fruit industries, which have thus far been our greatest field for producers' co-operation. Readers must take this fact largely by declaration, for we have not space at this moment for demonstration. It was in the '80's that David Lubin took his first step from commerce to agriculture—in a forward march for the latter industry, in the course of which his footfalls have been heard around the world. We hope to live to sketch the course of this great California economic sage and philanthropist—but not now. Let us draw instead a single incident from the life work of another Californian—a typical illustration of what we have in mind.

At the beginning of overland fruit-shipping, and for years afterward, the freight rates were fierce. To the growers they seemed the blackest scowl on a frowning sky, and perhaps they were, in a way, but they taught a valuable lesson. The fruit was being wretchedly handled all the way from the tree to the push-cart in Eastern cities—growers and shippers at this end were broken up. The railways got their money first; apparently, it made no difference to them whether the fruit on arrival was fit for a cut-glass receiver or a swill-tub, and it made the growers very sore. The situation was mixed, but out of it came one rather clear gleam, and that was that the fruit could go through in average good condition. The first run of Eastern dealer-shippers went on the rocks. The second run learned better handling, and cleaned up millions for themselves by systematic handling—still some of them feared that too much fruit would get through. It was natural enough, for they were ruled by the dealers' need-motive; to buy low and sell high, and crush out quantity which would kill high prices. Under such conditions, of course, there could be no adequate development of California fruit industries, because the producers' need-motive could not be realized; there could not be expanding consumption. But the growers at that time only dimly saw that fact, and they kept hammering away at the freight-rate, which would have been rational if they had not ceased with that effort.

RAILROADS HELP THOSE WHO HELP THEMSELVES.

IT WAS at a time of such a welter of things that William Sproule, now president of the Southern Pacific Company, was a young man, and incumbent of some position in the freight department—just what we do not remember. It was also a time when the old "all the traffic will bear" policy was getting feeble, and a better attitude of transportation to production was dimly dawning on the horizon of railway management. There was an assembly of fruit growers in San Francisco, and the sore thumb of extortionate freight rates was held aloft. "If we could get the railways to meet us face to face, there might be something done," was a suggestion of some hopeful soul, and so a committee was sent to the Townsend street trenches with a flag of truce ask-

ing for a parley. A railway speaker was promised for the afternoon session, and many of the growers doubtless forgot their lunch, they were so busy thinking of things to say that would cut-up the corporation. In the afternoon Mr. Sproule appeared and spoke simply and gracefully about the mutual relations of transportation and production in the building-up of the industries of the State and the prosperity of individuals, and the duties of both toward each other and toward the ends in view. Then he spoke more particularly of fruit shipping and freight rates. Rates had already been considerably reduced since shipping began, and for all he knew might be farther reduced as shipments increased, but he desired growers to realize that a possible reduction in freight rates would not meet their difficulties. If it were secured they might lose it by lack of proper handling, or some agency of distribution might take it away from them. Experience has shown that the fruit is not well handled for its own good or for theirs, and he suggested, respectfully, that if growers would organize, getting together themselves and their products, and dealing more directly with transportation and distribution, they would begin to realize that the reduction in freight rates which they might secure would not be their greatest gain.

This speech of Mr. Sproule, of which we grasp but a few points from our memory, stampeded to silence the ugliness with which many growers began to hear it. One old friend said to us: "I know why the railroad sent Sproule; it was because he could scold us in words that sounded like poetry." But that was not the significance of the incident, which was in its effects, and we use it simply as an illustration of the fact that all along the course of California progress toward efficient co-operation of producers for product handling, strong promotive influence has been exerted by men who have been successful leaders in modern business organization in other lines. It is undoubtedly true that much of the success of co-operative organization in this State is due to the advice and influence of such men. Such promo-

tion has now been accepted by the State as its proper function.

A WORD FROM TODAY.

WE HAVE gone back a few decades to show that the control-organizations of producers are not new in this State, and that they are, in a sense, a product of our whole citizenship. It has advanced by evolutionary processes, and it is still on its way, with self-help and outside influence not only still strong, and it is each year nearer the mastery which every consumer needs for his own comfort and prosperity. At the notable meeting recently in Pittsburgh, called the "Fourth National Foreign Trade Convention," B. F. Harris, who is both a farmer at Champaign, Ill., and president of the First National Bank of Chicago, made an address in which he said this:

"For fifty years the farmer has been feeding the people of the United States at less than the cost of production, throwing in his, and his children's, and the nation's birthright of soil fertility. He is the solitary producer who has no voice, and though properly rebellious, has in no successfully organized or concerted manner sought voice in the pricing of his products, and those who set the prices for him know little and care less as to the actual cost of production, nor of the wastes that lie between.

"High prices do not represent the 'farmers' greed,' for he is almost an innocent bystander, buffeted by seasons and market-makers, his share of what the consumer pays sometimes looking like '30 cents,' and not infrequently he works 16 hours to provide food for the 8-hour fellows. He is not a tradesman; and co-operative plans, with government help in stabilizing market situations, are required."

As one thinks seriously of these things, can it be doubted that what we need is proper adjustment of the relations of things, especially the producer's relation to his product until it reaches the consumer. And as one does think of this, how good in their way, and yet how unpromising and inadequate, are the little local marketing provisions which some people seem to think the chief business of the State!

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Failing Apricot Trees.

To the Editor: I have apricot trees four and five years old which have the bark cracked a little above ground and for 18 inches up. The wood at that place is apparently dead and I have cut off some dead links. What is the cause and what can I do for this trouble? The trees have never been sprayed. Should 'cot trees be sprayed, and what kind is used?—W. A., Hanford.

It looks like a case of sunburn, for one thing. Whitewash up as far as the sun can strike the bark. You should have done it as soon as planted and have repeated enough to keep them white unless fully shaded by the top growth. Too much dead limb is a bad sign, but one often has to cut some dead limbs from trees otherwise healthy. Too many dead limbs may mean alkali or mud below or too dry soil—anything which injures the roots is apt to make dead tops. Like other trees, apricots should be sprayed if you know what you are spraying for, and the kind of spray depends upon that also. Get some neighbor who knows about fruit pests to look over your trees and tell you if he finds anything to spray for.

How Much Water and When?

To the Editor: How many times a year should Muscat vines be irrigated in a district where surface water is about 50 feet deep and only four or five inches rainfall a year? How deep should the ground be wet each time it is irrigated? How many cubic feet of sandy loam will one cubic foot of water wet?—Subscriber, Hanford.

We are very sorry such questions are incapable of definite answer. The needs of a grape vine are conditioned upon the thirst of the air in which its growth has to be made, and the amount it can get from the soil after irrigation depends upon how long the soil will hold it from going beyond the reach of the roots by flying or running away—even if you do the best you can to reduce flying away by perfect surface cultivation. The number

of cubic feet of soil a cubic foot of water will wet depends upon the character of the soil and there are enough kinds of "sandy loam" to make any theoretical calculation a misfit for most of them. Besides, for any particular situation such as you have in mind, the thing to know is not that the ground water is 50 feet down but whether there are or are not layers in this 50 feet which will hold water so the roots can reach it or whether it is open and loose all the way down so that the water will run down so fast that roots cannot catch it. If there is a hardpan layer at, say, three to five feet you can get a crop of grapes with five monthly irrigations of, say, four acre inches each time. If the thing is all open below you may need to put on four inches a week for five months or longer—until you fill up the country below and then you may be able to grow grapes without any irrigation at all. Get an idea then of what kind of subsoil you have; get a good head of water; wet down the land well now, plant the vines as soon as the soil works well; keep making prospect holes for subterranean mud and keep putting on water so long as you find no mud below and the vines look as though they were enjoying the climate above. Keep notes of your operations with dates and quantities and you can soon see what practice will give you best results. Most that we now know about irrigation has been learned by irrigating.

Testing a Suspected Fertilizer.

To the Editor: Has unburned lime rock which smells very strongly of sulphur, any value as a fertilizer?—Subscriber, Lake county.

There are two ways to find the answer to your question. One is to have an analysis made; the other is to give some plants a good dose of it and see how they act.

Liquid for Citrus Fumigation.

A safe, effective, less expensive system with a simpler machine, is being tried in Southern California with equal killing effect and no damage to trees, fruit, or tents.

[Written for Pacific Rural Press.]

As far ahead of the fumigating machine as that is ahead of the old fumigating pots and troubles, seems the new means of fumigating citrus pests which has been tried out in various parts of Southern California during the past season. It reduces expense of operation, does no damage to trees, fruit, or tents, leaves no residue to damage the soil, and in these days of scarce cyanide, it is claimed that lower grades of that chemical may be used. No heat is generated in the whole process of fumigation. The process consists in spraying into the fumigating tents liquefied hydrocyanic acid gas which contains far less water than is used by other means. The khl is pronounced equal or better than by the common fumigation.

We observed a fumigating gang using the "liquid gas" in the Reed grove near Claremont one night recently. The machine, loaded with 32 pounds of cyanide in the liquid form, weighed only 32 pounds total, for the liquid weighs considerably less than the cyanide used in the making of it. A metal tank holding two or three gallons had been fastened horizontally on legs some 10 inches above a board. A hole drilled through its upper side admitted the liquid, which is carried in what seems to be a common 10-gallon oil can. From one end a pipe leads to the bottom of a vertical graduated glass tube set on the board at the end of the tank. A stop-cock admits the liquid at will. While we were watching, the "tree stepper" was also calling the dosage, by reference to a chart, and recording it. When 8 ounces of cyanide were indicated, liquid was permitted to fill the tube to the figure 8 on the graduate. The tube was connected by pipe to a brass hand-pump like a bicycle pump, also fixed vertically to the board beside the tube. Pulling up the handle of the pump withdrew the liquid from the glass tube. Pushing down the handle forced it out through two feet of small piping on the end of which was a double-angle nozzle from an ordinary spray pump. This of course had been inserted under the tent. The spray was forced upward among the leaves and somewhat against the tent. Aside from this, other operations are about the same as usual.

The liquid is non-corrosive, does not damage tents or clothes. We dipped our fingers in it at the invitation of the fumigators. Only the smell of it is harmful—anyhow, you don't want to breathe the vapor. On this account, a small rubber hose runs from the upper end of the pump along the pipe to the nozzles to take care of any gas that might collect in the upper end of the pump.

What Has Been Done.—The work at Claremont has been under direction of F. G. Wyman of the Growers' Fumigation and Supply Co. Four hundred pounds of cyanide and enough sulphuric acid were furnished to Dingle Bros. (to whose work the present progress is mostly due), and Messrs. Dingle made it into liquid

for less than the ½ cent per tree royalty now exacted from users of fumigating machines.

Early in December, according to Mr. Wyman, 180 trees were fumigated with the liquid in a 10-acre block, the rest of which was fumigated with a machine. No difference in killing effectiveness was found by the inspectors, though at Upland a better kill was found where the liquid had been used. No damage was done to trees or fruit. On February 6, 7, and 8, seven and a half acres were fumigated with liquid in the Reed orchard, on which the results are not known at this writing.

Economy.—According to Mr. Wyman, where equal weights of sulphuric acid and cyanide are needed to make the liquid, 1.7 pounds sulphuric acid are required per pound of cyanide in ordinary fumigation. To this saving, add the cost of the horse required for the usual machine. The new machine is carried by its operator. Where the horse and machine-wheels knock off considerable fruit, that is all saved by the new method. If less pure cyanide can be used, there is a substantial saving. Mining cyanide is being used. The saving in clothes and tents is a very important item, for there is often a great deal of patchwork to do on scorched or burned tents, or gas is lost and the kill reduced.

Limitations.—The gas is liquefied by compression and refrigeration; and any time its temperature goes above 85 degrees F., it is likely to give off fumes. At 110 degrees it was said to be explosive, but the men were working around it with open flames.

It is said that the railroads do not want to handle it yet. Nevertheless, machinery for manufacturing the liquid is not so expensive but that a plant can be located anywhere within hauling distance of the orchards that are to use it. There is talk of such a plant at North Pomona. Most of the liquid is now made at Azusa.

The usual precautions to avoid damage from too heavy doses are required; and fumigation must cease when dew or rain gathers in drops on the fruit. In that case the fruit would burn, though the leaves are not affected if thus wet. It requires a little more time to do the work than with a machine of the usual type. As the system has not been tried out for very long, it is well to watch its results carefully before taking it up so extensively as one who knows its nature is tempted to do.

A mealy bug which resists the strongest fumigation that a tree can stand has been found on a very small acreage in Riverside county. A meeting of the State Horticultural Commissioner with the county commissioners of southern counties was held at Riverside February 6 to decide on methods of eradication, since control has been found impracticable in other counties where this pest is more widely found.

Preventing Crown Gall.

[Written for Pacific Rural Press.]

It is pretty well established that crown gall does not affect uninjured roots. One way to prevent crown gall, then, is to prevent injury to roots or to apply a reasonably permanent disinfectant. This latter can be done to the cut end of roots in planting trees; and there should be no scraping of their bark by tramping dirt around the roots with the feet, either in planting or in heeling in. Dirt can be settled without danger by water.

Using Apricot Roots.—In the Banning section of Riverside county, a determined effort is being made to overcome crown gall. One of the most successful of the growers is F. M. Butler, who has observed that the apricot root is very resistant. He has 1200 almond trees on almond and peach roots, 750 peach trees on peach root, and 500 apricot trees on apricot root.

The apricot roots are almost immune, while the other roots were severely infected until he cut off the galls, as told elsewhere. So Mr. Butler says if he were setting out another orchard he would use apricot roots if he could find a way of double-working almonds on them. Reader, drop the Pacific Rural Press a postal card telling of your experience in such double working. But do not be sure of apricot immunity.

No More Plowing.—Mr. Butler has observed that a moldboard plow spreads crown gall by the wholesale. After cutting through diseased wood, it tears up healthy roots and infects

them, either with germs it carries or with those in the ground about the broken root.

Mr. Butler has had his plow catch under roots too big to break. The plow has knocked off bark on the underside. He has marked such places and watched for three years. He has found big knots characteristic of crown gall on the undersides of these roots where the bark had been knocked off and as much as four or five feet from the tree. Some knots at that distance have been found big as one's head.

To prevent this it is well to follow the example Mr. Butler has observed around Rialto and Riverside. He has seen fruit growers there work down heavy cover crops by use of disk harrows alone, and mix them with the soil. Next season he proposes to double disk his orchard about three times to get it in as good shape as the plow and harrow would. The double disk is preferred, one following the other two or three feet, because it leaves the ground level for irrigation.

Where a plow would split or tear up roots, the disk will roll over them or make a clean cut. Where the moldboard would leave a plowsole, the disk does not even disturb the roots, for it will go three or four inches deep instead of six. It will not turn up any clods, nor bury them to dry out the soil and be unavailable. The harrowing will be avoided, but all later operations will be carried on as usual.

Has the Soil Water Enough?

To the Editor: In September of last year I had some moisture tests taken in my 20-year-old prune orchard after the crop was taken off. Tests were taken out of each foot to a depth of six feet, in several places in the orchard and in soil ranging from light gravel to a rather heavy loam. The orchard was plowed deep and well cultivated during the summer and the tests averaged: for the 1st foot 7.76 per cent; for the 6th foot 14.81 per cent, and the highest for the 3rd foot, 16.41 per cent.

I would like to know if you think this sufficient percentage of moisture to place trees in good condition for another year. If not what would you consider a sufficient amount?—Subscriber, Gilroy.

[Comments by Prof. Frank Adams.]

Commenting on the enclosed letter from your subscriber at Gilroy, I would say that we have made no moisture determinations of soil in the Gilroy neighborhood, but judging from investigations in Sacramento Valley with soils of a similar nature I would express the opinion that, in view of the light rainfall for this season, the means for supplying additional water by irrigation should be provided if possible, although it is not at all likely that additional

moisture is needed at this time. Although the percentages of moisture found last September would seem fully adequate for that time, the grower should bear in mind the fact that the "wilting percentage" of rather heavy clay loam such as he describes may be as high as the maximum percentage found. He will, of course, understand that it is only the moisture above the wilting percentage that is available to the trees. From my meagre knowledge of the soils about Gilroy it would be my suggestion that this orchard be watched very carefully for evidences of deficient moisture later in the season, unless of course we have a much heavier rainfall during the rest of the season than we are accustomed to count on.

Berkeley.

[And we would enforce the suggestion of Prof. Adams by reference to the good old rule: "When you are in doubt, take the trick." That is: if you are thinking of irrigating by pumping to supplement a possibly short rainfall, do it now and think about it afterwards.—Editor.]

FRUIT FROM OLD ORANGE TREES.

Oranges from trees sixty years old are to compete at the Seventh National Orange Show in San Bernardino, February 20 to 28, with fruits from the modern-day orchards. The oranges from the first trees planted in San Bernardino valley are to be used to demonstrate that the length of life of the orange tree in California is yet unknown. The trees were secured in Los Angeles in 1857 by L. Van Luven, pioneer settler of San Bernardino valley, and planted at old San Bernardino. It is believed the trees were from the stock planted by the mission fathers at San Gabriel, probably about 1800.

plant Germain's proven seeds!

Take no chances—insure absolutely perfect results by planting Germain's thoroughly tested seeds. Germain's seeds are specifically adapted to southwestern soil and climatic conditions. A half-century of successful experience in seed production is the record of the Germain Seed & Plant Company. The people of the great Southwest have learned to depend upon Germain's seeds—and Germain's seeds ONLY—for perfect planting results.

Join Together for Apple-Spraying.

[Written for Pacific Rural Press.]

Apple growers in the Yucaipa district ordinarily have only five or ten acres; yet they must spray; for the county hires a man in connection with the Yucaipa Apple Growers' Ass'n to inspect orchards and insist on spraying wherever needed. That is everywhere when codling moth time comes.

Until the present season, there has been very little fruit that codling worms could attack, and most of the spraying has been done by commercial sprayers. This season, several associations of growers are getting together to buy power spraying machines and materials co-operatively. There are already 24 power sprayers in the valley.

One such association had as its moving spirit A. B. Ward, who takes care of some orchards besides his own. Six orchard owners having about 40 acres just coming into bearing, are represented. They paid \$422 for a machine on the basis of one acre per share. It was agreed that if two or more should want the machine at once, they would cast lots for first chance. Since one man owned 10 shares he would be at a disadvantage in a chance of one lot per man; so it was thought well to give him two lots, allowing the use of the machine on five acres for each. Thus, he would probably not have the machine for all of his orchard at one time, allowing it to circulate faster.

The labor and material cost is charged to each orchard separately, because one's trees might be larger, or he might require more thorough or more frequent spraying than some others.

A secretary was elected to keep accounts for all the orchards. The cost of labor is placed at \$5 per day for a man and team and \$3 per day for each of two hose men. Prefer-

ence is given to share owners in hiring the help.

Bids on Spray Material in bulk were asked of three companies, the best offer to be accepted. The sprays now being bought are arsenate of lead powder, twice as much weight of whale oil soap to make the arsenate stick better, and atomic sulphur to mix in for fungous diseases.

CURED CROWN GALL.

[Written for Pacific Rural Press.]

Probably the greatest problem of almond growers in the Banning district of Riverside county is crown gall. The ground is said to be naturally full of the organisms that cause the disease, the wild growth being affected. Much money is being spent to cure it. The general method is to dig away the dirt, chisel off the galls, and disinfect the cut surfaces.

F. M. Butler, who has 1200 almond trees and about 750 peach trees, is one of many who have done this, and one of the most successful. Four years ago he found about 56 per cent of his trees "knotted." He dug around each tree and when crown gall was found, a hole big enough to get at all of it with a small chisel was dug, and the knots cut off back into sound wood. Many knots were found on the tap roots under the fork of the other roots; but they were mostly near the surface and on top of main roots.

After cutting heroically, a Bordeaux paste was applied to all cut surfaces so strong that it would turn the wood yellow as if it had been seared. A man could treat about 60 trees per day.

The affected trees have been inspected every year since; and Mr. Butler believes that not over four per cent of the galls ever started to grow again.

Economical Pumping

—Can only be accomplished by the use of efficient Pumping Equipment.

Alpha Distillate Engine.

AN EFFICIENT ENGINE is one that will not only continue to develop the full amount of power required on the smallest consumption of fuel, but will also require practically no attention during operation. It must be free from repair expense and the possibility of a breakdown during the pumping season.

Alpha Distillate Engines and Viking Rotary Pumps

Make Efficient, Reliable Pumping Plants

All Alpha Engines are equipped with a high-class, built-in, gear-driven magneto; they start on the magneto without cranking, and the use of batteries and coils is entirely eliminated. Built in all sizes from 1 1/2 to 100 H. P.

VIKING ROTARY PUMPS

—an ideal irrigation pump

VIKING PUMPS will deliver more water per minute for the same amount of power used than any other type. Its very high efficiency is due to its positive delivery, its simple design and careful manufacture. It is SELF PRIMING, requiring no foot valve or priming pump and easy to install. Investigate the Viking Pump.

Built in all capacities from 20 to 1600 gallons per minute.

Viking Rotary Pump.

Send for complete catalog of both Alpha Engines and Viking Rotary Pumps. They are yours for the asking. Now is the time to consider pumping equipment.

OBSERVATIONS ON PRUNING OF THE OLIVE.

(Continued from first page.)

This condition may arrive by the end of the third growing season, or may be deferred to the fourth, fifth or later, according to the variety, soil, water, climate and system of pruning. The formative period is then practically over and pruning adapted to bearing trees should be adopted.

Pruning Bearing Trees.—At this point the theory begins to weaken. If Barry were still alive we might ask his advice.

In some countries they treat the olive as a wild tree. It receives attention only at harvest time, with the result that no trouble is experienced with over-production. In others it is cut back to the main branches once every four or five years. The yield of stove wood is excellent, but the crops irregular. In some parts of France and Italy a regular annual pruning is practiced. These parts produce the best crop.

The exact method of pruning, however, does not seem to be quite clear or uniform. In a general way, the idea is to open up the tree and preserve the vase form, so that the conditions for fruit production may be favorable over as large an area of the tree as possible. To do this, it is necessary to cut out branches and twigs wherever the tree appears too dense to allow of free penetration of the sun rays. Each branch removed should be cut off at its origin or at a point where a side branch occurs which it is desirable to leave. This applies also to small branches and twigs.

Cutting-back or shortening-in should be used with moderation. It has a tendency to produce a dense center and the growth of vigorous upright sterile shoots and gradually a high-headed tree. It should be used only where necessary to stimulate growth of a weak tree by removing fruiting wood or to prevent horizontal branches from becoming too low.

The photograph shows a tree treated according to these ideas. It is a Mission planted at Natomas in the spring of 1914 by Mr. E. K. Carnes and pruned according to his directions.

The photograph was taken in December, 1916, immediately after the tree had been pruned. It represents, therefore, the pruning of a well-grown tree at the end of the third growing season. The pruning has been limited to cutting-out or thinning of ill-placed branches and no cutting-back has been done. Such a tree is of excellent shape and may be expected to yield a good crop the coming season.

ALMONDS IN ARBUCKLE DISTRICT.

To the Editor: Is the land three miles west of Arbutle adapted to almond growing? How many trees should be planted to the acre? What are the best varieties to plant? Under favorable conditions how many pounds of nuts should each tree produce the first year of bearing? The fourth year?—W. J. G., San Francisco.

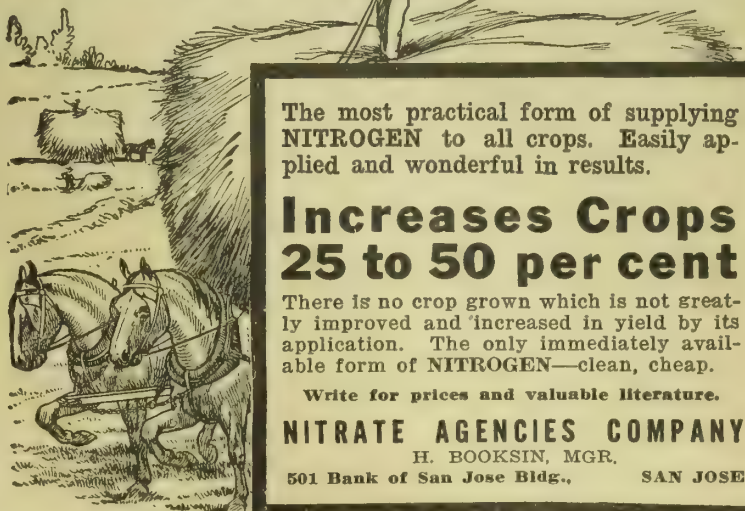

[Answered by Fred S. Schultz, Arbutle.]

Yes, the land in that district is

suitable to almond culture. I would advise planting not less than 50 or more than 60 trees to the acre. I would prefer to plant a row of Texas Prolific between two rows of Nonpareils. You should not count too much on the fourth year, although two small orchards here have made

\$100 an acre the fourth and fifth years. Five to eight pounds per tree would be good for four and five year trees. Trees in full bearing will average \$100 to \$150 per acre yearly. On account of the slope in land west of here there is practically no danger of frost.

Nitrate of Soda

The most practical form of supplying NITROGEN to all crops. Easily applied and wonderful in results.

Increases Crops 25 to 50 per cent

There is no crop grown which is not greatly improved and increased in yield by its application. The only immediately available form of NITROGEN—clean, cheap.

Reliable!

The BEAN is reliable—dependable! It represents over 30 years of study and experience. It will stand up to the hardest work day in and day out—week in and week out—and that's the kind of a sprayer you want. BEAN reliability is a feature of all

BEAN Power Sprayers

from the sturdy little one-man, one-horse Eureka to the big Bean Giant Triplex, which fairly eats up the work. The BEAN is reliable because every part and detail is reliable:

- BEAN AUTOMATIC PRESSURE REGULATOR holds the pressure at exactly the desired point. It never fails.
- BEAN THREADLESS BALL VALVES never stick or corrode tight—and they can be opened up in a few seconds without stopping the engine;
- BEAN PORCELAIN-LINED CYLINDERS will outlast the pump;
- BEAN ECCENTRICS are much more durable than cranks;
- THE STURDY NOVO ENGINE AND THE BEAN PUMP (the only pump without a stuffing-box) require practically no attention.

Spray now! See your nearest Bean dealer—or mail the coupon to us—at once.

Budding Citrus Seedlings.

[Written for Pacific Rural Press.]

When the bark slips nicely on the stocks, and when the weather is likely to be clear and warm, is the time to bud citrus seedlings, according to Randall Bros., who had last spring 11 acres of budded seedlings in the hills near Whittier. The buds ought to "take" fine when sap is flowing vigorously on warm days in February and March. H. A. Randall claimed to be able to bud an average of 1300 seedlings per day and had budded 1600 in 9 hours.

Fat buds on plump sticks are selected. Long narrow buds make it hard to close the bark evenly over them, as is very necessary. Leaf stems are left $\frac{1}{4}$ inch long when cutting bud sticks, for convenience in handling the buds.

The transverse cut on the young stock was made with the edge of the blade sloping upward, and the vertical cut made upward from that, so there would be every chance to shed rain. Buds were inserted six to eight inches above ground to help avoid gum disease, especially with lemons, for the stocks are resistant.

Having cut the bud and started it immediately, the knife point was stuck crosswise into the bark below the bud so it could be quickly shoved

to place. If any bud was dropped, it was thrown away if there were any chance of its being dirty.

A strip of waxed cloth a foot long and three-eighths inch wide was wrapped around each bud covering it unless it was so prominent the cloth might injure it. The covering prevents undesired shoots before the union is firmly made. Such shoots might rob the uniting cambiums of needed sap. Two wraps were made below the bud, letting the end of the strip project between the two. The third wrap was made above or over the bud and after another wrap or two, the job was finished by twisting the ends together. Thus the cloth also would shed water from wrap to wrap.

In about 20 days, more or less, according to weather and the consequent early starting of bud shoots, the cloth was taken off. Buds which had started to grow were in danger of having the shoots broken off.

Sprouts from the seedlings were rubbed off three or four times the first year after budding. Ground for nursery trees is changed every four years. This 11 acres was located in a grain field to avoid all possible chance of disease.

Fruit Confidence Increasing.

[Written for Pacific Rural Press.]

"The demand for deciduous nursery trees has been stronger in Northern than in Southern California," says J. S. Armstrong of Ontario. "The reason is probably the greater confidence in the future, inspired by growers' organizations. There is a much healthier feeling in all lines of fruit growing all over California than a year ago."

Walnuts and almonds and most varieties of peaches had already been pretty well cleaned out of the Armstrong Nurseries when visited Feb. 7. A good demand had come for pears, mostly from the Victorville and Antelope Valley districts. Apples and apricots had been moving only fairly well. A big call had come by wire and mail from the San Joaquin Valley for Calimyrna figs, which could not be supplied. There was a big run on Thompson grapes for the San Joaquin and inland parts

of Southern California.

Though the citrus planting season was nearly a month off, first-class trees were becoming scarce, according to Mr. Armstrong. He also noted interest in the early ripening Ascolano and Manzanillo olives on account of frost danger to later varieties in many districts. The large varieties for ripe pickles are already a reality as evidenced by the success of C. C. Graber in processing them in first-class shape.

Quite an interest is developing in avocados for commercial planting, but Mr. Armstrong would advise only the hardy varieties for valley planting where there is any danger of freezing. At least a dozen commercial varieties are showing up very well. The demand for each variety seems to be sectional, one in each district seeming to have a distinct lead in favor.

New Zealand Fruit Growers.

New Zealand has a world-reputation for making great ideas work by law. The government has enacted a law placing an annual tax of about 25 cents an acre on all fruit plantations. This money is turned over to the New Zealand Fruit Growers' Federation, Ltd., which represents all the fruit-growing associations in New Zealand.

It is estimated that the tax will produce, to commence with, some \$15,000. The principal work at the outset is to urge growers who are not already members to join an association and affiliate with the Federation. It is only by such affiliation that any fruit-grower can derive any benefit from the tax which he is compelled to pay. There are now three co-operative packing and selling companies in existence and the erec-

tion of a cold storage plant has been begun, for which the government has advanced the capital.

In order to educate the people up to the value of a fruit diet, it has been decided by the Federation to inaugurate an advertising campaign. It is also proposed to send a representative to investigate the markets of the Eastern States of America, and probably India and the Straits Settlements. The cost of this is to be borne by the tax money raised by the government.

ETTERSBURG STRAW-BERRIES.

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

SCHOOL PRINCIPAL MAY DRAW TWO SALARIES.

To the Editor: Please advise me if it is lawful or unlawful for one school principal to draw two salaries, one from the State as high school and the other from the county as grammar school. Both schools are separated by one block. The other principal is teaching eighth grade. This one is held as assistant. The two assistants that held the position the last four years showed that they were qualified enough to teach high school themselves, for they hold that position now.

The principal that draws two salaries has a contract with the grammar school trustees for three years at a time, and is paid about \$1200 per year. He gets about \$300 per month including the high school. This school has five trustees, not including the grammar school trustees. There are nine teachers in the grammar school, including the cooking teacher. These get only medium wages.—J. A. C., Newman.

[Answered by Edward Hyatt, Supt. Public Instruction, State of Cal. Sacramento.]

Relative to the principal of a high school acting as principal of a grammar school, permit me to state that under the law the board of school trustees of a grammar school district in which a high school is located may select the principal of the high school as the principal of the grammar school. Such board has the power of fixing the salary to be paid such principal—taking into consideration his salary as principal of the high school.

This is the common custom in many districts. Some of the cities even pay part of the salary of the teacher or principal out of high school money and part of it out of grammar school money, the amount paid from each fund depending upon the amount of work done for each school.

SAVED TWO IRRIGATIONS OF MILO.

[Written for Pacific Rural Press.]

That there would be seven weeks of water shortage after planting his milo last year was known to S. G. Haskell of Imperial Valley; and he prepared for it. The result was about 76 tons of threshed corn from 45 acres. A piece next to his and on the same kind of ground produced not over half a ton per acre, but lots of weeds.

The ground was plowed about six inches deep the last of June and flooded. The water was turned off as soon as it had gotten across the checks. A smoother was run over it for a dust mulch. It was disked with the disk lapping half each time and going three inches deep. Then it was smoothed again. Three teams were used at once and the ground was planted and harrowed both ways right after the smoothing. This put the seed in finely cultivated moist earth under a fine dust mulch. It was never cultivated again; but it grew to three feet in height before the first irrigation, and never wilted. Generally about four irrigations are given, according to Mr. Haskell, but this milo got only one more when it was headed and starting to fill. The fine seed bed not only made the good crop but saved the cost of two irrigations.

The water was applied by flooding, 150 miner's inches covering about 30 acres in a day.

790 Bushels of Potatoes

PER ACRE, THE LARGEST CROP ON RECORD IN THE U. S.

Were grown in California and awarded Grand Prize by International Jury, P. P. I. E. Not only was this the largest crop, but the quality was especially fine, bringing a price considerably above the market. The grower attributed a good part of his success to the use of

Gold Bear Fertilizer

The average crop of California is about 150 bushels. What do you get?

W. V. Shear, Potato Expert, says: "Don't try to save money by adopting cheap methods to cut from cost of production. Is it not

good business practice to spend enough money to produce a good crop and make money on the investment rather than use cheap methods and lose money?"

Fertilizing is not an expense, but an investment, yielding immediate returns.

Let us help you solve the problem of bigger and better crops.

Winter Growing Alfalfa.

Many dairymen are short of feed now, while a few have thrifty fields of winter-grown Peruvian alfalfa, which is being pastured to good advantage in Imperial Valley.

A winter-growing forage crop would just now be almost a cow-saver for the many dairymen of Imperial valley whose feed played out about January, largely because of the water shortage last year. One of the leading dairymen grew a crop for silage; but it didn't fill the silo; and late in January he was buying \$20 alfalfa from one of the very few so fortunately situated in this Valley of Alfalfa as to have some to sell this season.

Due to the scant winter rainfall here, there are seldom more than two or three weeks in a year when alfalfa fields are too soft to pasture, except after irrigations. Since the common alfalfa generally grows very little through the winter, it cannot solve the problem.

But there is an alfalfa, the Peruvian, which does grow even in the present winter, which one of the pioneers of the Valley declares has been the most continuously cold that he has experienced.

Two kinds of Peruvian alfalfa are recognized, though it often makes an expert guess a little to tell one from the other when shown a single stalk.

Many fields of the so-called smooth Peruvian have been visited by the writer the past January; and the growth has been uniformly better than any except one or two very special fields of the common Chilean.

Very little of the "hairy" Peruvian has been grown long enough to make a test. Sixty acres of this variety were planted by C. C. Bowles two years ago.

Not a very good stand was obtained, partly because it was sown for seed and intended to be thin, and partly because the land had been used for ostrich pasture and the birds had puddled the "hard" soil by constant travel, worse than cattle would have done it. Part of this, last fall, was cut for seed, winrowed at once, and stacked for threshing. Part was not mowed because rainy weather came before the press of other work permitted. Here, the field is brown with the ripened tips and seed pods near knee-high; and the young growth of the winter is almost as tall amongst it. On the part where the poorest stand was obtained, everything was mowed about New Year's, and the seed left on the ground to get a better stand. Here the new growth is about eight inches

tall as a general average this January 30.

Across the fence are a few checks of smooth Peruvian in which many bunches of hairy Peruvian stand out distinctly as seen at a distance, not only by their much greater growth, but also by the silvery sheen presented by the sunlight on the fuzzy white coats of the leaves and upper parts of stems. Examined closer, the stems are seen to be clothed almost like an overcoat with the many-leaved laterals which have grown from every joint except the lowest one.

The leaves are more slender than the smooth Peruvian, which looks like a good cross between the hairy Peruvian and the common variety. On the hairy variety, they seem to have a tendency to fold their upper surfaces together, in cold weather at least, thus exposing the hairy under surfaces to the weather. The furry coat extends downward for several joints, but the older parts of stems and the lower leaves do not seem to be hairy.

This fuzz, according to Mr. Bowles, is a great protection for the exposed stems and leaves against frost. The moisture gathers and freezes on it without injurious contact with the stems except in severe weather such as has visited Imperial Valley the past winter.

In these tall clumps of the hairy variety among the smooth, we saw some in which stalks had been frosted especially on top; and some where side stalks unprotected had been killed down. But the smooth variety alongside had been much worse frosted.

This field, Mr. Bowles said, had been pastured close by Roy Benton's cattle until November 1. We found plenty of clumps in which the stalks were 20 inches long, and one stalk which was 28 inches long. The common Chilean, from which the cattle had been removed before taking them from the Peruvian, was scarcely shoetop deep.

The practice is to pasture the Peruvian in winter, make the first cutting in March or April into hay, let it go to seed in about 90 days, cut it about July 1, let it go to seed again, cutting about Oct. 1, and pasturing again. The winter pasture, says Mr. Bowles, brings about \$2.50 per head per acre per month in winter, but only half that much in summer, adding to the desirability of a winter-growing forage. The threshed hay is said to be worth about \$12.50 per ton. Ordinary hay is selling at \$20 on the ranch.

Besides the fields of smooth Peruvian and common Chilean, Mr. Bowles planted 140 acres of hairy Peruvian about Dec. 1, 1916. This had only a few leaves when cold weather came, but stood it in fine shape, according to Mr. Bowles. The writer did not see it. All of the common alfalfa is to be plowed up, planted to corn or cotton, and sown in the fall to hairy Peruvian.

The Butte County Spring Festival is to be held May 21 to 26 at Chico.

Proposal to Define "Commission Merchants"

Following is the full text of a measure introduced by Senator Duncan in the State Senate on January 15, 1917, for the purpose of establishing more exactly the status and liabilities of persons, firms, etc., purporting to carry on the business of "commission merchants." It was referred to the Committee on Agriculture:

AN ACT

Defining commission merchants and consignors: providing for filing of bond and certificates showing names of persons doing business or advertising as commission merchants, and providing penalties for the violation of the requirements herein contained.

The people of the State of California do enact as follows:

Section 1. The term "commission merchant" as used herein shall be deemed to include any person, firm, corporation, partnership, association or copartnership doing, transacting, or carrying on, or advertising either by means of printing or writing through newspapers, cards, circulars, or letter head as carrying on, the business of commission merchant, as that term is generally understood, or as selling or receiving for the purpose of sale, produce, goods, or other personal property on commission, or by which he receives any part of the proceeds of the sale of the property. The term consignor includes any person, firm, partnership, corporation, or association, shipping or forwarding produce, foods, or other property to a commission merchant to be sold by the latter on commission, or under an agreement expressed or implied, by which the latter is to retain a portion of the proceeds of the property sold.

Sec. 2. No commission merchant shall receive, sell, or attempt to sell on consignment or commission, or in any manner in which he retains any portion of the money for which any personal property is sold, any produce, merchandise or other personal property unless said commission merchant shall first file with the Secretary of State a statement showing in detail whether said commission merchant is a private individual, corporation, partnership, or association, and if a corporation, the amount of capital stock, the amount actually subscribed, amount actually paid in, the names and residence of each of the stockholders, together with the amount of stock held by each, the principal place of business of said corporation, and if a partnership or association, the names and residence of each person composing the same, together with the interest or share which each person holds in said partnership or association, or if the said commission merchant be but one person, then the name and residence of such person shall be set forth in full, but in each instance the name under which such commission merchant transacts business shall be set forth in said certificate. Said certificate in each instance shall be verified by the oath of each person having an interest in the business of said commission merchant; provided, that in the case of a corporation such certificate may be verified by the oaths of the president or vice president and secretary of such corporation, but in such case, such statement must show the names and address of each holder of the capital stock in such corporation as shown by the books thereof. Said certificate shall be accompanied by a bond to be approved by the Secretary of State in the sum of five thousand dollars payable to the people of the State of California, conditioned that said commission merchant will conduct his business strictly in accordance with the terms of this act, and well and truly account for and promptly pay to any and all persons consigning produce or other personal property to such commission merchant, the proceeds of the sale of such produce or personal property less his commissions thereon. Any person suffering loss or damage through the acts or omissions of said commission merchant may recover upon said bond the amount of damage sustained by him.

Sec. 3. Any commission merchant violating any of the provisions of this act shall be deemed to be guilty of a misdemeanor and upon the conviction thereof shall be punished by a fine of not less than fifty dollars nor more than three hundred dollars, or by imprisonment in the county jail for not exceeding six months, or by both such fine and imprisonment; provided, that nothing herein shall be deemed to prevent or bar the prosecution of any commission merchant or other person for embezzlement or for any other felony or misdemeanor.

A GREAT BIRD FARM.

Under the will of the late Lord Lucas, land and premises in Norfolk, England, have been bequeathed to the Honorable Ivor Grenfell. This property, of 3000 acres, was acquired ten years ago by Lord Lucas, Viscount Grey, Honorable E. S. Montague and B. Russell, all keenly interested in bird life, in order to provide protection for rarer kinds of birds. Elaborate precautions have been taken to preserve from disturbance some young birds of a very rare species, and careful study is made of the habits of the colony of birds on the estate by the head keeper and others in the employ of these bird lovers.

THE QUAIL A SONG BIRD.

By an almost unanimous vote the Ohio House of Representatives has passed a bill to put quail on the song bird list and prevent hunters from killing them. The measure now goes to the Senate. Under existing laws quail may not be killed until 1920.

Cotton growing is to be tried in Butte county.

FARM VALUES AND RAILROADS

Transportation Problem Must be
Solved Nationally in Order to
Assure Agricultural Prosperity.

THE greatest industry of the United States is farming. Next to that comes transportation.

Efficient transportation is essential to the continued welfare and business progress of the nation. To the farmer it means wider markets and better prices for his crops.

Speaking for 90 per cent of the railroad mileage of the country we invite your co-operation in the solution of the railroad problem to that end.

Make Regulation Efficient

There is no question that public regulation of transportation has come to stay. The railroads accept it. They ask only that such regulation be made efficient. They ask that the functions properly subject to public supervision—incorporation, the issuance of securities, the making of rates—be placed under the direction of a single responsible national body such as the Interstate Commerce Commission, with regional sub-commissions, in order that regulation may be kept close to the people. They ask that such regulation be so administered as to permit the railroads to earn a living return, to attract new capital and to make the improvements and extensions necessary to enable them to serve the American people fairly and efficiently.

In the Federal Reserve and Rural Credit Banking Systems the operation of regional divisions under Federal supervision is well illustrated. The railroads seek a similar solution of their problem.

Commerce Is Nation Wide

The farmer wants free trade among the States.

Commerce in farm products is not confined to State lines. It is nation wide. Its regulation should also be national. The fundamental State right is the right of each State to be protected against discriminations by other States such as exist today. Every barrier that a State erects to the free movement of commerce across its borders limits the farmer's market, makes it easier for speculators to control products and depress prices, and tends to increase the cost of what the farmer has to buy.

The railroads cannot serve 49 masters—48 States and the Nation—and serve efficiently. The present system of multiple and conflicting regulation is wasteful and destructive.

In the interest of all, regulation should be in behalf of all the States. We invite discussion of this question and shall be glad to answer questions and to supply information on request.

This is the first of several brief talks on this subject.

Questions on Compensation Insurance.

[Written for Pacific Rural Press by A. J. Pillsbury, Chairman Industrial Accident Commission.]

In my answer to W. T. J. Shawmut, published in your issue of January 13th, I made an error in stating that insurance against the risk of compensation was figured on the wage of farm labor exclusive of board. This was so originally, but the rate-making powers afterwards changed the rule and now almost uniformly add \$16.00 per month to the monthly wage for board and lodging in order to get at the real value paid for the services rendered. I regret this error, but had not been informed of the change in the rule.

Minimum Premiums Charged.—No matter how small the policy it is necessary to have the payroll verified, and there is a certain minimum cost for putting a policy through the entire process from the application for it until the policy is issued, the premium collected, the payroll audited, and the final account squared at the end of the year. This minimum, so far as the Compensation Insurance Fund is concerned, is \$6.00. Some of the other insurance carriers charge \$10.00. If the premium at \$1.50 per hundred of payroll would amount to \$6.00 or more, then this minimum is not considered at all, but if the premium on the payroll amounts to less than \$6.00 then \$6.00 will be charged for the policy. That is, no policy will be sold for less than \$6.00, but the \$6.00 will not be an additional charge if the premium for the year would amount to more than \$6.00.

It is not necessary, when a policy is taken out, for a farmer to know just how much help he is going to hire for the coming year. With his application for a policy he will file a statement of the anticipated payroll and will pay for the policy on the basis of what he anticipates that he will hire during the year, but at the end of the year, when he foots up his total wage payments and certifies the same to the insurance carrier, the account will be adjusted to this final report as audited by the payroll auditor. If he has employed less help than he estimated, the excess premium will be returned to him. If he has employed more help than he anticipated he will pay the difference between what he did pay when he got his policy and what he should pay on the total payroll.

Premiums Based on Payroll.—We are asked by another subscriber how it will be with a man who employs help occasionally; perhaps some in haying time and some in the fruit season and some in the harvest, and during the rest of the time one does his own work. This makes no difference. All he has to do is to keep a careful account of the help that he does employ during the year and account for it to the insurance carrier

at the end of the year. The only help he hires at all during the year may be within a period of two or three weeks, but, as stated in my former article, whether a farmer hires one man for twelve months or twelve men for one month makes no difference; he will pay so much on the hundred of payroll for insurance protection. So, if a farmer needs somebody for a few days he simply adds the amount paid out for this extra help to his payroll record and is covered by his insurance.

Just here I wish to call the attention of farmers to the fact that they may, if they wish, insure themselves and the members of their own families, together with other hired help, and in Bavaria at least 75 per cent of all the claims paid for injury to persons engaged in agriculture are paid to the farmers themselves or members of their families, but if the farmer intends to insure himself or a member of his family he must so notify the insurance carrier at the time that he makes his application for insurance and must state the wage value which he places upon each such person he desires to have insured. Of course this wage estimate should be in accordance with what he himself or the working members of his family would probably be able to earn if they were seeking employment in an open labor market. I believe this to be a prudent thing to do, for, taking the State at large, there are probably as many farmers as farm laborers injured if we include the working members of the farmer's family; but remember that such members of the family, and the farmer himself, can scarcely be included if an accident happens unless the insurance carrier was informed of all the facts when the insurance policy was sold, although it has sometimes been possible to prove that members of the family were working for wages and compensation has been allowed in such cases. A case testing this issue is now before the Supreme Court, and the only safe way is to state fully in the application for insurance just what members of the family it is proposed to have covered.

WILL SQUIRRELS EAT TOMATOES?

To the Editor: Will ground squirrels attack tomatoes? I wish to plant tomatoes on very good sandy loam along a creek adjoining pasture land, where ground squirrels are plentiful in spite of governmental inspection, and they come down after green feed gives out and may get at my tomatoes. Two years ago they almost ruined a good crop of potatoes in the same place.—J. C. W., Concord.

[This passes our observation. Will some reader kindly answer?—Eds.]

UPLAND RICE IN THE SOUTH.

To the Editor: Referring to an inquiry in the Rural Press of January 20, would say, in the line of information sought, that an upland variety of rice is well known in the South. I have seen it growing on high, sandy land with a clay subsoil of one and one-half to three feet deep, without irrigation. Experimenting would be necessary here, as the climate is less humid. The J. Steckler Seed Co., New Orleans, has the seed and would send catalog containing directions for planting.

San Francisco.

G. C. A.

A Pennsylvania Farmer Says Concerning Electric Motors on His Farm

"A one-horse power motor is located in the spring house for separating milk, churning butter, turning a grinding stone, etc.

"In the house, my wife has a 1/6-horse power motor for running a washing machine. This motor can be attached to any lamp socket.

"In the barn a 15-horse power motor mounted on a little truck may be moved to any part of the barn or barnyard for grinding feed, baling hay and threshing grain. By extending the cable we have used this motor 400 feet from the barn."

This letter suggests equally profitable installations around your house and barns. The General Electric Company manufactures all sizes of electric motors for farm use. Information will be gladly furnished by your lighting company or our nearest motor agency.

Spring Harrowing is Drought Protection.

[Written for Pacific Rural Press by G. W. Hendry, Instructor in Agronomy, University Farm.]

It is possible that California may experience another dry spring. Already the seasonal rainfall for Northern California is from 4 to 11 inches below normal and the prospect for a good grain crop is becoming more dubious each day. Grain seeded in December and January is in good condition at this time and is not yet suffering, but the moisture in the ground is so limited that unless spring rains come to its assistance the crop will certainly suffer for water in May and June. February-planted grain will be even more dependent upon spring rain and will require considerably more of it.

Harrowing the Grain Field.—The conservation of the present limited supply of ground moisture is the next best thing to having spring rains. Harrowing of young grain at this season of the year will result in breaking the crust between the plants, and holding in the ground for the use of the crop soil moisture equivalent to two or more inches of rainfall. This should be done while the soil is sufficiently moist to pulverize well. If delayed until the soil becomes hard and dry to a depth of several inches, a good surface mulch can not be established, and the work would result in much damage to the crop. The success of the operation depends upon doing it when the soil is in condition to work. If rain comes after harrowing it will be necessary to repeat the work. Drilled grain stands harrowing better than broadcasted grain, but the harrowing should be done at right angles to the direction of drilling. Harrowing is more effective on level, well-prepared ground than on rough, cloddy land.

When to Harrow.—Very young grain, especially if sown broadcast, may be damaged by harrowing, also grain which has started to joint or shoot should not be harrowed. Very little damage, however, will result if the work is done while the plants are in the rosette stage.

How to Harrow.—The ordinary wooden frame spike-tooth harrow does the work well, but if the plants are very young a lighter harrow with the teeth slanted backwards may be better. The corrugated roller is recommended for very young stands and may give good results if the soil is mellow enough to pulverize easily, but would be less effective on hard dry ground. The object of the work is to mulch the surface soil, and any means of accomplishing this without damaging the plants is approved.

Practice and Poetry.—Spring harrowing of grain has been successfully practiced on the University Farm at Davis, where it is believed that the operation is a good one for dry seasons, and results in holding in the ground for the use of the crop moisture which would otherwise escape into the atmosphere and be lost. To clearly illustrate this principle we must relate the true fable of the California farmer whose land was crossed by the railway, and who during a dry spring, fearing for the safety of his grain, decided to harrow out a twenty-foot strip of his field adjacent to the right of way as

a precaution against fire. This he did in the spring while the grain was still young, traversing the ground many times with his harrow, and returned home rejoicing that he had succeeded in protecting his crop by the destruction of this twenty-foot strip of grain.

But returning to his field in June for harvest he was astonished beyond measure to find that the twenty-foot

fire line which he had expected to find fallow had produced an abundant crop of grain, yielding far in excess of the rest of the field. And as he gazed thoughtfully upon the result of his work he was heard to say:

During seasons of scant rain
We should harrow our grain.

Because of a disagreement as to dates the County Fair Ass'n of California has broken up. This will result, it is said, in the forming of a northern and a southern fair association.

IRON AGE

GARDEN TOOLS

Answer the gardener's big questions:
How can I grow plenty of fresh vegetables with my limited time?
How can I avoid backache and drudgery? Use

IRON AGE Wheel Hoes and Drills

Do the work ten times faster than the old-fashioned tools. A woman, boy or girl can push one. 38 combinations—easily adjusted. Light, strong and durable. Prices, \$3.25 to \$16.00. Will help you to cut the high cost of living.

There Are Dollars In Your Subsoil. Get Them Out!

The value of your land can be greatly increased by means of subsoiling. Beneath the surface soil of your fields, which has been thoroughly stirred by your plow and kept fertile by the rotation of crops, there lies a subsoil that you have never touched.

This subsoil is probably either one of two things—rich soil of which you should be getting the benefit, or a hardpan which is obstructing drainage, deforming the roots of plants and trees, and in other ways lessening the value of your land. In either case it should be broken up by means of

HERCULES DYNAMITE

If the underlying soil is fertile and rich so much the better. Subsoiling with Hercules Dynamite will stir it up, bring part of it to the surface where it will be at the disposal of your crops, loosen it so that the roots can penetrate it easily and get out of it all the good there is in it.

On the other hand, if the subsoil be a hard, impervious layer beneath the cultivated soil it is imperative that it be broken up in order to facilitate drainage, give roots a chance to spread naturally, and get out of it the mineral food it contains.

By means of subsoiling the yield of thousands of acres

in this country has been increased anywhere from 10% to 200%, depending on the crop and local conditions. Soil that has been utterly unproductive has been made fertile.

If you have not looked into this question you should. As a first step write for our book, "Progressive Cultivation." It will be sent free on request. It not only discusses in detail the matter of subsoiling with dynamite but also tree planting, irrigation, drainage work, rock and stump blasting, etc.

You will find it worth reading. Send for your copy today. Please use the coupon below.

GRAINS AND FIELD CROPS.

February alfalfa irrigation was indulged in on the Orland project this year.

An unusual acreage of potatoes is being planted in Fresno county this spring.

Heavy plantings of asparagus are being made on the river islands near Rio Vista.

W. A. Collins of Brawley expects to ship asparagus to Chicago this month.

Imperial Valley people are getting ground ready for much more cotton than last year.

One Louisiana rice milling company used 254 carloads of California rice and did not reject any.

Rice straw will be used for bedding at the Butte County Fair this year. About 40 tons will be required.

Ventura Lima bean growers have voted in favor of including small-bean growers in the State Association.

It is reported that a Stanislaus county shipper has disposed of 200,000 pounds of Mexican beans to a Wisconsin firm.

Two large vegetable and fruit packing plants are to begin operations this season at San Leandro, Alameda county.

Though rice requires more water than any other commercial crop, Imperial Valley has a 240-acre field of the Italian variety this season.

Only the high cost of seed will stand in the way of very heavy potato planting this spring. At any rate a large acreage will be planted.

Lindsey Bros. of Ripon are putting in 50 acres of American Wonder potatoes to raise for certified seed under the State Seed Potato Law.

Siam rice prices have been advanced by importers due to increased ocean freight rates. This ought to give a better tone to the California rice market.

A carload of fancy potatoes was recently shipped to Louisiana from Carmel Valley, Monterey county. Each sack was bedded in straw, so the report goes.

L. C. Johnson of Pomona expects to profit highly by the frost which killed the early cabbage crop in Florida. He has 500,000 thrifty cabbage plants growing in field.

Reports from Oxnard say that sugar beet planting is being pushed rapidly in that section and the acreage will be the largest ever planted. About 10,000 acres have been planted so far.

Only about 1,000 bales of cotton on the American side and 4,000 on the Mexican side of Imperial Valley remained to be ginned Feb. 14. The winter has been exceptionally favorable for picking and for good quality staple.

The grain acreage in Yolo and Colusa counties is easily 50 per cent greater than to the same time last year, due to the long dry period permitting field work, writes our representative in that district.

The California Lima Bean Growers' Ass'n contract for 1917 provides that the grower and not the Ass'n is to be responsible to the buyer, and that two cents per pound for all uncleaned beans and seed not delivered by members shall be paid to the Ass'n.

Grain reports from our field representatives: $\frac{3}{4}$ barley crop in ground in Stanislaus, general depression on account of dry weather, farmers well caught up with work; lots of grain sowed in Fresno county awaiting the rain which has come; large acreage of barley planted in Brawley district of Imperial county.

Two hundred and fifty acres of peas have been planted by Lindsey Bros. of Stanislaus county and con-

tracted to the Pacific Pea Packing Co. to be delivered by truck to Oakdale. Two 250-ton silos are to be constructed on the ranch for the vines. Beans will follow the peas and potatoes, all being watered by subirrigation.

The Turlock cannery has contracted for 800 tons of tomatoes and is offering to sign five- to ten-year contracts for more. They also want asparagus. It is hoped that the cannery may be operated eight or ten months per year instead of two or three as heretofore. Workers' houses are being built and grounds beautified.

T. P. Daly, manager of the Cudahy ranch at Hechicera, Mexico, who was in Los Angeles last week, says every acre of the ranch will be planted to cotton this year. "We had in 2,000 acres in cotton last year and have been clearing the land as fast as possible since the last crop was harvested so as to increase the acreage to cotton this year," he said.

DECIDUOUS FRUITS.

Sugar prunes are being planted in the Gilroy district where French prune nursery stock is reported scarce.

Pajaro Valley dried apples brought more money last year than since 1913. Prices were up to 7 $\frac{1}{4}$ cents per pound at one time.

At the annual meeting of the Sebastopol Berry Growers Inc., held last week, it was stated that the gross business of the year amounted to \$315,000 and that the profits were approximately \$5,600. The old board of directors was elected.

About 9000 tons of the 1916 dried peach crop has been disposed of by the Cal. Peach Growers, Inc., and the remaining 14,000 tons are expected to go before next crop comes in. This will be a great step; for the holdover has held prices down year after year.

The organization of the fruit growers of the central valley counties into the Valley Fruit Growers' Ass'n was perfected at a mass meeting of over 800 growers in Fresno recently. Its object is principally to have a hand in legislative matters or other problems of a general nature.

The United States leads the world in the export of fruit, according to statistics just published in U. S. Dept. Agr. Bul. 483. The fruit exports from this country were valued at \$18,505,000 in 1910 and \$34,230,000 in 1915. Fresh and dried apples comprised one-third of the value of these exports.

The first step in the advertising campaign of the Cal. Peach Growers, Inc., was taken last week by the mailing of 5,000 letters to growers suggesting that they send a five-pound carton of peeled peaches to friends outside of the State. The association agrees to take care of all such orders on receipt of \$1 or will charge the dollar to the member's account.

J. B. Inderrieden, head of one of the large importing and fruit-packing companies of Chicago, says the importing of dried fruit from abroad is going to be the smallest in the history of the trade next fall. This should be good news to California, as we produce the bulk of dried fruit used in this country and with any kind of a crop California fruit men should reap a big profit.

CITRUS, NUTS, SEMI-TROPICAL.

Contra Costa almond orchards are abloom.

A 20-acre grove near Upland sold for \$40,000 recently.

Figs and almonds are the favorites in Merced orchard planting this season.

DEPT. 3,
PIONEER NURSERY, Monrovia, Cal.

cars of oranges had been shipped up to Feb. 12.

One ship took a complete cargo of 2,500 tons of figs from Portugal to New York last season.

Florida orange shipments are about past. It is said that over 10,000 carloads of their oranges were frosted. Probably this is exaggerated.

Several hundred acres will be planted to figs this spring on the Bullard tract near Fresno. Teams and men are now leveling the land and digging and blasting holes.

The Gillette Ranch of Tulare county shipped 10½ cars of citrus fruit after the freezes this year, most of it under the Sunkist brand. Very few frozen fruits were found.

Reports from Pomona say that land transactions in that section have shown more life the past sixty days than any time since 1912. Cash sales of citrus groves are not of infrequent occurrence.

The Cal. Walnut Growers' Ass'n handled 5 per cent more of the crop in 1916 than in 1915, and sold them for \$376,295 more than ever before, in spite of 36,800,000 pounds of walnuts imported to U. S. last year.

Citrus fruit shipments from Riverside are reported to be small, only 28 cars having been sent out for the week ending January 20. Despite this fact the season's shipments are nearly 200 cars ahead of last year's shipments at the same time.

H. A. Spies, Deputy Horticultural Commissioner of the Upland district, is urging orange growers to disinfect their picking bags and other equipment as the best means of eradicating the mealy bug that has got such a foothold in that section.

At a meeting of the stockholders of the Santa Ana Valley Walnut Growers' Association last week it was decided that in the future the Association would market their culls through the California Walnut Growers' Association. They have heretofore been sold independently.

A grocer of Pasadena, after endorsing Imperial Valley dates, wrote to I. B. Suryich of the Imperial Valley Experiment Farm saying he would like to get in touch with a good grower, as he has established a good Eastern outlet for California dates, and at the right price could market almost any quantity.

The Orange County Fruit Growers' Exchange is supporting an organization for co-operative fumigation. The 2000 acres required, had been signed up according to Horticultural Commissioner Roy K. Bishop, previous to a meeting February 9, when the committee was directed to draw up the articles of association.

Citrus spraying with lime-sulphur 1 to 20 for winter use against red spider, does no injury according to Orange County Horticultural Commissioner Roy K. Bishop, if there is no new growth and if very warm weather does not follow within two or three days. When used, it is recommended that the trunks and main limbs also be sprayed to clean off moss, etc.

The citrus growers' meeting at the National Orange Show, San Bernardino, Feb. 23, will be addressed by Dr. H. J. Webber of the Citrus Experiment Station, Riverside, W. H. Fleet of the Sespe Rancho, Ventura county; J. P. Englehart, Glendora; Prof. R. S. Vaile of Riverside; F. O. Popenoe of Altadena, and Dr. Elwood Mead of the University of California Agricultural College, Berkeley.

GRAPES.

The 1916 Board of Directors of the Cal. Associated Raisin Co. was re-elected for 1917.

The American Vineyard Co. of San Francisco plans to plant as much as possible of 1150 acres in Merced county to Thompson Seedless grapes.

Japanese tenants have secured a large part of the Tokay grape vineyards in the Lodi district for the coming year. Price last season ran as high as \$150 an acre on the vine.

The Greek currant harvest of last

season was about 100,000 tons dried. The normal crop is about 150,000 tons. The quality was good, due to good harvest weather.

STATE TO BE DISTRICTED FOR FAIRS.

For the purpose of holding fairs, expositions, etc., of all the industries within each district, a bill has been introduced in the Legislature by Senator Slater to divide the State into 15 agricultural districts. District fair organizations to have the usual form are provided for. "Any sum appropriated by the State for aid to the district agricultural associations herein provided for . . . shall be used exclusively for the payment of premiums upon bona fide exhibits of agricultural, horticultural, viticultural and mechanical products, or of manufactures, or

mining or forestry products, and for the payment of premiums upon exhibits of domestic live stock, except" what is necessary up to 20 per cent of the appropriation to pay salaries and office expenses.

IS YOUR SOIL 100 PER CENT EFFICIENT?

Few Ranchers Realize Full Possibilities of Their Land.

It is an astonishing fact that the great majority of California ranchers and fruit growers are suffering a very serious loss every year, of which they have little or no knowledge. That is, their crops do not begin to measure up to the maximum possibilities of their lands. This is a condition which would not be tolerated in any other line of business, and there is no good reason why it should be endured in farming—the greatest business in the world.

If you do not get a full crop from your fruit orchard, your alfalfa land or grain field, it is probable that the principal fault is in the soil itself.

It is impossible to tell from the looks of a soil whether it is in perfect condition, and soil experts are, of course, expensive.

Every rancher will learn with interest, therefore, that a little device has been perfected which will test soil accurately, and show just what it needed to bring it up to the maximum of bearing efficiency. The initial cost of this little machine is very nominal, considering its great value to the rancher in increased crops. Once the device is obtained, the cost of each soil test is only a few cents.

These soil testers are being distributed on the Pacific Coast by Mr. Clement B. Stern, 613 Central Mortgage Bldg., San Diego, California, who will be glad to mail literature and full information regarding them to any reader of this paper who will simply drop him a line.

What Are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

PACIFIC AUTOMOBILE SHOW.

[Written for Pacific Rural Press.]

Farmers have been the biggest buyers of automobiles during the past two years, according to Alfred Reeves, general manager of the National Automobile Chamber of Commerce, which delegated him to open the First Annual Pacific Automobile Show, which was held in San Francisco Feb. 10 to 18. In 1916, by figures of the N. A. C. C., 1,525,578 automobiles, valued at \$921,378,000, and 92,130 auto trucks, valued at \$166,650,273, were produced, the biggest year of the industry. The average retail price per automobile was about \$604, and per auto truck was about \$1812. This shows that low-priced automobiles have been most popular.

The Pacific Automobile Show, though held under the auspices of the local Motor Car Dealers' Ass'n, is expected to become the scene of the Third National Automobile Show, for such a recommendation was promised by Mr. Reeves; and the other Pacific Coast cities are aiding the move. The attendance is estimated at a total over 60,000.

Over 200 machines of 44 makes, ranging from a value of \$12,500 down to \$360, and from 12 cylinders down to four, were exhibited on the main floor of the Exposition Auditorium. Upstairs were 42 accessories exhibits. It was here that the visitor looking for new things found most to interest him.

Among the automobile exhibits, one of the noticeable features is the changing of angles and abrupt curves in hood and body lines, to long full-flowing curves giving a fine impression of great power and beauty.

Shaded lights held aloft by figures of Mercury were marked with names of cars in their vicinity, so the visitor could easily locate the one he wanted. The whole auditorium was lighted and decorated at a cost said to be \$35,000, to a state of luxurious attraction that interested many of the women more than the machines did. Not so with all, however, for it was noted that the number of women who drive for health, pleasure, or business has been increasing perhaps faster than the production of automobiles. And the attention of exhibitors was paid to women as carefully as to men. For the same reason, most of the improvements noted in cars were in the way of new comforts, conveniences, and adornment.

Among the features noted was the \$25,000 golden Studebaker chassis. An Overland, set on a revolving platform and surrounded by flowering plants, attracted attention. The Knight motors used in Willys-Overland machines, with their sleeve valves operated by a cam shaft, were shown in slow operation. A Hudson bearing the legend "World's Record Run San Francisco to New York 5 days 3 hours; New York to San Francisco 5 days 17 hours" called attention to their Super-sixes, which are about the same now as when introduced a year ago, in spite of the wide discussion of the principle on which their crankshaft is built. Six or eight Chalmers of two to seven passengers were shown in practically the same models as a year ago, except for larger brakes and little improvements here and there. Four Mitchells of powerful suggestion and enlarged radiators featured their eight-cylinder models adopted last fall. A cutaway Cadillac chassis in slow motion attracted the visitor to the large display by Don Lee. The magnetic gear shift of the Premier, operated by buttons, makes it as easy to handle as an electric machine. The 12-cylinder 1917 Haynes was the first of its kind on the Coast. A Dort chassis was illuminated with 800 lamps. The Death Valley Dodge motion picture hall was usually crowded. The new 8-cylinder Kings were shown here for the first time.

The first sale at the Show was a Saxon, within an hour after opening. The Hudson people posted a list of 16 sales made in the first seven days. Other dealers reported satisfactory business and the enrollment of many prospects.

Accessories.—Of the accessories we can only mention the most striking at this time: A self-repairing inner tube with two layers of fabric almost all around and quadrupled thickness of rubber where blowouts might occur; three or four types of pneumatic shock absorbers which seem to work best with the stiffest springs, perhaps presaging the elimination of springs, several makes of tires and bearings, a solid rubber tire to be put on over a pneumatic tire, several speedometers, light controllers, carburetion devices, tools, etc. The California Automobile Association and the State Motor Department had booths and exhibits to illustrate their methods and activities.

TRACTOR ASSOCIATION ORGANIZED.

On Saturday, Feb. 17, representatives of all the big tractor manufacturing companies on the Pacific Coast and California representatives of most of the Eastern tractor manufacturers met at the Palace Hotel in San Francisco and organized the California Tractor and Implement Association. H. A. Smith, of the Joshua Hendy Iron Works, was elected president of this organization; W. H. Gardner, of the Yuba Construction Company, vice-president; and G. M. Walker, of The Holt Mfg. Co., secretary and treasurer. The chief pur-

Southern California and throughout the Middle West. Membership in the Association is open to tractor manufacturers, manufacturers of plows, harrows, scrapers, and other implements to be used with tractors, and representatives or jobbers of the above-named classes of concerns.

The next meeting of this Association is to be held the last Saturday in March, at which time definite steps will undoubtedly be taken towards the making of arrangements for the biggest tractor demonstration ever held west of the Rockies.

EARLY DISKING BY TRACTOR PREVENTS BAKED SOIL.

[Written for Pacific Rural Press.]

There is a citrus district in Tulare county where the ground works fine if worked in time after winter rains or irrigation; but a little delay lets it crust hard, and soon it bakes so deep that it can scarcely be worked down all summer. Last year an acre out of the 60 acres of citrus and olive orchard worked by F. B. Alexander had been used as a drive and as a feeding corral, so it was especially packed. It was plowed late. Big hard clods of the fine red clay turned up with sharp edges that became painful for the horses. Mr. Alexander tried to harrow it down but made no impression. He tried to disk it, but the disk pulled so heavy and the horses stumbled so badly among the clods that he didn't do much and the clods remained all summer.

Last fall Mr. Alexander bought a 6-12 tractor; and about Feb. 1, he plowed this piece, turning it up again in chunks (though not so hard, due to winter moisture). The tractor didn't get sore feet, but pulled a double disk over the chunks immediately, cutting them down pretty well and crushing many with the wheels. Another disking was expected to put it in good shape.

Meanwhile the rest of the orchard was being disked in mid-February to conserve moisture until it could be plowed. This seems especially necessary since the past dry winter; although Mr. Alexander has two wells from which the water would soften the land if that expense becomes necessary before he can get it all plowed. At any rate, working the top soil prevents turning under big clods which would hold air spaces in the furrows and dry out quickly. When the ground dries as deep as it is plowed, tree roots have a poor chance to make a living. The six-foot double disk of 20 disks was cutting the soil pretty fine and reasonably deep, being loaded with about 250 pounds of rock and iron. They were angled about 25 degrees from a straight line and half of them are cutaways.

"I had four head of stock weighing about 4550 pounds on the disk all last summer; but even then I couldn't angle the disks as I do now and keep going at any speed. With the machine, I can lead the disk so it goes deeper than I ever could with the teams," said Mr. Alexander.

Most of the materials recommended to prevent motor car radiators from freezing have a detrimental effect on the parts which they touch. However, denatured alcohol (tax-free ethyl alcohol) gives good results without injury. A quart to each gallon of water is sufficient.

Constant Service SAMSON SIEVE-GRIP

Pat. and Reg. U. S. and Foreign Countries

TRACTORS

will stand by you in the rush season, and all the year 'round. Their steel construction, dust-proof qualities, oversize bearings and thorough lubrication insure constant service at low cost. The world-known Sieve-Grip wheel gives complete traction—no slipping, no soil packing.

You Can Do Better Work

in the orchard and field with a Samson Sieve-Grip Tractor. Your plowing and cultivating will be easier, crops larger and expenses less. Your farming business needs a Samson Sieve-Grip. By placing your order NOW, you will get your tractor when you want it. Though the demand for Samson Sieve-Grips is tremendous, we can make deliveries on time.

Samson Sieve-Grips are built in two sizes—10-25 at \$1350 and 6-12 at \$775, f. o. b. Stockton.

Creamerymen Advocate Cow-Testing.

The movement for better dairy cows has never been so strong in California as at the present time, for not only are concerted drives being made on dairymen to use well-bred bulls by breeders, but there is continual agitation favoring the more general weighing and testing of milk on dairies.

In the past creamerymen as a whole have assumed a rather indifferent attitude toward cow-testing associations and some such associations have made the mistake of signing up members on the argument that such testing would give an accurate check on the creamery and that the testing fee would be more than saved on that point alone.

Really the cow-testing association's chief function is to eliminate the poor-producing cows and in this manner save more than enough feed and labor to more than pay the small annual testing charge per cow and it is on this basis that the creamerymen of the State, through the Cal. Creamery Operators' Ass'n, have passed a strong resolution endorsing the cow-testing associations of the State and agree to lend all possible support to both old and new organizations of this kind. In a letter recently received from that organization it is pointed out that in the last few years land prices have risen enormously, rents have ad-

vanced greatly, wages have climbed steadily and new sanitary laws have laid additional burdens on the dairymen.

It is claimed that during the period of advancing prices and values dairymen have made more money by trading leases and selling cattle than they have from actual dairy operations. Those opportunities, it is pointed out, are over, and the dairyman who would stay in the business and meet the increased cost of production has only the one recourse left: that of increasing the butterfat production per cow.

Among other things this calls for the use of purebred bulls, the raising of all heifers and the weeding out of all cows in the herd which fail to be heavy and persistent producers of butterfat.

To some it may seem peculiar that the creamerymen should take such a decided interest in the welfare of the dairymen, but this is logically explained by reference in the letter to the fact that unless the dairy industry continues to expand, the creamery business will also stand still. It is gratifying to learn that the interests dependent upon the dairyman are beginning to understand that what is good for the producer must ultimately be good for all connected with the industry—in short, their interests are mutual.

Profitable Goat-Raising.

[Written for Pacific Rural Press by O. L. Linn.]

Mr. Ed Morse of Stanislaus county has gone far enough in the goat business to give some valuable data on that industry which may be of interest to others.

At present Mr. Morse has a herd of only 34 goats, all of which are of the milk variety, some of them as much as five-sixths pure blood. He has no difficulty in disposing of his stock at from \$30 to \$50 per head, and when it is remembered that each female produces an average of two kids a year it can be readily seen how remunerative the business is. It is generally understood that one cow will eat as much as eight goats and from the standpoint of the off-

spring alone it is readily seen that, so far as Mr. Morse is concerned, the cow is not in it with the "Mrs. Nanny." According to Mr. Morse a good goat will give around nine pounds of milk a day, and, taking the average test of a Holstein cow, this milk would be worth (at present prices) about \$4.00 per month and here again we compute what eight goats would produce on the equal food consumption of one cow, but of course it is admitted that it is some more work to milk eight goats than one cow. Mr. Morse finds ready sale for his milk at a cheese factory, where it is converted into cheese for which use the goat is again famous.

A Better Way with Kicking Cows.

To the Editor: I noticed in a recent issue a description of a contrivance for a kicking cow. In view of the fact that most kicking cows are of nervous temperament and as apt to stand on their heads as on their feet, the device mentioned does not appeal to me because of the difficulty one would have in unfastening it, as the writer described it as being made of strap-irons and chain.

A simpler device can be made of an old halter rope in the following fashion: Take a piece of rope 30 to 40 inches long. Make a spliced loop on one end and tie a small piece of wood to the other end about three

or four inches long, tying the rope around the middle of the stick.

Put the rope around the left leg of the cow, just above the hock first, twisting the rope gently but allowing enough surplus to go around the right leg. Then put the piece of wood through the spliced loop making it act as a sort of a key. Not only can such a device be quickly and cheaply made, but it can be quickly cut from the cow in case she falls down and continues to kick. I have recently seen this in use on Mr. T. Lynch's ranch in Contra Costa county and I have used it successfully on father's ranch.—P. H. Pearson.

Corn Silage in San Fernando Valley.

Two silos of 260 tons each were filled last fall by Jas. J. Jeffries of Los Angeles county from 16 acres of Eureka Ensilage corn and 10 acres of Hickory King. This year he ex-

pects 20 acres to do it. Last year it was drilled in rows three feet apart about June 28. This year it will be checked about June 1 to give it a longer growing season and more

room for leaves. Last year not a sucker grew on the Eureka variety. Six acres of this filled a silo half full; while it took the 10 acres of Hickory King to finish that silo. Only the Eureka will be planted this year, on alfalfa land being plowed early in February.

"I never saw such stuff to grow," says he. "Sixteen feet high, thick in the row, regular canebrake, one to three ears per stalk, and the roots made a solid mat between the rows."

"Had to cut it by hand. Took two men to handle a stalk. So brittle it would break in the middle if one man handled it. Stalks were big, too, but it was so tender that the silage cutter chopped it about as easy as ordinary corn. Sweet, too! We used a big cutter and a 25-h.p. motor. I've ordered 500 pounds to plant this year. Think I'll raise two acres of it for seed."

MAN-LOVING LIONS AND BEARS.

Mountain lions will never attack people except in self-defense, according to Prof. Joseph Grinnell, director of the University of California museum of vertebrate zoology. Every rumor or account of an attack on human beings by mountain lions that the press clippings have brought to the attention of Dr. C. Hart Merriam of the United States Biological Survey for a number of years past has been carefully investigated, and never once has he been able to find an authentic instance of an attack on human beings by a mountain lion. For years Professor Grinnell and his associates have been investigating every rumor they could hear of an attack upon people by a California bear, but never once have they been able to find an authentic instance of an attack by a California bear—since the day of the grizzly—except to defend itself or its cubs against attack.

The silo prevents the waste of the stalks, leaves, and husks, which contain two-fifths of the total feeding value of the corn.

If the cut corn is not thoroughly mixed before being blown into the silo, it will settle very unevenly, spoiled silage probably resulting.

In six or eight weeks the silage will be ready for feed.

BERNSTEIN'S RANCH

Establishing a Minimum Cow Production.

[Written for Pacific Rural Press.]

Should the dairy farmer have a minimum requirement for each and every cow in his herd and sell her if she does not come up to the standard? Most dairymen who weigh or test their milk believe in such a standard, but few are so exacting in this respect as K. W. Abbott of Santa

their first calf is 6,000 pounds during a 10-month lactation period and that for heifers with their second calf is 7,000 pounds, but Mr. Abbott finds that these are below what he actually secures. But the majority of heifers who produce these totals in their respective classes have little

Standard for Mature Cows.

No. of months fresh.....	1	2	3	4	5	6	7	8	9	10
Pounds Milk.....	1150	2250	3300	4300	5250	6150	7000	7800	8500	9100

Clara county, who usually milks about 60 cows.

When he took the management of his present dairy several years ago he began to systematically weigh the milk of each cow twice a month, once about the middle of the month and again on the first of the month. By multiplying these weights by the number of milkings intervening between weighings the total production is secured for the month. As the milk is sold whole, testing for butterfat is not considered essential.

These milk weights are credited opposite each cow's name on the record book under the monthly column for which they were made, each month's weighing being added to the total of the previous month so that production to date for each month of the lactation period may be readily ascertained.

At the top of each page of the record book the minimum requirements in milk, both for the month and for the entire lactation period is given above.

The requirement for heifers with

AGE TO BREED HEIFER.

To the Editor: What is the best age to breed a Durham heifer? Some years ago I had a fine large Durham heifer, which I bred after she was a little over two years old. She made a big fine cow, but she was a failure as a milker and I sold her to the butcher. I have a Durham heifer now, which was bred at nineteen months, and one a year younger—she is a little over 14 months—which came in heat regularly since she was nine months old. Would it be advisable to breed her March or April? She is large and well developed for her age. I thought the failure of the first one to make a good milk cow was partly caused by letting her get too old.—F. W., Chico.

If she is well developed she may be bred as you suggest in March or April. This would make her fresher at 25 to 26 months which is old enough under normal conditions. Experienced breeders depend more upon the size of a heifer than upon her age, on the ground that a small, undersized heifer will make a smaller cow if bred young than if allowed to develop before breeding. It does not seem probable that the age of your other heifer, before breeding, had anything to do with her producing qualities. The only danger of allowing them to get too old is the trouble sometimes experienced in getting them with calf.—Eds.

Silage corn may be planted about half again as thick as ordinary corn. Drill it in rows, dropping it every seven or eight inches.

Economical Hog Shade Saves Fat.

[Written for Pacific Rural Press.]

One man the humane society ought to get after is the Sacramento valley farmer who turned his hogs onto grain stubble without providing any shade. Aside from this cruelty and the loss of fat which fried out of the pigs, the lack of shade prevented economical use of the feed, and that farmer thinks there is nothing in raising pork.

Expense of constructing shade was no excuse, for many farmers with less money than he have constructed shades which are effective, if not as ornamental. L. F. Killenbeck of Orland laid old boards across the corners of his panel fences but even this expense could be reduced. Elmer Lamb of Ceres set four fence

posts in the hog pen in a 10-foot square and laid 1x8 boards across 2x4s nailed high enough on the posts to let the hogs under nicely. A layer of hay or straw completed the shade. All the breezes that come along may sweep under the shelter. For winter protection, movable V-type houses were built of 1x10 boards set several inches apart and the cracks covered by 1x8's; the peak being fastened tight by nailing the upper end of the other side together. The windward end is covered with 1x8's; the other end is open except for a brace half way up. The lower ends of the boards constituting the sides, are nailed to 2x8 runners braced across the bottom.

Setting a Standard of Weights.

Perhaps the ideal type of the various breeds of livestock will never be developed for the very good reason that views differ as to which type is more profitable. But on one point all are agreed and that is that, other things being equal, a good big animal is preferable to a good little one.

Many times breeders as well as farmers do not secure maximum or even minimum sizes in the breeds they are breeding, chiefly because they are poor feeders and do not develop their animals intelligently. That feeding and environment play an important part in the development of animals may be readily ascertained by comparing the relative size of animals grown on irrigated areas with those grown on semi-arid hill pastures, where the feed supply is low for a considerable portion of the year.

To acquaint breeders and farmers with the approximate weights animals of the various breeds should attain at given ages, Wm. Hislop, Animal Husbandman of the State Agricultural Experiment Station at Pullman, Washington, has compiled the following tables that should act as a minimum, rather than a maximum, size, providing quality can be

secured with the additional size:

Weights of Beef Breeds.

Breed of Cattle	Sex	One year	Two years	Three years	Four years and over
Shorthorn	B	925	1400	1725	2000
	C	825	1300	1625	1725
Hereford	B	900	1350	1700	2000
	C	800	1275	1625	1700
Aberdeen Angus	B	850	1225	1625	1950
	C	700	1180	1525	1625
Galloway	B	800	1175	1525	1800
	C	675	1050	1350	1500

Weights of Swine.

Breeds of Swine	Sex	Six mos.	One year	Two years and over
Poland-China	B	165	340	600

	E	70	125	150

High-Priced Steers.

[Written for Pacific Rural Press.]

A bunch of 235 grade Shorthorn steers averaging about 1250 pounds was sold by T. T. Miller Jan. 25 for delivery to a Los Angeles firm at 8 3/4 cents per pound, a total well over \$20,000 f. o. b. cars at Calexico.

The high price was due to two features of the herd as gathered by our staff writer from Mr. Miller and his ranch superintendent, B. L. Roberts.

They were a uniform lot. They were of high quality.

Their uniformity was due to their purebred sires for many generations back, the range in Lower California from which they were obtained by Mr. Miller as short yearlings having been stocked with purebred Shorthorn bulls for many years, though a few Herefords had been mixed in. Thus they were a uniform lot when

obtained by Mr. Miller; and they developed uniformly.

Their quality also was largely due to the breeding. At the time of sale, Mr. Miller thought they would dress out 52 or 53 per cent; but the buyer figured on 58 per cent.

Their last sixteen days had been spent on alfalfa pasture with alfalfa hay ad libitum. Mr. Miller estimates that they ate about 20 pounds of hay per day. The pasture was 40 acres that had been "nursed along" so the alfalfa and barley were several inches high.

For two or three months previous to the alfalfa feed, they had been on milo corn stalks, the milo heads having been harvested. Previous to that, they had simply followed other steers, roughing it as best they might.

Card-Indexing Grade-Cow Life Histories.

[Written for Pacific Rural Press.]

Though Ennis and Williamson of Riverside have only two purebred females in their 140 cows, they believe it is none the less necessary to keep records of their grades in order to handle them intelligently.

Every cow has an aluminum tag in her ear, with a number to correspond with a record in the card index. In addition, the young heifers are being branded.

Each card has a tab, on which the number is marked. The tabs are located each one at the right of the one in front of it, 10 in a series, to make them easy to find.

The entire life history of each cow is entered on these cards, data being taken from the field book carried all the time by Supt. McCord.

The record includes the name of the man from whom the animal was secured, dates of freshening, sex and

sire of each calf, when bred again, to which bull, and the monthly butterfat test of a mixed sample from two consecutive milkings with the weight of milk.

All events, such as premature loss of calf, tuberculin testing, veterinary troubles, dehorning, etc., are also noted. When one card is filled, it is a simple matter to put another card without a tab directly behind, so that it takes no time at all to look up the entire history of any animal.

On the adult animal the horns may be removed by the use of the saw or clipper. In either case the cut should be close enough to the head to leave a ring of hair on the part that is removed, otherwise there is likely to be a stubby growth of horn appear in a year or two.

CARRUTHERS' FARMS FIRST ANNUAL

Shorthorn Sale

MAY 2nd, 1917

MAYFIELD, CAL.

Watch this Space for Later Announcements.

ORMONDALE SHORTHORNS

Golden Goods, Jr., Herd Sire.

Our 1916-17 offering of yearling bulls is small but select. They are all heavy boned, solid red in color and of Scotch and Scotch-topped breeding. Suited for either the range grower or breeder.

DUROCS.

Our Durocs are of the big type, with big bone, well-arched backs and carrying good hams.

We have a few head of service boars, now ready for service, solid red in color and out of prize-winning animals.

Every Animal Positively Guaranteed

Whether you buy or not, visit our ranch, 7 miles from Palo Alto on Woodside Road. We welcome inspection. Prices and pedigrees on application.

Berkshire Congress and Sale.

A three-day session of the Western Berkshire Congress was held at Davis last week and was well attended. On Tuesday an interesting demonstration of hog carcasses was given, E. J. Lovejoy and L. E. Frost of Illinois assisting.

At the annual meeting Wednesday evening F. R. Steel of Grants Pass, Ore., was elected president, Arlington Smith of Visalia, secretary, and Chas. M. Talmadge of Newport, Wash., vice-president. The Salem, Oregon, State Fair was named as the place for the next Western Congress Show. Plans of the American Berkshire Congress for further exploiting the Berkshire breed and \$10,000 advertising campaign were endorsed, and a supporting vote was given to the National Swine Show at Omaha. Establishing a register of merit for Berkshire hogs based on production and show record was suggested, and the following committee appointed to work it out: L. E. Frost, F. R. Steel, A. B. Humphrey and J. I. Thompson.

On Wednesday afternoon a judging contest for women was held, and in the evening the annual love feast and banquet. Thursday was given over to the Congress Sale.

At the sale forty-eight head of Berkshires brought \$6280, an average of \$130.85 per head. Forty-two were bred sows and these averaged

\$140 per head. The top price was paid by Harry Moore of Moore, Pitman Co., Indianapolis, for a sow consigned by A. B. Humphrey and bred to Grand Leader 2nd. Five head consigned by H. L. and E. H. Murphy averaged \$150 each. Other consignors to the sale were: Dean Beeman, Butte City Ranch, F. L. & L. S. Hall, University of California, Whitehall Estates, Geo. M. York & Sons, James Mills Orchard Co., Oak Grove Farm, Frank A. Brush, Arlington M. Smith; W. S. Corsa, Whitehall, Ill.; Chas. M. Talmadge, Newport, Wash.; Peer & Banks, Tacoma, Wash.; D. C. Bunn, Prosser, Wash., and Winona Ranch, Grants Pass, Oregon.

Geo. P. Smith, buying for H. W. Rice, a large plantation owner and stockman of Makawao, Maui, Hawaii, bought six head for \$1135; F. B. Anderson of Sacramento, six head for \$560; Geo. Kounias of Modesto, three head for \$565; Homer Hewins of Calistoga secured for \$330, a fine sow bred to Superbus and consigned by W. S. Corsa of Illinois.

Other buyers were A. B. Humphrey, A. J. Lovejoy, C. Henry of Greeley, Neb., J. E. Hall, A. L. Stephenson, Frank Brush, Arlington Smith, A. L. Bovall, W. M. Caruthers, W. R. Wright, A. Platz, Geo. J. Carr, Mrs. Grace Ames, and H. L. & E. H. Murphy.

SEE SERUM LABELS BEFORE VACCINATION.

[Written for Pacific Rural Press.]

Loss of a large per cent of previously healthy hogs which begin to show symptoms of cholera 7 to 11 days after vaccination, is inexcusable; yet that has happened frequently in various parts of the State. Our attention was recently called to this by several growers in Imperial county. Usually accompanying such loss due to vaccination is a circumstance unnoted by most such losers. If the serum bottles have been left on the place, the labels have been scratched off! The outfit which uses serum so old that it has lost its potency or that has soured due to hauling around the country in hot weather, cannot be punished too severely. He not only engenders a false sense of security; but in the simultaneous vaccination, he actually introduces the disease into every herd such serum is used on.

Labels Tell Age.—Each bottle of serum must be stamped with a date after which it must not be used. Serum will keep good a year if kept cold. The growers who complained of losing their stock had in each case looked up the bottles after the hogs sickened. In each case the labels had been scratched off. Lack of a label is the best kind of evidence that there is something wrong. Both the date and the number of each bottle should be recorded until all chances of infection are past.

Dr. B. J. Cady of the U. S. Dept. of Agriculture gave one of the growers to understand that if the numbers on the bottles used on his herd which sickened after vaccination could be secured, the serum users could be held responsible for hogs lost, or their license to make serum would be revoked.

Pork Imports and Packing Plants.

To the Editor: Can you give me data as to the amount of pork products shipped into California each year, both fresh and as cured products? Can you also give me figures as to the approximate cost of establishing a killing and packing plant which would handle about a carload each of hogs and beef per day?—H. K. D., Kerman.

[It is generally calculated that California imports of pork and pork products is worth about \$15,000,000 annually. We cannot correlate cost of packing plants and capacity. You will find interesting data upon the cost and capitalization of packing plants large and small in "Report No. 113 on Methods and Cost of Marketing Livestock and Meats" which

you can get by sending 25c to "Superintendent of Documents," Government Printing Office, Washington, D. C.—Eds.]

REMOVABLE HOG PENS.

[Written for Pacific Rural Press.]

If you should have to move your hog pens on account of disease or mud, etc., would it be a big job? Not for W. W. Cochran of Imperial county. His pens are made of panels about 4x16 feet, each one made of four 1x6's. They are supported every eight feet by posts made of old railroad ties which normally cost 20 cents each, but were bought cheaper

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

Western Meat Company

Animal Food Dept. 704 Townsend St., San Francisco

in two carloads. Along the tops of these ties is nailed two-inch second-hand lumber. The panels are fastened to the posts by wires which can be easily cut in case the pens must be removed.

For farrowing pens 1x3 stuff is used for the panels, which are wired to 4x4 posts. The roof for hot weather is made by laying a few inches of water-grass on top of woven wire which rests on 1½-inch stuff. The watergrass is to be mostly removed next winter to let maximum sunshine in. Perhaps some sort of shelter will be provided, for Imperial Valley does sometimes get as much as five inches of rain per year.

A record of the weight of the milk at each milking should be kept and the per cent of butter fat should be ascertained twice a month with a Babcock tester.

Inbreeding is the quickest way of fixing desirable characteristics, but it also fixes any undesirable characteristics that may exist and may destroy constitution and vigor.

DAIRYING.

There are about 1,000 cows in the Yolo-Solano-Colusa Cow Testing Ass'n, which has 33 members.

The reorganized California Holstein Breeders' Association will hold its first meeting at Napa May 5.

The American Guernsey Cattle Club will hold its annual meeting May 16, 1917, in New York City.

An Eastern Guernsey junior three-year-old has just completed a record of 14,219.8 pounds milk and 708.69 pounds fat.

Collins Bros. of San Leandro, who are supplying San Francisco hospitals with milk from 175 cows, have about 20 registered Guernseys.

Sixty grade cows auctioned at an average of \$97.65 on the Tony Amantis ranch of Ceres recently. One grade Holstein brought \$255.

The Porterville Co-operative Creamery has been leased for five years to the Exeter Creamery Co.; but the same brands will be used as before for the local output.

M. Hugener of Byron reports the purchase of the young Holstein bull Canary Segis Butter Boy, sired by Segis Pontiac De Kol Burke, grand champion Cal. State Fair, 1916.

J. S. Watson of Dixon reports that his herd of about 100 grade cows averaged 6,407.5 pounds of milk for the year, about one-fifth more than before he weeded out his boarders by testing.

The three creameries of Tulare recently paid out over \$100,000 for January butterfat. Prices ranged from 42 to 45½ cents for fat in cream, and up to 52 cents for fat in whole milk.

The Modesto casein factory is establishing stations at Crow's Landing, Gustine, and Los Banos to ship curds to the central factory. Skim milk has been contracted at 20 cents per cwt. on the farm.

The Bridgford Co. of Knightsen have just finished testing eleven cows 3½ to 7 years old which made 22.59 to 31.7 pounds butter and 449.6 to 640.5 pounds milk in seven days. Eight of them made over 25 pounds each.

The Western Dairy Products Show, to be held in Portland, Ore., Mar. 1 and 2, will include a program of exceptional interest led by U. S. Dept. Agr. investigators and dairy instructors of the Western colleges, and including discussions of the papers read.

The Gotshall Cattle Co. of Ripon are making extensive improvements on their ranch. They have 48 registered Holstein cattle, including 17 A. R. O. cows, a daughter of King of the Pontiacs, senior herd sire King Pontiac Ormsby Segis, and a junior sire who is a grandson of Colantha Johanna Lad.

The Holstein cattle sale of the California Pedigree and Sales Co. of Sacramento, which was to be held May 25 and 26 at the State Fair Grounds, has been postponed to the following week and the location changed to Davis. Thus it will come during Farmers' Week at University Farm and will not conflict with the Butte County Spring Festival.

A two-year Guernsey heifer owned in New York produced 12,378.8 pounds milk containing 711.43 pounds fat in one year of her first lactation period. She gained 200 pounds' weight during 14 months of lactation, producing each month more than her own weight of 5.75 per cent milk. She has been carrying a calf several months.

Australian butter will be the only real competitor of California butter in China after the war, according to a consular report. European and Siberian butter as well as the negligible home product, have proved very inferior. European tinned

cheeses, however, have been selling higher than the American product, due to our lack of cold storage facilities.

A. E. Slater of Pacheco, Contra Costa county, reports importation of a registered Holstein bull developed by Cornell University, New York.

Miss Valley Mead De Kol Walker, owned by the Santa Anita Rancho, freshened at 2½ years, and in a test begun 243 days from freshening produced in seven days 407.1 pounds milk containing 16.942 pounds fat. Her sire is Prince Gelsche Walker and her dam De Kol of Valley Mead.

The Alpine Evaporated Cream Co. has announced that a bonus will be paid Jan. 1, 1918, to all dairymen who bring their milk regularly to the factory throughout 1917. The first bonus was announced recently as eight cents per cwt. for the 4 per cent milk brought to the factory during January. They recently shipped 2125 cases of condensed milk to the Philippines.

Recent Jersey cattle sales of N. H. Locke Co., Lockeford, Cal., are: To A. J. and Nellie A. Morey, Orland, 5 heifers, carrying the blood of King's Valet, Grace's Fox, and Gertie's Son, and a young son of King's Valet and San Joaquin's Lottie, a cow of great capacity and large production, a foundation herd; to R. R. Smith, Orland, 6 young cows of good production, carrying the lines of the N. H. Locke Co. producing sires; to E. C. Rand of Brae Bourne Ranch, Santa Rosa, King's Gordon Fox of L, a great-grandson of King's Valet, Empress Lass and Champion Flying Fox.

HOGS.

Harry Murphy of Perkins has gone to Oklahoma to purchase a few carloads of Shorthorn heifers and bulls.

The River Bend Farm of St. Helena has just received two Duroc gilts from Ohio. They are bred to Tippy Col.

The River Bend Farm of St. Helena reports its four Defender-Orions Pal boars to be developing into championship form for the next State Fair. They average close to 200 pounds at five months.

The Imperial County Farm Bureau is working on a plan to grade hogs before shipment and ship in carlots of uniform size and quality to Los Angeles in order to make it pay better to raise good hogs.

County Counsel Murphy of Los Angeles is drawing up for the Board of Supervisors an ordinance that will require all garbage served on the big hog ranches in the county be sterilized by cooking at not less than 240 degrees F.

BEEF, SHEEP, MISCELLANEOUS.

Recent rains have simplified beef and sheep raising problems. Feed shortage was getting serious.

R. M. Dunlap of San Francisco writes from Omaha that he is to be home with some fine beef stock this week.

It is reported that Wm. H. Moffat of Nevada is contracting for unborn lambs to be delivered next fall at \$8 a head.

The Tulare County Pure Stock Breeders' Ass'n is already actively laying plans to help the fall livestock show to be held in Visalia just after the Kings County Fair.

The Golconda Cattle Co., which has 50,000 acres and about 25,000 sheep besides horses and cattle in Elko and Humboldt counties, Nevada, is arranging to dispose of this property.

New and simplified Government regulations concerning disinfection of imported hides to avoid bringing in anthrax, rinderpest, and foot-and-mouth disease, went into effect Jan. 1.

David J. Stollery, Sec'y of the

newly formed Cal. Shorthorn Breeders' Ass'n, informs us that the directors have signed articles of incorporation with a capital stock of \$5,000. There will be 5000 shares of stock issued with a par value of \$1 per share.

The community auction sale held by the Wasco Farm Bureau Center drew about 500 people and resulted in the sale of \$4758 worth. H. G. Hull sold 185 hogs averaging about 190 pounds, at \$9.40 f. o. b. Wasco, to a Los Angeles packer. Other similar auctions are to follow.

About 7000 cattle and sheep were reported lost on the National Forest Ranges of California in 1916. Of these, 1246 died of disease, 1552 from poison plants, 2249 from predatory animals, 1845 from accidents, etc. A total of 417,045 sheep and goats and 194,892 cattle and horses were grazed.

A Suisun subscriber believes that Senate bill 159 is written and pushed by a few wealthy cattlemen and is likely to seriously injure smaller beef raisers throughout the State if it becomes law. Every cattleman should get a copy at his library and study it; then inform his representative and senator as to his views.

The California Fair and Racing Ass'n is to meet at 1 p. m. Feb. 24 at Hotel Manx, San Francisco, to perfect organization and arrange a circuit for 1917 with uniform rules of operation. All interested in the annual fairs and race meetings in California are invited to attend. This seems to us good and commendable so long as they play fair and keep out gambling.

Ord L. Leachman, livestock marketing agent of the Glenn County Farm Bureau, has been in San Francisco the past week looking into the meat packing situation with a view of becoming thoroughly acquainted with that side of the livestock marketing problem. He represents over 200 farmers in Glenn county, receiving as payment for his work a 5 per cent commission on everything sold in less than carload lots and 4 per cent on carlots or more.

Another step in the way of co-operative marketing is being taken by the farmers about Ripon in the preparation for the big community auction sale that they have announced for March 3. A man is in the field listing things for sale and already over \$4000 worth of stock or farm articles of various sorts have been listed. A small commission of 1½ per cent will be charged to cover the expenses. Each person listing anything for sale has the privilege of one bid and all he is out if his goods are not sold is the trouble to which he has been placed in getting them to the sale and home again.

HORSES AND MULES.

A farm team auctioned at \$305 and a two-year colt for \$112.50 at a recent sale near Ceres.

George Gage of Sutter county is reported to be using music to charm the savage mules when breaking them to work. Must be rough riding for the music box.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

The Percheron Society of America offers prizes to be awarded to registered Percheron mares and stallions at the State Fairs of California, Oregon, and Washington, and many others.

American mules are reported to instill confidence in European soldiers by their nonchalance under fire and their endurance of hardships. In the Somme battle it is said that in proportion to the number used, one mule outlasted six horses.

The admission to registry in the Percheron Society of America of Percherons heretofore recorded in the Forney or French Draft Associations, tracing to imported stock, or to animals of record in the Percheron Society, has aroused great interest, and a great many breeders made every effort to avail themselves of the opportunity to record their animals before the time limit expired Feb. 12. The delays incident to obtaining necessary evidence have been such that the Board of Directors granted an extension of the time limit for the admission of such animals until May 1, 1917. The officials of the Forney Association have lent all possible aid to breeders desiring to transfer their Percherons to the Percheron Society of America, and J. F. and J. A. Forney themselves (J. A. Forney being the Secretary of the so-called Forney Association) completed applications Feb. 8 for the registration of 117 Percherons heretofore recorded in the so-called Forney Association, which they desired to have transferred to the Percheron Society of America.

IMPERIAL DUROC-JERSEY SALE.

Nineteen registered Durops of fancy championship breeding are to be auctioned at the Houck ranch near Grape, Imperial county, Feb. 26, at 10 a. m. Free conveyances will meet trains and free lunch will be served. The stock is largely of King the Col., Pathfinder, and Crim-son blood with some of Taxpayer and Commander breeding. Other hogs, cattle, horses, and machinery will also be sold to the highest bidders.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

FINE YOUNG JACKS and Jennies for sale. Black with white points. Eligible to register. Geo. A. Mast, Madison, Yolo Co., Cal.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Promoters, Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building, 625 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

High Production and Fat Prize from Grades

[Written for Pacific Rural Press.]

By securing an average of 1436.5 pounds milk containing 56.605 pounds of butterfat during the month of January for five grade cows, K. W. Abbott of Milpitas, Santa Clara county, was able not only to win the monthly prize of \$25, given by Pacific Rural Press to competitors in the California State Dairy Cow Competition, but was also to exceed the average fat and milk production of the November and December prize-winners. The best herd competing for this prize in November averaged 1276.8 pounds milk and 46.587 pounds fat, and the December winners averaged 1085.4 pounds milk, containing 49.31 pounds fat.

While little is known about the breeding of the January winners, they are all distinctly Holstein in appearance so far as color is concerned, although some of them are small of frame, of extreme dairy type and high testing, thus indicating Jersey crosses some time in the past.

Preparation.—No preparation previous to the beginning of the testing was done by Mr. Abbott, other than that ordinarily done with the entire herd of some 60 cows which are milked on the ranch. Always it is the practice to start to dry the cows up at ten months after freshening, having them completely dry for a month or six weeks before freshening, during which time they are run on salt-grass pasture and fed the refuse hay from the milking cows' feed-racks. About a week before freshening time the cows were taken up and put in the regular strings at the milking barn, where they were fed the same mixture as given the fresh cows, but in smaller quantities. This is gradually increased after freshening till they are on full feed.

In selecting the contest cows, general conformation was the chief reliance in several cases owing to the fact that nothing of their past history was known. With others, however, the regular twice-a-month weighing of the milk which is practiced with all of the cows was used to good advantage, as it gave a fairly good idea of the heavy-producing cows. For the purpose of picking contest cows, however, it was not as reliable as it might have been, as no milk testing is ever done, the milk being sold as whole milk and only the average test of the entire herd being considered necessary.

Feeds.—The feeding of this heifer differs from that of most other herds in the State because of the amount of pea-vine silage which is used in the ration. This is a by-product of the pea canneries that is siloed in the ordinary manner, and compares favorably with corn silage. By furnishing succulence it is a good substitute for pasture, as is the case with other siloed crops. The amount of this consumed by the winning cows is difficult to estimate, as they were fed silage in the corrals with the other cows. The practice is to have two feeding corrals, a load of silage being hauled into each field, where it is dumped into troughs. The cows have access to the silage in one corral in the daytime and the

other one at night, eating as much as they care for.

Alfalfa hay is used as a roughage, only five pounds per day per cow having been fed to the contest cows. This was baled hay, purchased from the grower and of just ordinary quality.

The concentrated feeding stuffs used for the entire herd are in the following proportions: Dried beet pulp, 100 pounds; Suremilk, 100 pounds, and 110 pounds bran. The beet pulp is mixed with sufficient water to thoroughly moisten it and then well mixed with the bran and Suremilk. A scoopful of this mixture was fed twice a day to each test cow.

The Cows.—Melba, the highest testing cow of the five, was purchased Dec. 4, 1916, with some others from a herd that looked to be poorly bred and cared for. She dropped her calf on the railroad car, milking about two months before she was put on test. She is an old cow, small in frame, possessing good dairy type, but not expected to do much when testing was started. She was bred January 10, and is safe in calf. While Holstein in color, she apparently has considerable Jersey blood in her, judging by size of frame and test of milk. Her production for the month was 1457 pounds milk containing 62.360 pounds fat with a test of 4.28 per cent.

Pet, the second of the five, is about six or seven years old, having been selected several years ago with 13 others as the best prospects in a herd of 300 head of grades. Her milk has been regularly weighed since she was added to the Abbott herd and she was considered a likely prospect on that account. She was dry 63 days, freshening December 24. During the month she produced 1605.8 pounds milk containing 59.415 pounds fat having an average test of 3.70 per cent. She is doubtless of Holstein breeding, being moderately large and well marked.

Rilla, third in the list, is all black in color, about six or seven years old. While not bred by Mr. Abbott, she has been in his herd four years, being among the best 10 or 12 cows in the herd during 1916, with a nine months' production of 10,450 pounds milk. During the first three months of her present lactation period she has produced 5,073 pounds milk as compared to 4,393 pounds during the first three months during 1916. She was dry 58 days before freshening October 13. During January she produced 1661.6 pounds milk containing 56.328 pounds fat with an average test of 3.39 per cent.

Rosie, fourth from the top, is thought to be purebred, although her previous owner lost track of his breeding records and sold her as a grade. She is about seven years old, of moderate size, narrow but deep barrel and otherwise of good dairy type. In previous years she has never been a heavy milker but has been a persistent one always. She was dry 72 days, freshening October 11, producing during January 1181.1 pounds milk, containing 52.677 pounds fat with an average test of 4.46 per cent.

Remco

SILOS TANKS PIPE

For dairymen, farmers, feeders in all sizes and proportions.

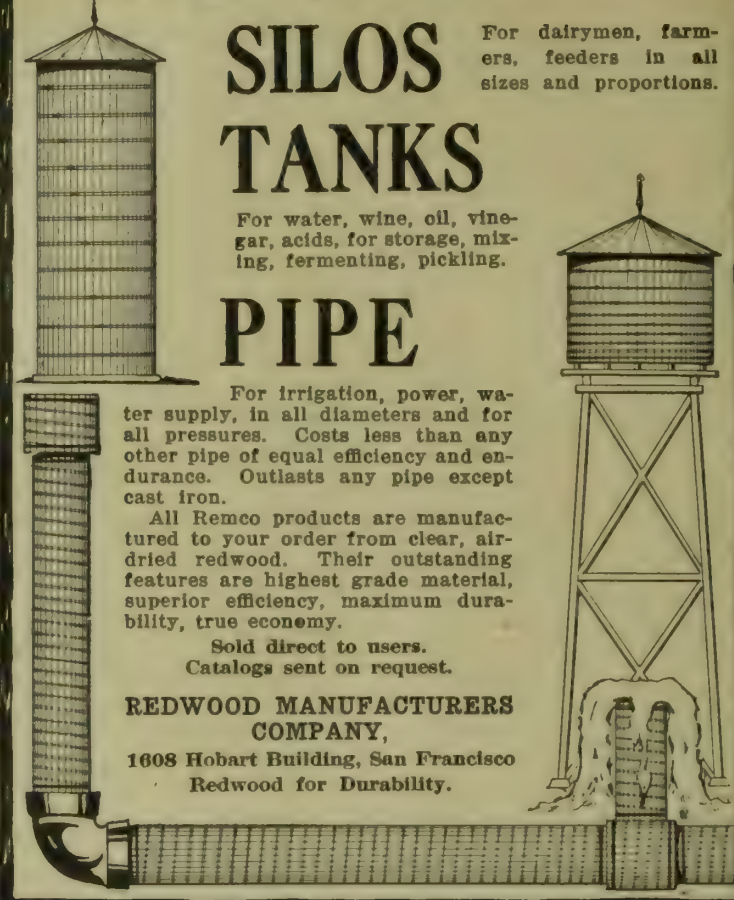

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

Sold direct to users.
Catalogs sent on request.

GRANDSONS OF TILLY ALCARTRA

We now offer two young bulls for sale that are old enough for service. No. 1—Born Sept. 13, 1915.

Prince Alcartra Korndyke.
Best bred son of Tilly Alcartra.

No. 2—Born Sept. 2, 1915. His dam is a 21-25 4-yr old, sired by a son of Beryl Wayne Korndyke, who has two 30 lb. daughters. His full sister has a record of 18.56 lbs. butter in 7 days at age of 2 years 3 months and will be kept on test for the year.

No. 2—Born Sept. 2, 1915. His dam is a heavy producer and will be put on test next time she freshens. His full sister has a record of 19.36 in 7 days at 2 years 6 months and will also be kept on test for the year. The bulls are nicely marked, have perfect top lines, are good individuals and both sired by Prince Alcartra Korndyke, who now has 6 A. R. O daughters and more coming.

Write for prices, or better come and see them.

J. S. GIBSON CO., Box 97 Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

This Guernsey Grade Cow produced yearly for five consecutive years an average of 11490 lbs. of milk and 604 lbs. of butter fat, equivalent to 705 lbs. of butter.

The American Guernsey Cattle Club
Box P.P. Peterboro, N. H.

Emeline was purchased in dam, born on the ranch June 22, 1912, and raised by Mr. Abbott. She was sired by a purebred bull and out of a grade cow. She is good sized and of satisfying dairy conformation, freshening with her second calf November 7, 1916, after being dry 52 days. Her January production was 1444.6 pounds milk, containing 52.150 pounds fat with an average test of 3.61 per cent.

Do not require the tired horse to stand on a floor sloping forward. He will not lie down and rest as he should.

The French View of American Horses.

What is said to be the first time in history for a French breeder to address a gathering of American breeders was at the meeting of the Kansas State Horse Breeders' Ass'n Feb. 9, when Louis Aveline, a breeder of Percherons before the war, in France, and since then in charge of horse buying for the Allies, in this country, addressed the gathering.

In commenting on the buying operations of his country in America Mr. Aveline said:

"In the beginning the needs of the war had compelled us to buy cavalry horses. We found them in Montana, Wyoming and Texas; a few in the East; that is, Virginia, Kentucky and Tennessee. Unfortunately, the western horses were a little wild and small. Later, our needs were especially for artillery and transport horses. Particularly in Iowa, Kansas, Nebraska and in the Western States, Oregon and Washington, we found very good artillery horses. [We presume California and Nevada horses were included in this reference.—Eds.]

"I must also say that the horses we like best for artillery service are those having Percheron blood. I do not say so because I am from Le Perche, but it is also the opinion of all the English, Italian and Belgian commissions. Nearly all these commissions can tell you by the qualities and defects of each horse presented of what descent it is, whether Percheron of Le Perche or of Clyde or Belgian. The English have even demanded in their contracts a certain proportion of horses with Percheron blood.

"The allies have bought nearly 1,000,000 horses in the United States, mostly artillery. The artillery horses that we buy are from 1100 to 1200 pounds in weight, many of them are of Percheron descent, while among the heavy artillery, or transport horses, which must weigh more than 1300 pounds, are found horses from all breeds. But, even in this class, we prefer descendants from Percherons, because with their bulk and heavy bones they always have energy and action which are not found in the descendants from the other breeds. They can trot, and even gallop. All grey horses (which proves that they are related to Percherons) are acceptable to my fellow-officers in active service. It is true, I am sure, that it is in this color that we find the greater proportion of our best horses. Unfortunately, we cannot accept them all, because the grey horse is too visible on the battlefield. But do not reject them for that reason. The war will not last forever, and

when the grey colts, which are born now, will reach the age when they can be sold, then the demand will not be for war horses, and at this time they will take grey horses indifferently."

Feeding.—Of the feeding and care of colts in France he stated that after weaning time, the colt is given about six pounds of oats every day in two times. The ration is increased to about fifteen pounds while he grows older. We always give crushed oats, as it is better digested by the colt. During winter, grass being scarce, we give plenty of hay to the colts under the sheds. The fillies are always kept by the farmer to take the place of the mares. He weans them himself, leaves them in the pastures until they are two years old, and then he begins to put them to work. When they are three years old, they can take the place of older mares, because when the mares, at a certain age, are not in foal or do not produce any more, or are not of an exceptional line of breeding, they are sold as draft horses, either at home or abroad. That is why the farmer in our country never has very old mares on hand. His stock is constantly renewed. We claim that an animal of young or middle age produces better than an old one.

That we have let our taste for size run away with our better judgment is the belief of Mr. Aveline, as quoted below:

"In the choice of stallions, we put less importance than the Americans on the weight. When you speak of a good horse here, they always ask: 'How much does he weigh?' You will never hear that in France. If we have heavy Percherons, we produce them by selection, no more no less than to meet the demand of the American market, because we find that the bigger the horse, the more apt to be lymphatic and slow it is.

"In regard to the selection of a stallion, I cannot insist too much on his line of breeding. The best horse does not always produce the best colts. But the best family of horses almost always gives the best results.

"As to your work horses, I have found them very good. I was even surprised to find such good horses, and I must confess that I bought lately on the St. Louis market some remarkable geldings and mares, the mares as good as those of our own production. I do not speak of geldings because we do not castrate our colts."

The stalls of the horse stable should not be planked clear to the top. Use planking only for a barrier, allowing free circulation of air.

ARE UMBRELLA TREE SEEDS DANGEROUS?

To the Editor: Are the seeds or balls of the umbrella tree poisonous to hogs or stock?—F. W. C., Coalinga.

[Answered by Dr. H. M. Hall, Berkeley.]

Reports as to the poisonous properties of the fruits of the umbrella tree are contradictory and I have no first-hand knowledge to offer. Bailey's Cyclopaedia of Horticulture states that birds and cattle feed upon them. Another report says that in Arizona hogs have been poisoned by eating the seeds and similar reports come in from time to time in California. It is possible that only certain kinds of animals are poisoned or that it requires a large amount of seed. At any rate, it is advisable to feed them cautiously, if at all, and to carefully watch animals that have access to the trees when the seeds are falling.

You Need a Robe

A HERCULES ROBE

In car or carriage, you need a robe—

- rubber faced for wet weather;
- fancy plush for festive occasions;
- all wool for all occasions.

Hercules Fringed Wool Robe in stylish plaids (not too gaudy)

large generous size, "warm as a house," \$6.50.

Protector rubber, plush lined, large size, for automobile, \$6.

Other kinds for \$2.50 to \$20.

You'll find our line at dealers in every trade center—at discriminating dealers. If yours does not carry them, you may order direct.

Raising Poultry for Profit

QUESTIONS AND ANSWERS.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

Chickens and Turkeys Ailing.—I have a flock of 100 R. I. Reds—pullets and cockerels. Suddenly the entire flock took cold, running at nostrils, eyes, etc. Some had pneumonia, rattling and kicking constantly. Those running at nostrils I treated successfully. On some of the pneumonia ones I used Bipene in nostrils and throats and blue-stone in the water and coal oil in the feed, which was bran or soaked barley. Some fat pullets that showed no signs of being sick died sitting or lying down. Some got lame in one leg and could not walk a step—never got better. I also lost several turkeys that showed little signs of illness. Some hens die while on the nest laying. Have not lost any for a week. I feed barley, bran and pumpkins and green barley for greens, and they have range.—Mrs. S. B. E.

You surely have your hands full, but the trouble has been that you did not catch the first ones that took cold and segregate them. If you had removed them and treated them with a little physic, then fed them well and cleaned up yards, houses, etc., you would have got them over it. Range stock are much more difficult to handle than yarded stock—it is harder to control them. Again, your feed is not good enough for sick fowls. All people who lose fowls by roup, colds or kindred diseases do so from two causes—contagion and lack of nourishment. A sick chicken is like a sick animal or a person, if you please—they need something to build up the tissue torn down by disease. Warm milk and bread, parched grain and all the meat they will eat is none too much for them. In cases of pneumonia, medicine of any kind is little use, the fowl needs warmth and something to keep the fever down.

Some people think they have pneumonia when it is just canker of the throat. In real pneumonia the temperature rises and the bird is very hot—not in just one place, but all over, and if the bird is kept warm and the fever kept down she will get better. A little aconite in the drinking water is a help, but don't force bluestone down a fowl that has pneumonia—it is sure death. Build up your flock by feeding more grain and less pumpkins, and give them a little tincture of iron in the drinking water every day. You will have to keep all other water away or they won't drink it. Put about ten drops to a quart of water and keep it up for a week or two. See that your buildings are free from drafts. Air through a crack in the walls sometimes strikes just one fowl, starts a little running at the nostrils, and that raises a disturbance in the whole flock.

Bubbling at Nostrils.—My chickens are bubbling at the nostrils and eyes, have thick mucus in roof of mouth, but no canker in the throat. Some of them go light. First symptoms are gaping.—Mrs. S. J. F.

Wherever there is gaping it is a sign of canker in the windpipe, though you may not see it. The most humane treatment is to pour a little peroxide of hydrogen down the throat, then hold the hen's head

down until the froth escapes. For the bubbling at nostrils, swollen eyes, etc., take a can of coal oil, then, holding the chicken firmly in one hand, take the head in the right, dip and hold it in the coal oil until it fights for breath, then give it breathing space, and dip again. Wipe off the superfluous oil, give the fowl a Bromo-quinine pill, such as you take yourself, and put it in a coop by itself and feed well. When chickens are treated early it is easy to cure them, but if left to run on several days or weeks it is a difficult job.

Give the whole flock a dose of coal oil in the drinking water. The oil floats on top, and when the chicken goes to drink the oil goes up the nostrils and heals and cleanses them. This is an old-fashioned way of giving coal oil, but I have not found anything modern that beats it. As stated before, the coops, yards, and even drinking and feeding vessels must be scalded, or otherwise cleaned and disinfected before you can get rid of this trouble, because it is likely to break out at any time if the germs are left there. To get rid of it means much more than handing out a bit of physic to a hen or two; it means work. Spade up the ground and clean up everything the chickens touch.

Feeding Young Turkeys.—I have two lots of turkeys, one lot three weeks old, the other five days. Will you please tell me how to feed them after this? Have had good success feeding so far from your directions, and as I do not know anything about young turkeys or chickens must depend on you. Which is best for chickens, clabbered milk or skimmed sweet milk? We put Lee's egg maker in the mash—is that supposed to take the place of beef scrap? We are also putting beet pulp in the mash. Do you know if that is all right?—Mrs. F. C.

The best way to feed young turkeys is to forget to feed them at all half the time. Just let them rustle, and when you do feed do not make any radical change from what you have been feeding. If you have success with the bread, feed them a less quantity and give a little more raw cornmeal mixed with curd and a little cracked wheat mixed in. The idea is to soften the cracked wheat so that it won't swell in the turkeys' craw—but don't overfeed. It is overfeeding that kills young turkeys, and a lack of exercise. Make them get out and rustle. I prefer sweet skimmed milk for chickens—it is clean and does not bake on their heads and combs like sour milk. Beet pulp is all right as a filler—this means if you have no green feed the pulp can be made a substitute. Nothing takes the place of animal food. Fish meal will take the place of beef scrap, but not egg powder.

I trust the good readers of the Pacific Rural Press will not expect me to answer questions by mail. There is not another agricultural paper in the State that gives so much for so little, so please try to send in your inquiries in a way that will benefit others besides the correspondent.

One turkey gobbler is usually mated with 15 turkey hens.

The Bigelow Poultry Ranch, Sonoma, Cal.

WHITE PLYMOUTH ROCKS—Baby Chicks, hatching eggs, from heavy-laying strain of Hogenized layers. The following winners at the California State Poultry Show, Dec. 6-8, 1916, show the quality of my flock: 1st for best egg-type pen; 1st for best exhibition pen, special for best egg-type individual; 2nd and 3rd exhibition pullets and 3rd exhibition cockerel. Mrs. J. B. Tupper, Route A, Ceres, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog, Chas. H. Voden, Box 398, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's, 1000's, hatched right in our \$60,000.00 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Pebbleside Poultry Farm and Hatchery, Sunnyvale, California.

SILVIAN BUTTERCUPS—Best Eastern stock with cock from P. P. I. E. first prize strain. Pure white eggs, \$3.00 per 15; \$5.00 per 30. Fine young cocks, Eastern stock strain, \$3.00. White Wyandottes, Jenkins' strain, \$1.50. Fine young chicks, \$3.00. J. Parnell, Rt. 1, Box 64, Sebastopol, Cal.

WHITE PLYMOUTH ROCK, White Leghorn Incubators, Chicks, Breeding stock. Eggs high class. Scientifically bred. Awarded all first prizes, California State Fair 1916. Make your arrangements for 1917 delivery of chicks. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

HATCHING EGGS—We will sell a limited number of eggs at \$2.00 per setting of 15, from our pen of Hogenized S. C. White Leghorn hens, 4 and 5-finger measurement, mated with magnificent cockerels, 235-egg type. Atterbury Poultry Farms, Rt. 1, Box 183, Turlock, Cal.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorns. \$10 per 100; \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. "Chicks well hatched and half-raised." Will be pleased to send you our circular. San Jose Hatchery, 373 Meridian Road, San Jose, Cal.

THOROUGHBRED WHITE LEGHORN and Rhode Island Red Chicks. Delivery up to June first. Our stock are strong and vigorous, are practically non-setters and heavy winter egg producers. Brooke Farm, Rancho Del Paso, Office 807 J St., Sacramento.

BABY CHICKS—HATCHINGS EGGS—White, Buff, Brown Leghorns, R. I. Reds, Barred Rocks. Sturdy chicks from well-mated fowls. Prompt, efficient service. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

BABY CHICKS—We hatch from our own stock of 10,000 vigorous, healthy S. C. White Leghorn hens of heavy laying strain. Write for price list and further particulars. George Brothers, Petaluma, California.

TUPMAN POULTRY FARM—Panama Pacific Winners. Place your order now for chicks, eggs and breeding stock from our heavy-laying, prize-winning, utility S. C. White Leghorns. Phone OX2, Ceres, Cal.

HOGANIZED AND TESTED—220-egg type White Orpingtons and Buttercups. Hatching eggs, chicks and cockerels for sale. Reasonable prices. For particulars, write M. Woodhams, San Mateo, Cal.

MODEL POULTRY FARM—White Leghorn Specialists. Baby chicks are hatching eggs from heavy-laying stock bred by us for thirteen years. Our prices are right. W. C. Smith, Prop., Corning, Cal.

HATCHING EGGS from our "bred-to-lay" S. C. White Leghorns and Barred Rocks. All hens selected, strong and vigorous. \$8 per 100, or \$1.50 for 15 eggs. Jay Maxwell, Madera, Cal.

HICKS JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" Free.

GIVE the Black Minorcas a trial. Guaranteed first class. Eggs, \$6 per hundred, \$125 per setting. Chicks, \$12 per hundred. Ezra Mosher, Union Station, Napa.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs, Chicks, Stock. Also Rose Comb Reds. Wm. Larm, 5018 29th Ave., Berkeley, Cal.

LASHER'S HATCHERY, PETALUMA.—Write for booklet, "The Day-Old Chick Business" and price list.

PIGEONS—Choice Carneaux, \$1.50 pair. J. W. Noble, Box 513, Livermore.

HOPLAND STOCK FARM, POULTRY DEPT.

White Leghorn and White Plymouth Rock Cockerels. White Leghorns and White Rock Baby Chicks hatched from specially selected heavy-laying stock. Prices same as last season. White Leghorns, January and February delivery, \$12.50 per hundred; March, \$10.50; after April, \$10.00. White Plymouth Rocks, \$15.00 per hundred. All F. O. B. Hopland.

San Francisco Office,

1210 Flood Bldg.

BABY CHICKS—From select free-range White Leghorn stock. Place orders early. Prices on application. Western Hatchery, Petaluma, Cal. W. S. Waldorf, Prop.

"BRED-TO-LAY" White Leghorn Hatching Eggs—Hogenized utility birds. None finer Order now for February and March. Pine Tree Poultry Farm, Los Gatos, Cal.

S. C. RHODE ISLAND REDS—Pullets and Cockerels. One Black Orpington Cock. Eggs from R. I. Reds and Silver Campines. Mrs. B. S. Spaulding, Woodland, Cal.

EGGS FOR HATCHING—Blue Orpingtons, Partridge Rocks, Rose Comb Rhode Island Reds, and Silver-Laced Wyandottes. Tribble Nurseries, Elk Grove, Cal.

"EASTMAN'S BRED-TO-LAY" Barred Plymouth Rocks—Chicks and Eggs. We Hogenize and trapnest. Fairmead Poultry Farm, Fairmead, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 681-687 Brannan St., San Francisco.

BABY CHICKS (White Leghorns)—shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, R. F. D., Sonoma, Cal.

BARRED ROCKS—Grand lot of high-class breeding males and pullets for sale. Satisfaction guaranteed. G. E. Tobin, St. Helena, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. E. W. Stawetski, Route 2, San Jose, Cal.

RHODE ISLAND RED and White Leghorn Eggs and Chicks. Splendid layers, large eggs. Send for circular. Rosedale Ranch, Hayward, Cal.

FOR SALE—White African Guinea Fowl eggs, \$2.50 per 15. Also Houdans: Hens, \$2.25; Eggs, \$2.00 per 15. Mrs. B. Hocking, Guasti, Cal.

BUFF ORPINGTONS—Barred Rocks, Ringlet strain. Eggs \$2. \$3. Runner Duck eggs. \$1.50. Glendale, Fleming Ave., San Jose, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

LARGEST EGG—WHITEST FLESH—Black Minorcas, \$1.50 per setting 15 eggs. Edward A. Hall, R. F. D. 1, Watsonville, Cal.

CHICKENS, DUCKS, GEENSE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal.

THOROUGHBRED WHITE PLYMOUTH ROCK—Eggs, \$1.25 per setting, prepaid. H. G. Nickel, Dinuba, Cal.

RHODE ISLAND REDS—Eggs, \$1.00 for 15. P. M. Cox, Sonoma, Cal.

TURKEYS, DUCKS, AND GEENSE.

MAMMOTH BRONZE TURKEYS—We are now booking orders for Eggs. Guaranteed Eastern Strains of rapid maturity. 1st-prize winners at 1916 State Fair and P. P. I. E. Correspondence solicited. John G. Mee, St. Helena, Cal.

THOROUGHBRED French Rouen Duck Eggs for hatching from winners at San Jose, Oakland and Arizona shows. Also Bourbon Red Turkey eggs. Mrs. Emma W. Miller, Farmington, Cal.

WANTED TURKEYS—Bourbon Red and White Holland females. Send details immediately. Mrs. B. Hocking, Guasti, Cal.

BRONZE TURKEYS—Young Toms for sale. No more eggs till further notice. Free circulars. Albert M. Hart, Clements, Cal.

COLORED MUSCOVY DUCKS—Quiet, quackless. Weigh up to 10 lbs. Good layers. Eggs, \$1.00 for 12. P. M. Cox, Sonoma, Cal.

MAMMOTH BRONZE TURKEYS and Eggs. Booking egg orders now for early Spring delivery. M. M. Gelman, Placenda, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

PROPER GRADING AND PACKING OF EGGS.

The following rules have been adopted to govern the official grading of the product of members of the Poultry Producers of Central California, Incorporated:

Cleanliness.—Avoid washing eggs as much as possible. Keep nests, houses and yards scrupulously clean. Use litter freely. Change nesting material often.

Quality.—In grading and packing, the most important thing to be considered is quality. Eggs should be gathered once a day at least. On hot days they should be gathered twice. Unless you breed for hatching, do not keep any male birds with the hens, as fertilized eggs, unless properly cared for, deteriorate so rapidly as to injure the grade in quality.

Washed Eggs.—All eggs shall be sound, sweet and full, whether washed or unwashed. Washed eggs must be packed separately and marked "Washed Eggs."

Color and Size.—The color shall be entirely white, and reasonably clean. The size, reasonably uniform.

Weight.—Extra eggs must weigh not less than 22 ounces and average 24 ounces per dozen. Select pullet eggs must weigh 20 ounces per dozen and contain none under 19 ounces per dozen. Pee Wee eggs are all eggs weighing less than 19 ounces per dozen. Any eggs that do not comply with above grades must be sold for what they will bring. Therefore it is highly important for every member to keep up the grade and take good care of his eggs. All eggs must be delivered twice per week, and on the days designated for shipment.

Eggs shrink and lose in weight

NORWALK "High Pressure" TIRES

The rugged super-toughness of Norwalks renders them as suitable for country as for city driving. Norwalks insure your safety of arrival without delay. Their perfect service is absolute. 7500 Miles Guaranteed—Ford Sizes 6000 Miles Guaranteed—Larger Sizes

every day. The egg that just tips the scale when grading will, if kept several days, contract so much that the standard weight established by the Corporation will be seriously diminished. Past experience has taught us that these rules must be complied with to assure any measure of success by the Corporation.

Your eggs will be received and inspected by your own men, so you may rest assured that there will be no substitution or juggling in any manner.

INCUBATION OF DUCK EGGS.

To the Editor: I have a Cyphers incubator that I have had for several years, but have only used it twice and it is in good condition. I put duck eggs in it last year and they did not come out well at all. Now, I don't know much about hatching duck eggs in an incubator. Will you give me some information on the subject? How much moisture, air, etc., while hatching in the incubator?—F. P. C., Sunnyvale.

[Answered by Mrs. Susan Swaysgood, Pomona.]

In hatching duck eggs it is very necessary that your incubator be well cleaned out before the eggs are put in. Wash or spray with creolin and wafer one teaspoonful to a quart, then close up doors and heat up.

Start the eggs at 102, for one week, then run up to 102½ for two weeks, and run at 103 the fourth week. The eggs must be aired much longer than hen eggs, but you will have to use your own judgment as I do not know how warm your incubator room is. Air and roll them twice a day, and after the second week sprinkle with warm water every other day until the last three days, then sprinkle every day and let the water be quite warm.

Sometimes ducklings have to be helped out of shell, so at hatching time you need to watch them and help all out that appear to be stuck.

CHANGING MALE BIRDS.

To the Editor: How many days after I change my roosters can I use eggs for setting, and how many Rhode Island Red roosters do I need for 75 hens?—D. S., Marysville.

[Answered by Geo. H. Croley.]

It requires more or less time after changing roosters to be sure that the eggs are fertilized by the new male bird. When the hens are laying few eggs it usually requires a longer period of time, but during the heavy laying in the spring it is usually considered safe to save the eggs after a period of two weeks. To obtain strong fertile eggs we would recommend seven or eight roosters to 75 hens.

INDIAN GAME ROOSTER WANTED.

To the Editor: Will you kindly inform me where I can get a thoroughbred Indian Game rooster?—E. M., Edgemont.

We believe you will receive satisfactory information if you correspond with B. P. Lausten, Palo Alto, Cal. These are no longer called "Indian Game," but are now known as "Dark Cornish" fowls.

Black Minorca chicks cannot withstand dampness as well as most other breeds. Keep them out of the rain.

Furniture Fashion Show.

My Dear Friends: This last week was held the furniture fashion show and all the shops had elaborately decorated windows and invited inspection with no obligation to buy. Several displays of correctly furnished rooms were shown, while another shop devoted most of its space to antiques. Beautiful old tapestries and copies of famous art pieces were shown too.

Emphasis is being laid on decorating the home as a frame for its inhabitants. It is true that many homes are a reflection of the taste of many people, with the result that they do not convey the individuality of one dominating force.

It is not a matter of money but of taste that makes a home. According to a lecture that one shop invited its patrons to, the proportion of a room, its height, width and length must be considered in furnishing it and decorating it correctly. Most of our homes have too many things in them and the first step toward decorating is to see what we could remove so that the objects left would be appropriate and appreciated.

In the rooms portrayed, there was always a definite color scheme worked out. One dining room had a green rug on the floor, the center being plain green with a border twelve inches wide of two darker shades of green. The table was round oblong and not pedestal. The chairs were dark, like the table, but the backs were lightened by stained cane inserts. The walls were the same green as the center of the rug and the woodwork was dark. On a narrow sewing table stood a pair of china lamps with soft green ruffled shades (quite a novelty here). There was a dark sideboard also, quiet in design, and the draperies at the door were of a soft mixture in dark green. The room was set off by a bowl of marigolds on the table. If you have a dark room add a note of color with the now fashionable marigold. It is remarkable how they seem to light up a room.

Did you know that the sunset colors are the ones we choose for our living rooms because they come with the parting day and remind us of rest and home and quiet? A living room wants to be comfortable and warm and cheery without being "cluttery." Putting the davenport before the fire, backed by the library table, on which is a lamp, is a very popular way now of arranging a living room. It economizes space and directs the center of the family life around the hearthstone.

Lamps are still very popular, the silk shade leading in favor. The pedestals universally seem to be bright—at least bright in comparison to the shades. For the shades, you see mixtures. Persian designs or silk in a plain color ornamented with Chinese motifs.

Window-boxes are shown in wicker or to match other furniture and filled with flowering bulbs instead of the conventional fern. That is an idea that many of us could adopt to freshen our rooms this spring.

The mirror is ever popular. Now it is used over a narrow table in the hall and may very modishly reflect a single candlestick or a bowl with

sprays of fruit blossoms or other spring flowers. Any mirror with a simple old-fashioned frame is in the height of style now.

Rosabella Best.

WEATHER-VANE.

Weather-vane, weather-vane, shining and bright,
Standing so proudly aloft on your height,
With your wide arms opened out to the air,
This is the message we sing to you there:—

Turn to the North, turn to the South,
Turn to the East or West;
The wind that blows is the wind of God,
He knoweth which wind is best.

Weather-vane, weather-vane, gay in the sun,
Fair is the morn and your work is begun;
But you must stand there in blue skies or gray,
Faithful to duty, foretelling the day.

Weather-vane, weather-vane, pointing so true,
Bearing so bravely your quill in the blue;
Snows they will fall, and rains they will beat,
But after the storm sunshine's ever more sweet.

Weather-vane, weather-vane, we shall grow old,
Years will rob you of your glittering gold;
But aging together we'll vow to the end
No stress of life's weather our metal shall bend.

Turn to the North, turn to the South,
Turn to the East or West;
The wind that blows is the wind of God,
He knoweth which wind is best.

—Kate Douglas Wiggin.

THE LITTLE DETAILS.

Every woman likes to appear well when she goes out to meet her friends, and attention to small details may be the making or marring of a costume. To see ourselves as others see us is the only sure test, and to do that, there must either be a full-length mirror in the bedroom or hall. If that is not possible, a small rectangular mirror can be propped against the mop board to show one distinctly the hang of the skirt and the condition of the shoes. The well-dressed woman must be as suitably garbed for shoes as she is for hat.

ORNAMENTAL FROSTING.

Whites of 4 medium-sized eggs. Break into tin pan and beat very stiff with heavy wire spoon; 2 cups cane sugar, 1 cup water hot or cold. As soon as it boils up well pour into beaten whites by spoonfuls at first, continuing to cook syrup. Add 1 teaspoon vanilla (scant), and 1 teaspoon lemon juice (full). Place pan over kettle of hot water and continue to cook, beating steadily until it grains on bottom and begins to leave side of pan in beating.

Do all beating in the same direction, turning the pan. Do not stir, but beat. If desired to have the frosting of different colors, divide it and color each part to suit the taste. Harmless pastes can be bought for

that purpose in all colors. When ready to frost the cake, make a pastry tube of a roll of heavy white paper in cornucopia shape and cut the lower edge. Into this put the colored icing (have a separate tube for each color) and after the cake has one coating of the plain frosting, apply the colors by squeezing them through the tube. With a little practice, very pretty effects may be obtained and for special occasions, an air of festivity surrounds even an ordinary cake that is attractively frosted.

ELECTRIC COOKER.

Editor Home Circle: Will you please tell me something about the electric fireless cooker, as I do not see it advertised? —Mrs. D. L. T., Hemet.

The electric cooker is similar in its style to the other cookers, but it has an electric connection that makes it unnecessary to heat the articles to be cooked on the stove. You place the food in the receptacles and then turn on the electric current and the cooking begins. When the food gets to a certain temperature, the current is automatically shut off. One of the very desirable features of this cooker is that you can purchase an electric clock that will start your dinner cooking, even though you may not be at home. This clock must be connected with the cooker and set for the time you wish cooking to commence and promptly on time, the cooking will begin. This enables one to start a dinner at just the time necessary and take up the food piping hot. Electric cookers are priced at \$28 up to \$65. Nathan-Dohrmann Co., and electric supply houses of San Francisco sell them.

SPICED DRIED PEACHES.

[Contributed by Mrs. M. H. W. Fowler]
At the ratio of 3 pounds dried fruit, peel as directed in these columns some weeks ago, and cook only until tender and set aside. Take 1 quart vinegar, 4 lbs. of sugar, bring to boil. Spice to taste and add fruit and let boil up well and it is done. For all kinds of spiced fruits, the proportions are 1 quart vinegar, 3 or 4 lbs. sugar (depending on sugar contents of fruit), 8 lbs. of fruit and spices.

CARROTS AND CANNED PEAS.

Canned peas are much improved if they are well rinsed before serving, and combining them with carrots gives them almost the freshness of green peas. Cut the carrots into small dice and cook in salted water until tender. Drain well and make a good white sauce of butter, flour and milk, to which add the carrots and the well-rinsed can of peas. Season well and you will have not only a generous dish but one the family will enjoy.

Good scales should be part of the equipment of every kitchen.

If there is only one clock in the house, it should be on the kitchen shelf.

Good Health.

[By H. E. Pastor, M. D.]

Rubber Toys and Nursing Nipples.

Rubber toys are very popular nowadays. They will stand all sorts of rough handling without breaking, and cannot hurt children should they fall on them or hit each other with them. Many of these toys, nevertheless, possess drawbacks. The rubber used in their manufacture is a substance of uncertain chemical composition, the simplest type of vulcanized rubber being obtained by heating a mixture of pure gum (caoutchouc) and sulphur. But various metallic oxides of lead and of zinc and of iron, and also sulphide of antimony, are apt to be introduced into the composition to impart desirable characteristics. Some of these ingredients are more or less poisonous, and it behooves those in charge of children to have a care that the rubber nipples and teething rings used be of the best quality only; also, that rubber toys, usually made of inferior grades of rubber, or of so-called "recovered" rubber or "shoddy," are not allowed to be sucked or chewed by children, which they are prone to do after tiring of playing with them as toys. A case of the kind came under the observation of this writer about a year ago. A little girl about 5 years old was observed by her mother to become suddenly deathly sick. When this writer's attention was called to the case the child still had one leg of a little rubber dog in its mouth, which was, of course, ordered taken away. A mild case of gastro-enteritis followed. The trouble may have arisen from the sulphur swallowed, or some compound not easily identified.

The ideal nursing nipple should be free from antimony, lead, or arsenic in any form, should be stiff enough not to collapse easily, should be simply curved in its outlines, have a perfectly smooth interior surface, and capable of being turned inside out for cleansing purposes. A good grade of black rubber is most likely to be free from the toxic substances above mentioned.

The Dose of Castor Oil.

There are some people, especially young people, who can't take a dose of castor oil as easily as an ice cream soda, and who make so many faces at the unoffending oil that it takes a day or two to get the wrinkles out. Now, the castor oil can't help its bad taste any more than a homely girl can help her lack of good looks, or some boys their stock of innate cussedness. They all just grew that way, perhaps. However that may be, you can cover up the bad taste of the castor oil by putting the dose in hot milk flavored with salt and a sprinkle of black pepper. Another good way is to add lemon juice. The milk scheme disguises the taste better, though the lemon juice is more serviceable in helping the stomach tolerate the oil.

Cooling Water on the Farm.

It often happens in the country that cold water is needed in the sick-room for bathing or drinking purposes when ice is not obtainable. A tolerably simple means of reducing the water's temperature is to place it in a common pitcher, wrapping

around this pitcher a towel which has been previously saturated in a solution of nitrate of ammonia (two ounces to the pint of water). This has considerable refrigerating power, and in from thirty minutes to an hour the water in the pitcher will be found to have undergone a decided reduction in temperature.

Notes.

A saturated solution of Epsom salts (sulphate of magnesia) applied to linen fabric stained by iodine, is said to entirely eradicate the stain.

Fresh butter milk has been highly recommended as an application for erysipelas in any stage of the disease. It removes the pain and prevents the spread of the infection.

A New, Better and More Satisfactory MAIL ORDER SERVICE

For Everyone Out of Town
Who Wants a More Livable,
BETTER Furnished Home!

We maintain a Personal Service Shopping Bureau especially for the benefit of our out-of-town customers. Every order is given the same attention by our expert shoppers who buy FOR YOU, as though they were buying for themselves. They seek the very best values in our stock FOR YOU. They take advantage of the very best BARGAINS. They give you instructions the greatest possible care.

Write for what you want. We send, in many cases, for your inspection, actual photographs of furniture upon our floors, which we believe will best meet your preferences. We quote you prices of the very best values in our stock. We enable you to secure the very newest products of the very best factories, and at lowest possible cost.

We send drapery samples, wall paper samples, etc. Tell us as nearly as you can what you wish and we will make special effort to meet your demands.

We pay the freight 100 miles and part of the freight for greater distances. Careful packing, prompt shipments.

[By Geo. N. Tyler.]

Spring Garden Work.

I have been planting, this week, violets as described in my last article. I have also been transplanting or rather boxing off asters that were sown three weeks ago. I use a light soil, and put in one inch of rotted manure in the bottom of the flat. I firm this down and fill the flat up even with the top with soil. This is then pressed down and leaves from one-quarter to one-half inch space for watering. I use a dibble, and prick out the small seedlings and plant two inches apart both ways. I make a hole with the dibble or pointed stick, put in the seedling, and work the soil around the roots with the point of the dibble. Never mind the top; when you water it will level the soil, and you should water as soon as you fill a box. Keep shaded for a few days and then give full sun.

Carnations that were put in sand about thirty days ago are now rooted and ready for two-inch pots. Do not let them stay long in the sand after rooting, for they grow spindling.

Pelargoniums that were potted into four-inch pots a month ago are now beginning to make a good growth. Give them lots of air and sun, and a little later a light shading is very beneficial. You can now give them more water, but be sure and not wet the foliage.

Plant gladioli now; sandy soil is best, thoroughly enriched with rotted cow manure. Plant them five or six inches deep and they will not require staking. There have been some wonderful varieties introduced in the last few years, but of the standbys: America is the best light pink; Blanche, white; Brechyleuse, scarlet; also Mrs. Francis King and princess are fine. These are all florist's varieties grown for cut flowers.

I have had a query this week about sow bugs, or wood lice, as they are called, and what to do to get rid of them. The remedy is this: Take some brown sugar and mix with it enough fresh Paris green to thoroughly color it, and sprinkle thinly on the boards on each side of the benches in the evening; if for outside, you can put some on cardboard or on the edge of the walk, and in the morning you will find the wood lice all ready to sweep up from the walks. Repeat this at the end of two or three weeks and you will have no more trouble with them for some time to come.

Do not plant all your gladioli now, but make a planting every two weeks and you will have a succession of bloom all through the summer and fall. Friesias are now blooming freely and require a great deal of water at the root. Do not let them go to seed, but cut off the flowers after they wilt and your bulbs will be much stronger next year.

HELPS IN THE KITCHEN.

A knife rack is a great convenience in a kitchen and should be used instead of piling knives into a drawer with spoons. One can be made by cutting grooves in soft pine wood and hanging against the wall.

A garbage pail can be purchased that has a lid that is raised by pressing a foot lever.

A Bee-Line to Everyone

Straight as the bee flies and quick as though caught by lightning the voice in the telephone carries near and far over this Nation.

This marvelous instrument is the pre-eminent vehicle of speed and speech. Railroads cover the country, but your traveler often must alight with bag and baggage and change trains to get to a given point. Railroads reach cities, towns and villages. The telephone reaches the individual.

The telephone offers continuous passage for the voice and unbroken connections to the uttermost places because it is a united System co-ordinated

to the single idea of serving the entire people of this country.

It has been a powerful factor, along with the transportation systems, in the magnificent achievements of the United States—helping to prepare the way where latent possibilities of mines, forests and farms were to be developed.

The continued growth of our national prosperity depends in a great measure upon the maintenance and continued growth of the utilities which furnish the means of intercourse and interchange. They are the indispensable servants of the individual, the community and the entire nation.

The Chinese Woolflower

introduced by us last year has proved a great success everywhere and a most wonderful floral novelty. It is a Colasia of new form and easy growth. Plants throw out scores of branches bearing balls of crimson wool nearly a foot thick. Also many laterals with smaller heads, and fresh green foliage. Flowers form in June but none fade before frost, continuing to expand and glow with its wonderful crimson-scarlet color, very showy and succeeds anywhere.

Seed per pkt. 10c., 3 for 25c., together with new TRAILING PETUNIA and ANNUAL SWEET WILLIAM (fine novelties) free. Our Big Catalog of Flower and Veg. Seeds, Bulbs, Plants and rare new Fruits free. Write for it. JOHN LEWIS CHILDS, Inc., Floral Park, N. Y.

If your dealer can't supply you, you will be sent postpaid for 50c; 3 traps, \$1.00. Circular free. A. SALOF & CO., 3914C 39th Ave., Oakland, Cal.

Indoor Closet

More Comfortable, Healthful, Convenient

Eliminates the out-door privy, open vault and cess-pool, which are breeding places for germs. Have a warm, sanitary, odorless toilet right in your house. No going out in cold weather. A boon to invalids. Endorsed by State Boards of Health.

ABSOLUTELY ODORLESS

Put It Anywhere In The House. The germs are killed by a chemical process in water in the container, which you empty once a month. Absolutely no odor. No more trouble to empty than ashes. Closet absolutely guaranteed. Write for full description and price. ROWE SANITARY MFG CO. 278B ROWE BLDG., DETROIT, MICH. Ask about the Ro-San Washstand—Hot and Cold Running Water Without Plumbing.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturers, 146 North Street, Adams, N. Y., and he will send you a free trial package; also color card and full information showing you how you can save a good many dollars. Write today.

SAN FRANCISCO.

San Francisco, Feb. 21, 1917.

WHEAT.

The only happening in wheat was the arrival of 32,000 cents of Australian wheat; but, as this went directly into the hands of the millers at a price above quotations for local grain, it had no effect on the market. The storm has made futures a little easier; but with practically no transactions, quotations are unchanged.

BEANS.

The shipping demand for beans continues; and this, with the local demand, has led to still further advances. Limas are very scarce and bring as high as \$10.50 for the best. Considerable lots of damaged stock are available in large and small whites; and the range shown in the quotations is due to this fact. Pinks, large whites and blackeyes have moved up several times during the week; and lines which have not advanced this week are likely to do so at any time.

HAY.

Everything in the hay line has gone up this week, practically all of the advances having been made before the rains set in. The general idea is that the present rains and the assurance of more abundant feed and a good crop later on, will lead to the releasing of a considerable quantity of hay which farmers have so far held for emergencies. Shipping facilities have been improved; and, so far as can be learned, cars are now being promptly provided. Nevertheless shipments fell off during the week to a little over 1600 tons. This should be largely increased during the next few weeks as pasturage improves with the rains. The advances for the week range from \$1 to \$2, the latter being the advance made by alfalfa. Even straw participated in the upward move.

BUTTER.

Receipts of butter have been of good volume, and the tendency toward lower prices has continued, though with some fluctuations during the week. The shipping movement is not so marked as it was some time ago, the movement to the East having been altogether checked. A certain movement to the north is continued, and the export business continues about up to the usual volume. A fairly steady market is looked for with gradually dropping prices.

EGGS.

The egg market, though still fairly well maintained, is expected to weaken from now on. The tendency to lower prices in the Eastern markets has checked the movement from here to Eastern points with no prospect of an immediate resumption except at lower prices. There is still some speculative movement, however, but not of sufficient volume to have much effect. In the meantime, receipts are increasing daily and a dropping market is to be expected.

CHEESE.

The feature of the cheese market is the continued Eastern movement. Ex-

Produce Market High; Plantings Increased.

The sky-high prices of vegetables for immediate consumption and for canning are leading to the planting of great new areas. Some of the biggest hop companies are replacing hops with vegetables on account of the probability of national prohibition. Destruction of most of the Florida vegetable crop by frost about the last of January has little effect on the local market but is stimulating Eastern shipments. Very few Florida vegetables normally reach San Francisco in ton lots except tomatoes. Onions have made the most sensational advances, with potatoes not far behind. One dealer says there are not over 100 cars of onions on the Pacific Coast. That is enough for two weeks, but there are two months yet to provide for, after which Early Reds will be coming. Some onion sets have already been planted in the Delta. A thousand 100-pound crates of poor quality were recently received from Japan, which sold at slightly above the \$12.50 price now asked by the wholesale trade. A shipment of 15,000 or 20,000 crates is to arrive from Australia within a month and these are of equal quality to any we have. As they can be laid down in San Francisco at 4 to 4½ cents per pound, onions are not likely to advance any more this season, especially since high prices have curtailed consumption. George Shima, the Delta potato king, held his potatoes through the sensational advance and is now selling at \$4.50 or better per cwt. But most of the growers sold early, allowing dealers to reap the profits of the rise. Since the high prices are country wide, shipments have been going east and southeast from the coast and inter-mountain regions. A Colorado grower sold four carloads of potatoes in mid-February to Kansas City at \$4.10. None can be brought in to reduce prices; and it is expected that they will easily go to 5 or 6 cents before new potatoes come from the South after the middle of April. There is a heavy demand for seed potatoes in spite of high prices, and the acreage planned is probably above normal. The supply of good seed is very limited, and large quantities of "marbles" are being planted. Beans also are almost out of sight and this is stimulating planting of all kinds both along the rivers and in southern coast counties. Seed beans have been selling at 8 cents for pinks and 11 cents for small whites. Small fortunes were made by individual growers with beans the past season. Cabbage is already going north as far as British Columbia in quantities. What comes to San Francisco is worth 2½ to 3 cents per pound, higher than for years. We have noted several new extensive cabbage plantings in Southern California, one grower having 500,000 plants out. Wisconsin cabbage has already all been contracted. Contracts for tomatoes have been sought at \$10 per ton f. o. b. San Francisco for canning and \$9 per ton at Sacramento including use of crates. Imperial and Coachella Valleys had plants in the field some weeks ago, and San Joaquin growers were transplanting to cold frames. Large new acreages have been contracted and some new canneries are to be erected, notably in Alameda and Sacramento counties. Last year some canneries started contracting tomatoes at \$7 and finished at \$12. All of the prospective pack for 1917 has already been sold by the canners; and the same is nearly true of asparagus, of which a great acreage is being planted in the Delta this year in addition to the 32,000 acres already there. The asparagus is contracted mostly for eastern shipment at 10 to 14 cents per pound up to a certain date, when the rest is to go to the canneries, whose capacity has been and is to be greatly increased. Spinach has been contracted at \$25 per ton in the Sacramento district. Imperial Valley lettuce has been shipped a month in carlots at the highest prices in history up to \$2.75 per crate. This goes east. Small quantities of local cabbage, cauliflower, lettuce, celery, etc., have been coming into Los Angeles and San Francisco markets at high prices, and the rain will help supply plenty of all vegetables with the warm weather coming.

Vegetable growers made more money last year than ever before, because many of them warehoused their own stock and took advantage of the rise in prices; and now they hesitate about contracting ahead even for the canneries. Good prices are expected in most lines, because of the present shortage, the early sales of the canned pack, and the increased capacity of canneries.

ports also keeping up well. Notwithstanding further advances this week, it is understood that further Eastern orders have been placed. The local demand is firm.

Pears, Winter Nellis2.50@3.00

DRIED FRUITS.

The dried fruit market has been dull this week, this being especially true of spot stocks which are scarce in most lines. A lot of interest is being taken in 1917 crops; but, as a matter of fact the actual transactions appear to be small and of a purely speculative character. The uncertainty of the international situation and the railroad embargo, have had a bad effect on future buying. Very small sales of 1917 prunes at a 4½-cent basis have been made and there have also been some sales of future peaches at 6 cents. The situation continues favorable for high prices for the coming crop of raisins.

LOS ANGELES.

Los Angeles, Feb. 20, 1917.

BUTTER.

Receipts of week ending Feb. 20, 1917—325,668.

Receipts of week ending Feb. 20, 1916—345,559.

The market the past week was without feature. Receipts were better than for some time but as there was a good consumptive demand and the Eastern markets held steady and no cold storage stocks, there was no disposition to break prices. It was a 37c market throughout the week up to Tuesday and but little trading on call. Chicago was unchanged throughout the week and so was New York. Tuesday brought no change. Receipts were light, but as it was raining and the outlook is for better production, there was no disposition to sell the market off.

EGGS.

Receipts (railroads) for week ending Feb. 20, 1917—3018 cases.

Receipts (railroads) for week ending Feb. 20, 1916—2827 cases.

A steady and very good market was had the past week. Receipts continue to improve, but under the influence of a good consumptive demand prices ruled steady throughout the week. The Eastern markets also held up very well, which had a sympathetic influence. This with the want of cold storage stocks enabled receivers to maintain a steady market in the face of better receipts. While prices are lower than last week, yet they are 10½c higher than this time last year. Tuesday saw a general decline. Good receipts and San Francisco being off ½c and the home demand not so strong as the previous days of the week caused buyers on call to hold back and buy sparingly. But few sales were made and they showed a decline of 1½@2c.

Turkeys, heavy, 12 lbs. and up.29@30c

Citrus Tendency Higher; Picking Stopped.

Exchange quotations on citrus fruits for San Francisco were withdrawn Feb. 20 until further notice on account of the rains which stopped picking. The tendency of the market at that time was higher, having been boosted 35 cents a box within 10 days on account of Florida damage; and it is likely the new prices will be advanced when picking begins. The market is considerably higher than a year ago.

The Los Angeles folks who complained that they could not get good oranges were simply unwilling to go after them and pay the price. That market has been so long flooded with culls that "Sunkist" quality seemed too expensive, though that brand has always been available. Since the dealers got together and showed the Exchange that they were willing to pay for quality, the Exchange has put in a man to work that market as they do other cities.

Turkeys, light24@25c
Squabs, live, per doz.\$1.50@3.00

CABBAGE AND CAULIFLOWER.
Offerings of cabbage the past week were light and demand good. The falling off in the receipts caused buyers to bid up a little stronger, sales generally being made at an advance of \$5.00 per ton. Prevailing prices \$4.00@4.50 per cwt. Cauliflower as well as cabbage sold a little higher during the week. But little coming in. The season fast drawing to a close. Selling at \$1.30@1.40 per standard crate.

WALNUTS.
The main crop has not only been marketed for some weeks but most of the culls are now in. Speaking of culls, the Southern California Walnut Growers' Association, which has heretofore confined itself to graded walnuts, is handling culls this season. They take them and crack them and put the meat in boxes and after being graded it is sold. They have in this way been netting the growers 2c per pound more than they have been getting from outside buyers heretofore. Independent buyers have been buying culls at 3@4c per pound.

Special Citrus Market Report.

Los Angeles, Feb. 20, 1917.

Shipments of citrus fruits from Southern California from November 1 to February 15: Oranges 7,044 cars and lemons 1,533 cars. Same time last year, oranges 6,387 cars and lemons 1,637 cars.

Shipments from Central California from November 1 to February 14: Oranges 4,013 cars and lemons 150 cars. Same time last year: Oranges 4,172 cars and lemons 129 cars. The markets East continue to hold up fairly well. Shipments not heavy and the trade taking care of the arrivals without trouble. Larger sizes were a little draggy and weak, but popular sizes of all well known brands held up very well. Lemons firm and meeting good demand. Locally the market has assumed a better tone. Local packers are inclined to buy a little more freely and paid a little more money for all choice fruit. Oranges coming in a little sweeter which is causing freer consumption. Local packers are bidding

for the best highly colored oranges 1@1½c per pound in the grove picked. Grapefruit steady and rather firm at 2@2½c per pound in the grove picked. Tangerines still slow sale at 1@2c per pound in the grove picked. Lemons steady at 1@1½c per pound in the grove picked for the best. Poor have to go for less and very dull.

AUCTION SALES.

New York, Feb. 16.—Sixteen cars navel and three cars lemons sold. Market lower on navels, especially the larger sizes. Lemons very strong. Weather cloudy. California navels averaged \$2.10@3.30; lemons \$3.25@3.50.

Boston, Feb. 16.—Six cars sold. Market doing better on oranges and lemons. California navels averaged \$1.80@3.30; lemons \$3.25.

Philadelphia, Feb. 16.—Three cars sold. Market strong and higher on oranges. California navels averaged \$2.10@2.65.

Special Livestock Market Report.

San Francisco, Feb. 21, 1917.

The livestock market is very quiet, though all classes of hogs are marked up and mature sheep also.

CATTLE are scarce in the West, though much stuff in poor shape would have had to be dumped somewhere to the demoralization of the markets, had not the rain promised feed. Now, growers generally will hold until stock is in better shape to market and it will be better for all concerned; though shipments may be a month later than they would if the winter had been normal. The present condition may not raise prices immediately, because consumption has fallen off.

Steers, No. 19½@9½c

WOOL is interesting. Sheepmen of upper Sacramento Valley are selling

next spring's year-clip on back at 38 to 39 cents, nearly 100 per cent increase since last spring. Kern county wools mostly sold around 23 to 25 cents for spring clip. Mendocino wools are not moving yet.

Los Angeles.

CATTLE: A firm and fairly good market was had the past week for all good killing cattle. The Eastern markets continue to hold up and a very good demand was had for beef, which encouraged buyers. Hence the advance of last week was fully sustained. Killers were all in the market and wanted supplies. California and Arizona continue to furnish most of the supply.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$9.00@9.50
Prime cows and heifers7.50@8.00
Good cows and heifers7.00@7.50

HOGS: There was a further and sharp advance in this market the past week. Receipts not so heavy, while the demand held up very well under the influence of a good demand for

fresh pork. The Eastern markets also continue high, which had its influence. California and Arizona furnished most of the supply and some very good hogs. But few Idaho hogs in, most of them continue to be drawn East by the high prices there.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.\$9.75@10.25
Mixed, 200@250 lbs.10.25@11.25
Light, 175@200 lbs.10.25@11.25
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: A good and strong market was had the past week. Not many coming in. Killers were all in the market and wanted both sheep and lambs and last week's advance was fully sustained. Owners in the country still inclined to hold most of their sheep and lambs until after the lambing and shearing seasons are over. Utah and Idaho continue to furnish most of the supply.

Per cwt. f. o. b. Los Angeles:
Prime wethers\$9.00@10.00
Prime ewes9.50@10.00
Yearlings9.50@10.00
Lambs13.00@14.00

CALVES: More coming in and market hardly so active. Still the demand the past week was fair and old prices were sustained. Selling at \$8.75@9.75.

North Portland, Or., Feb. 19, 1917.

CATTLE: There was but a moderate run of cattle received for today's market, about 600 head, the quality of which was the best received here for many months. There was an excellent demand. Prices in all good beefs was advanced 15 to 35 cents higher. One load of prime medium-weight steers brought \$9.60 while the bulk of the beef steers sold from \$9.25 to 9.50, the supply was quickly disposed of. All good heavy cows were readily disposed of at \$8.00 with the fair to good kinds at \$7.50 to 7.55; common valley cows sold down to \$5.00. The heavy demand for bulls at this market continues and prime heavy bolognas advanced another 25 to 50 cents, one prime heavy bull bringing \$7.00 with a number of others at \$6.50 to 6.75. Fairly good bulls sold at \$6.00 to 6.25 with a few extremely light ones down to \$5.00. There were a number of loads of good feeding steers here which received a very good call to fill the short feed lots; several loads of 900 to 975 pound steers brought \$8.25.

HOGS: The hog market was rather irregular today, prices on all good hogs ranging from 10 to 25c higher than Saturday. The early sales were the highest of the day, four loads bringing \$12.60; the later trading was on a considerably lower basis, the bulk of good heavy hogs bringing from \$12.05 to 12.35. Pigs were in light supply and realized only steady prices, the bulk of good pigs bringing \$11.00 to 11.25.

SHEEP: Sheep market was firm with a fairly good demand, offerings were moderate, several loads of prime east of the mountain lambs sold from \$11.00 to 12.50. There were no shorn lambs in the trade but were quoted at \$10.50 to 10.75, one load of shorn yearlings sold at \$9.75 with a load of good ewes at \$9.25.

Publisher's Department.

We are still receiving orders for "California Vegetables," which we are unable to fill. Maybe your book seller has a copy. Do not send us your orders as we can not help you till the fourth edition is published next September.

Our field force are again at work and the subscription list is growing at a gratifying rate. During the past seven weeks we have added 1360 new paid subscribers to our list—we expect to increase this number as the weeks pass, on account of prospects from the good rains.

The Killefer Mfg. Co., Los Angeles, have just received from Algona Bay, South Africa, an order for immediate shipment for one Laverne Rotary Cultivator, one Killefer Orchard Disc and one Clean Cut Weeder and Mulcher. The Port Elizabeth Agricultural Show is to be held on March 20th and they ask that these tools be shipped so they will reach there in time to exhibit.

COST LESS

Even though Racine Horse Shoe Tires sell for considerably less than other tires of comparatively the same high quality, they are guaranteed for 5000 miles.

Note the unique tread. The anti-skid horse shoe cups are sunk into the tread—not elevated. When the cups eventually wear smooth there remains a thickness equal to a plain-tread tire.

It's making a great hit in the country because it's giving ranchers the right kind of service. Your dealer can supply you—if not, write us; it will pay you.

About Baby Chicks' Health^{and} Growth and your PROFITS

Sperry Gritless Baby Chick Feed contains the food values and constituents which Nature has taught the mother to scratch for her chicks.

That's why thousands of chicken raisers are enthusiastically feeding it. They know that to make money in the chicken business they must save a big percentage of each hatch. They have proved that chicks fed from the outset on Sperry Baby Chick Feed (packed only in yellow striped sacks) live, thrive and develop into healthy, strong chickens.

Information about the feeding and care of your baby chicks and many dollar making pointers are given in our booklet, "Makes Hens Happy." Get your copy by writing your name on the coupon and mailing it today. It's FREE.

Sperry Poultry Foods are made in a Special Mill at Stockton by the Sperry Flour Co.

Range Requirements for a Comfortable Living.

[Written for Pacific Rural Press.]

MOUNTAIN and hill range conditions vary to such an extent in California that it is almost impossible to formulate any specific rules that will apply to all conditions; but it is the consensus of opinion among cattle raisers that some hill or mountain area is essential in the economical production of beef, some growers even claiming that some range is absolutely necessary in their districts.

On this subject H. H. Gable, owner of the Diamond G Ranch in Yolo county, states that in his opinion some range is desirable for economical production, as valley land might easily be too valuable for beef growing purposes. Further, if valley land is used, it would be necessary to keep the cattle up and feed them in the winter to prevent the tramping of land. That would add considerable to the cost of production.

F. G. Stevenot of Carson Hill, Calaveras county, does not think mountain range is absolutely necessary, but thinks it is well for stock to have green pasture of some kind in the summer time if they have calves at foot. Chas. Pomtag, of San Benito county, thinks cattle can be run without ranges, but Geo. Watterson of Inyo county states that they are necessary in his part of the country.

Cattle per 100 Acres.—Probably nothing is more difficult to define than the average number of cattle that may be carried on each 100 acres of mountain range. On this point Mr. Stevenot states that it all depends upon the character of the land and the section of the State and that even that can be sub-divided down to local conditions. Over most of the range of the State that is worth calling "cattle range," it runs from eight to thirty acres for each animal.

Mr. Pomtag, Mr. Watterson, and Mr. Gable also state that it is purely dependent upon the local conditions, but Mr. Gable says that it is the experience of most cattlemen that on ordinary range, for cattle to do well the year round, there should be figured not more than one head to every 15 acres. This is on the assumption that one head of stock may be either a yearling, two-year-old, or breeding animal.

Cows to Yield \$4,000 per Year.—There are two ways of figuring the smallest practicable herd that may be expected to yield a gross income of \$4,000 a year, according to Mr. Gable.

If it is desirable to keep the herd so as to turn off the produce at two years old, it will be necessary to keep at least 100 breeding cows. If a sufficient number of bulls are kept, say one to every 25 cows, there should be a 90 per cent calf crop. These carried to a selling age, say two years old, will mean a herd of 370 head of all ages. Assuming that the two-year-olds weigh at selling time 1,000 pounds and sell for an average

of five cents a pound or \$50 a head, and allowing for a certain per cent of loss, this number will yield a trifle over \$4,000 per annum.

If it is desired to sell the entire calf crop at weaning age, it will be necessary to keep a herd of about 225 breeding cows. With the same percentage of calf crop as above, the annual turnoff would be about 200

head, which will sell for about \$20 a head. As calves up to weaning time are practically no expense, their number, 90 head, should be deducted from the number in the herd in the first instance, leaving a herd of about 280 head as compared with a herd of 225 in the second instance. Of course these estimates will vary, according to condition of range, market, etc., but Mr. Gable believes them conservative.

Like Mr. Gable, Mr. Stevenot believes that 225 cows are required to secure the \$4,000 annual income, if the turn-off is sold as calves and provided they are grown under favorable conditions. He says that on paper they will do better, but that under actual conditions it will take fully that many. If steers are to be turned off as

three-year-olds it will require a mixed herd of about 450 head. He says he knows of a few who do better than this but the average do not, in fact some fall below. He bases his opinion on calves selling at \$20 and steers at three years old averaging \$70. Very few strictly two-year-old steers are sold in his district. The matter of possible income, thinks Mr. Watterson, depends so much upon kind of stock, method of handling, and age marketed that it is difficult to advise in a general way. Where both two-year-old and three-year-old steers are sold, Mr. Pomtag places the requisite number at 250 to 350 head.

The Herd Bull.—In the above calculations it is supposed that good bulls are to be used for there is no factor that will influence profitable beef production more than the herd sire or sires. This is true equally on both hill and valley lands, for it is a well demonstrated fact that the well-bred grade steer will gain weight more rapidly on a given amount of feed than his inferior bred mate, and this holds true whether he be roaming over poor or abundant feed areas.

How the breeding may effect the gross income of a herd is seen in the operations of a large and successful range operator in northeastern California, who sells his calves at weaning time as alluded to above by Mr. Gable. These calves are sired by purebred bulls and out of highly graded cows, and when sold to a Nevada feeder they

bring right around \$30 a head. Nor are they high-priced at that, for the writer recently saw a bunch of these that averaged better than 1000 pounds as short yearlings. It is needless to say that they topped the market because of their uniformly prime condition.

WHAT SHALL WE DO NOW?

PLENTY of water has fallen everywhere. A week's storm has brought the whole State to normal rainfall or beyond it—except in a few places where the normal exceeds any use that can be made of it. The Weather Bureau table in another column shows how well we are fixed for water for all present purposes. It is possible that we had a tight squeak from a dry year. Perhaps we did escape only by a scratch from the perdition of a stormless winter, and yet it is hard to realize, as we look upon his bright disk this Tuesday morning, that old Helios has been lying-in with the prophets. If he had, his broad, gleaming face ought to be as black as a stove-griddle—considering the storm we have just passed through. But did the prophets merely slip a cog by accident and let this storm through, and was their general direction toward a year of moderate rainfall right? Whether you think that way or not, it is just to act as though you did. In the past we have had to March through dust and through mud, and it will be wise to act as though it might be dry. There is plenty of water in the soil now, and everyone should try to hold on to it. Just as soon as the ground gets fit, start the plows on all land which was allowed to lie hard during the long dry spell. Do not let the orchard and vineyard lie as late as you might if we had had a heavy winter. If you do you may be rustling with the clods most vexatiously and inefficiently later in the spring—having lost most of the water which the upper soil now holds. If you are holding some good land for summer crops, as seems most wise in view of the prospective demand for them, break it up now and harrow to half-fineness, so that you will be sure not to be working and planting in dry soil and much doubt after frost danger is over. Of course March sometimes drops a lot of water, and hillslopes should be treated with wise regard to this, as they always should, but most lands will be able to store away what water they get in March, considering how dry they may be below. The thing to do, therefore, is to hold on to what water you now have and to get in as much more as you can, so that summer growth of fruits and of field crops may come through large and abundant. Don't watch the clouds; don't listen to the prophets; hold fast the sure thing now given you and keep your eyes and hands on the earth!

THE FUSS ABOUT FOODS.

THERE is a terrible fuss being made about the price of foods, and much good will doubtless come of it, because, with public attention concentrated on food problems and much investigation into the handling of it, we shall surely know more than we now do about the production, transportation, and commercial distribution of it, and no doubt righteousness will be advanced by knowledge. We must say, however, that, speaking broadly, there is no such mystery and iniquity about the situation as sensational orators and essayists claim to see in it. As we tried to ex-

plain last week, food distribution is wrongly founded and controlled, and there is only one way out of the dilemma, and that is, by thorough reorganization and readjustment of relations between producers and consumers, which will be a very slow process. Meantime thought among those most interested and investigation by those best qualified will surely work toward readjustment of relations just mentioned, and toward distribution of benefits to those having real claim to them. It is the duty of the producer to maintain sympathetic and appreciative attitude toward the efforts of consumers for fairer treatment and to participate in a movement which is clearly for the advantage of the whole people.

Without commenting upon the country-wide situation in foods, because we really know nothing of the fires which may be really burning beneath the smoke of sensations which is blackening the whole national sky, we must nevertheless hold that our local situation seems to us neither complex nor mysterious. On the contrary, it strikes us as quite simple and natural, as likely to endure but a short time, and therefore State condemnation and distribution of foods, as now proposed to the Legislature, seems likely to be killed during incubation, even if there is among the law-makers any disposition to hatch it out—which must be very doubtful.

WHY PRICES ARE HIGH IN CALIFORNIA.

IT IS not unusual for prices of potatoes and onions to be high in California at this time of the year, and the causes which make them high this year are the same which usually advance them, operating now with unusual severity and stress. These two common and heavy vegetables, for which we have almost unlimited suitable land, have always been subject to wide fluctuations. At times potatoes have more than paid in one crop for the land on which it has been grown; at other times they have hardly paid for the sacks in which they are marketed. At times frugal families have boiled rice because potatoes were too high and restaurants have laid a charge on them, while at other times the restaurateur would throw in with a meat dish a boiled spud as long as a French loaf or a shovelful of fried—whichever you might choose. Onions have acted in the same way, but not to the same extent. This fluctuation in supply, which has caused extremes in value, has been in part natural action and reaction in cropping based upon experience in selling, but always in front of a background of distant shipments, invited or refused.

Whenever production east of the Rocky Mountains has partially failed from some cause, and values there have advanced sufficiently to counterbalance overland freight-cost, or whenever (in former years) the railways would help growers to get something out of a big crop by making a special rate to the Middle West, potatoes and onions have moved out of the State freely and local prices have increased. Whenever no such relief could be realized, prices have made profit in these crops a close question, and growers have had to be circumspect in planting. Last year and this an eastward attraction for our potato surplus arose stronger than usual, through the cutting off of imports from Europe, upon which the eastern side of the country has been long dependent in case of need, and a failure of the Eastern crop of 1916, amounting to about one-third of a normal product, or nearly one hundred million bushels, quite clearly explains why potatoes are high in this State. The relation of California to the Eastern shortage in esculent foods was indicated in a dispatch from Chicago last week as follows:

"The farmers in Michigan, Wisconsin and Minnesota are not holding back potatoes for higher prices. Their supplies are practically exhausted. In former years, when the domestic crop was exhausted, the country bought potatoes from the British Isles. The war prevents that now. The frost in the south has delayed the crops of potatoes, cabbage and onions. We will get no relief until we begin getting in large supplies from California in three or four weeks."

This prophecy of relief from California is based upon two anticipations—the movement from California as the car-famine is remedied, and the conception of California as an early-crop State. Of

the supplies of old crop now stored in this State there are estimated to be about 200 carloads in San Francisco, mostly sold and subject to shipping orders, and about 400 cars in the Stockton region—out of which has to come the large local seed requirements. It is also said that 2000 cars are still to come from Oregon, Washington, and Idaho. On the whole, it seems to us that we shall live through this great stress on potatoes nearly as comfortably as we have survived less stress in the past; and in view of supplies to come, old stock from the north and new crop from our own lands, we would be inclined not to hold potatoes at present prices, for they may be more reasonably expected to recede than to advance.

The wide recognition which California winter-shipped products are now commanding will be of considerable value in the future. The Southern States, even to Florida, have been severely blizzarded this winter, and the dependability of the district is somewhat shaken. We, too, have lost much tender truck in certain localities, but semi-hardy stuff, like lettuce, onions, potatoes, etc., is coming from the fields now, in considerable quantities, both for local use and Eastward shipment. The East is warranted in looking to California for winter service, and such favor must be largely the measure of our future safety in extension and diversification.

CALIFORNIA PREPARING FOR SERVICE.

FOR months past California growers have been stimulated by good prices and outlook for their special products to prepare for largely increased production. It is to be expected that the acreage of potatoes, onions, beans, and tomatoes will be much greater than usual, and with water now assured, if conserved by proper cultivation, to roll up notable field crops. It surely is the outlook that all such things will bring good prices for there will be no carry-over, and the distractions of the world will continue to demand, at least to the end of everything that can be grown in 1917. But care should be had not to gamble too widely in the year's crop. It is not at all to be expected that prices which are at present verging on famine figures will be continued. It will be enough to realize really profitable values, for anything more than that is very liable to die on the way. Buyers are not out freely offering to contract, and contractors are apt to overdo themselves, for reasons of which some may be apparent and some obscure. It is a good thing for the grower to have a good contract, whether it be with a growers' selling organization, or otherwise. In the latter case it is vastly more important that his contract should be good than that it should name the extreme price. It is better to lose fractions in price than to lose whole numbers because a contractor is wretched or irresponsible. Wild buying and all kinds of ventures are to be expected under the sensational conditions which seem to be now prevalent, and if prices should recede there will be all kinds of holes in contracts disclosed. Look to the responsibility of the contracting buyer and attach due weight to your assurance of that.

BABES IN THE WOODS.

IT IS natural of course that people should be excited by the prices which they now have to pay for onions, potatoes, beans, and other vegetables, and it is perfectly right for them to beat against the bars which have arisen between them and their customary food supplies, but they should try to do it without adding bruised knuckles to gnawing

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., February 27, 1917:

STATIONS	Rainfall Data		Temperature Data	
	Past Week	Seasonal To Date	Normal To Date	Max'm Min'm
Eureka	4.10	21.43	31.31	56 32
Red Bluff	3.58	14.88	17.51	60 36
Sacramento	3.38	11.48	13.86	60 38
San Francisco	2.69	13.97	16.21	60 44
San Jose	3.24	11.34	11.56	60 48
Fresno	.42	6.22	6.43	64 42
Independence
San Luis Obispo	4.24	21.97	13.93	60 46
Los Angeles	1.80	14.34	10.86	64 44
San Diego	.66	8.46	7.06	64 44

machs. This can be done by ascertaining the truth about the causes and conditions which have made high prices possible, and then meeting them by wise productive effort, as has been suggested above. A word, however, should be said about certain frantic cries which are being made for relief efforts which, because of their nature and requirements, can relieve little or nothing, and, even projected as enterprises for profit, can profit nothing. They sound very plausible in the public ear because the public notion of producing food is that it consists of spring-scattering of seed and autumn-gathering of crop, and, therefore, anyone can do it, to the end that he can save money, by making it unnecessary for him to buy, or make money by selling the vast weights of produce he will get in the fall for the prices which he had to pay for the seed in the spring. For the sake of our own conscience we must say that those who are deceived by such visions are not wise. The great ventures which are pictured—by which ones shall farm vacant lots with the municipal payroll for the public benefit—are economic nightmares. The little enterprises—by which owners of vacant lots shall hire labor at city rates to do things which neither employers nor laborers know how to do—are economic day-dreams. The

only undertakings which have any chance of coming through as calculated are those in which men and women, who know how to do it, are able to translate their leisure time into work, paying little or nothing for wages except for team or tractor work in the preliminary plowing. They may, of course, multiply their own powers by using mule or gasoline motors in cultivation if they will themselves dodge the heels of the mule or guide the gasoline, but if they undertake to hire mule or gasoline artists at city prices for the service, their investments will nearly always exceed their receipts from the products. We speak of this because we have so many appeals, by wire and wireless, for pointers from those who wonder if they are not losing the chances of their lives by neglecting backyard investments or enterprises for food production. We do not hear much from those who know the requirements. They either get in or keep out, because they do know the requirements and how to meet them, by doing or not doing, as the case may be. It does not matter much how high prices may be, those who try to break into commercial production without more practical knowledge than their speculative vision prescribes, are almost sure to encounter a submarine.

take care of itself on capri trees unless you get too hard freezing on such low ground. A few caprifigs for shade around your buildings would probably wasp the whole neighborhood.

Callusing Fig Cuttings.

To the Editor: I have fig cuttings and am told to put them in the ground head down until they callus over before planting out in a nursery row. Is this the correct procedure?—J. D. N., Modesto.

It is a very old and successful practice with hard wood cuttings—not only with fig but vine, rose, etc. The formation of callus is nature's way of healing injuries to woody and bony tissue. In the case of woody tissue new cell growth proceeds from the alburnum or growing layer and the growth of new roots proceeds from the same layer—therefore to get a callus is the foundation of rooting the cutting. The activity of the alburnum which results in a callus is due to a requisite amount of heat. By inverting the cutting you bring its lower end nearer to the surface, where there is more heat and (in the rainy season) less danger of too much water; the calluses come more quickly and the cutting is surer to live and grow. Cuttings are tied in bundles for callusing because they are more easily dug out and more likely to keep their tender calluses safe from injury. They should of course be set singly right side up in nursery rows as soon as the callus is formed. It should be added, however, that this rational and successful method is not usually necessary. In free loamy soil, in which water does not stand, most cuttings callus and root well enough if placed at once right side up in nursery rows.

Fig and Grape Partnership.

To the Editor: I have Bartlett pears with alfalfa in between and after battling with the blight unsuccessfully, I plan to take them out next fall and plant figs and grapes. Near me a fig orchard is on the same kind of sandy ground and last year had much cracked fruit. The water comes up to about two feet in summer, but goes down to five or six feet when irrigation stops and stays down all winter. Can I grow figs and grapes for an indefinite period, or must the grapes give way for the figs in 10 years? Would the water being so close cause the figs to crack?—N. D. J., Modesto.

You will have to do your own guessing about what causes figs to crack. Neither cause nor cure have yet been demonstrated. Figs and grapes can be grown together indefinitely. We know that from European experience. But we also know that under California commercial conditions and methods of soil and fruit handling it is better not to clutter up your property with such a combination for very long, and perhaps better still not to do it at all. After a few years of hard work in getting sunshine for the grapes and root room for the figs, you will be trying to sell out a "finely assorted fruit plantation" to a tenderfoot. We would rather let alfalfa drink up the excess of summer water in the fig orchard and give the grapes sky-room by themselves.

Handling Fig Cuttings.

To the Editor: I have pruned Calimyrna fig trees and desire to propagate trees from these prunings or cuttings. I presume the ground is too cold for them now. If so, how can I preserve them and until about when? For the time being I have piled them and covered with damp straw.—H. J. H., Terra Bella.

Damp straw is dangerous. It is likely to heat by fermentation and scald the cuttings or to mold and cause decay. Bury the cuttings in bundles in sandy loam in a place where the water will not collect or put them into boxes of clean sand and keep moist but not wet. It is not, however, necessary to do so as late as this, for if you have well-drained loam you can set them in nursery rows immediately.

Pruning the Feijoa.

To the Editor: What is the proper heading and pruning of the feijoa?—P. W., Corning.

It only needs pruning enough to form a well shaped bush. It takes most readily to a roundish form and should be checked from too much rambling—though, as the fruit comes on the new wood, enough of the newer growth must be carefully provided for. In a garden the plant can be trained to a fence, trellis, etc., but usually shapes itself pretty well with the slight assistance indicated.

By

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Growing Broom Corn.

To the Editor: You recently mentioned a Utah concern contracting for broom corn at \$00.00 a ton. What is the name of the concern? I have a piece of delta land, peat and siltment, and I would like to get in touch with these people in Utah. I have also been approached by some San Francisco parties. I understand a moist soil is required. What is a good average yield on river bottoms? When should it be planted? How far apart should it be rowed and should it be planted in hills or a continuous row? I have been advised there is good feed value in the seed.—A. W., Holt.

We have not the address you want. Probably it can sell just as well in California towns. Utah has fewer sweepers than California and probably has contracted for all required. The price quoted for broom corn applies only to the properly cut, cured and baled brush in shape for the broom maker. The crop is often profitable, but one has to know how to handle it. It is planted at the same time and in the same ways as Indian corn. It is a sorghum and seeds at the top. While still green the tops have to be broken over so the brush can be cut, if it is a tall kind of corn. If a dwarf kind, the brush can be more cheaply gathered by pulling, for it is within reach and it works that way. The brush is taken to a machine for scraping off the seed and it is then cured. Simple cutting and drying will not do. There is quite a trick about making a good crop of broom corn and quite a lot of hand work when you know how to do it. This must be learned before risking the crop. The seed is edible for stock, but not as good as other sorghums and is especially poor when the brush is the product because it must be taken while still green and before the seed fills well. The yield of broom corn in California ranges from 600 to 750 lbs. of merchantable brush per acre—in extreme cases nearly 1000 lbs. If you get a broom corn bee in your bonnet the first thing to do is to send to the U. S. Dept. of Agr., Washington, D. C., for a copy of "Farmer's Bulletin No. 768" and study it carefully so as to understand that the crop costs a lot and that you are not likely to get over-rich at 100 per ton at the prices you have to pay for labor in this State. But, above all, do not monkey with the crop unless you understand all its requirements.

Grain for Fowls.

To the Editor: Which is the best grain for chickens, other than wheat, when to plant, and number of pounds per acre? Milo, Kaffir and Feterita have been recommended.—G. L. C., Fair Oaks.

About the only grain you can sow on upland as late as this is one of the sorghums you mention, all of which will take to the conditions

better than Indian corn. Sow as soon as you get past danger of frost (probably early in May) but go at the land as soon as it gets into shape after this rain, plow and harrow and let it lie. Plow in the green stuff shallow and sow thinly in drills three and a half feet to facilitate cultivation during growth. Plants should stand several inches apart and about six pounds should seed an acre. Preferences between the different sorghum varieties seems to be largely a local or personal question. Put in milo and feterita and see if you can settle the preference for yourself—the latter is a fine large grain and comes to ripe grain sooner. If you expect the cows to take the roughage, they will prefer Kaffir.

Complete Fertilizer Indicated.

To the Editor: I wish to plant potatoes, corn and beans in sandy soil three miles from coast, and want to fertilize. What kind of fertilizer is best to use and what time to apply to get best results?—J. T. S., Berros.

So near the end of the rainy season and so near the planting time when the plants must have the sandy soil without coarse stuff to cause it to dry out, there is only one application you can reasonably make and that is a "complete" commercial fertilizer which dealers can furnish you under that name with the ingredients soluble and proportioned according to the requirements of the plants named, which their formulas are built upon. When you get the crops off early next fall spread and plow in all the barnyard manure you can get hold of at reasonable cost for buying or hauling, and sow peas or vetches to plow under green this time next year, to get ready for your summer crops of 1918.

Fruits for River-Bottom.

To the Editor: I have very rich sandy soil on river bank. During high water this land is flooded for a few days. Most of the year the water in the river is about 8 feet below the land. Do you think this land suitable for figs or would the roots go down to water and cause the figs to sour? If I plant Smyrna fig will I have to get fig wasps every year, or will wasp live in caprifig from year to year? If so what per cent of caprifig would I have to plant? Or do you think I could do better by planting nuts—pecans or walnuts?—L. C. N., Kingsburg.

If your high water comes during the active season of the trees, we should question the suitability of the land for fruits, although there are sometimes local conditions which might make plums and pears safe, and productive, if on the right roots. Pecans would probably delight in the conditions, and walnuts on black walnut roots might take to it all right. It would probably be a bad place for drying figs. The fig insect should

Apples Chiefly Grown in California.

[We receive just in time for presentation in this issue a monograph on commercial apple growing in the United States prepared by H. P. Gould and Frank Andrews and published by the Bureau of Plant Industry of the United States Department of Agriculture. It reviews the commercial apple growing in California. On the basis of the last U. S. Census it places California eighth in the list of apple-growing states—being preceded in volume of product by New York, Michigan, Pennsylvania, Missouri, Kentucky, Iowa and Virginia. It then proceeds with brief discussions of apple growing, geographically and on the basis of varieties grown, and presents California as follows.—Editors.]

Apple growing in California is widely distributed. From 100 to 500 acres or more of bearing trees occur in nearly every county in the State, but a very large proportion of the commercial crop is produced in two or three sections. The Pajaro Valley, which includes the southern part of Santa Cruz county and the northern part of Monterey county, perhaps more commonly called the Watsonville district, is the most important apple-growing section in California, the two counties named producing nearly 65 per cent of the entire crop of the State. The Sebastopol section of Sonoma county is the second largest district, that county producing about 16 per cent of the normal crop of the State. The other counties, each of which produces 2 per cent or more of the normal crop of the entire State, are San Bernardino (4 per cent), Nevada (3 per cent), and Los Angeles and Humboldt (each 2 per cent). The production in each of the counties not named in the present connection is less than 2 per cent of a normal crop of the State. Recent plantings in San Diego, San Bernardino, and Riverside counties doubtless will increase materially the apple production in these counties within the next few years.

Varieties.—A large proportion of the commercial apple crop of California is made up of three varieties, Yellow Bellflower and Yellow Newtown, grown in the Pajaro Valley, and the Gravenstein, which characterizes the output from the Sebastopol section of Sonoma county.

Perhaps no more comprehensive index of the regional value of varieties can be given than the summary of the responses made by apple growers to a request issued by the Office of the California State Commissioner of Horticulture for information in regard to what were the leading sorts.

The replies to the request for lists (as published by Geo. P. Weldon in his pamphlet on "Apple Growing in California") of the leading sorts in the different sections mentioned in all some 48 different varieties, of which the following 20, listed alphabetically, are given prominence in the bulletin already cited, because of their relative importance in the apple industry of the State:

Arkansas (Mammoth Black Twig).—Grown only to a limited extent, but has some very desirable characteristics.

Arkansas Black—Rather popular

in some parts of Southern California.

Baldwin.—Does quite well in a few favored localities in the mountains. Quite a large acreage has been planted in Sonoma county.

Banana (Winter Banana).—Usually does best at rather high altitudes, though excellent specimens have been grown in Santa Cruz county.

Black Ben.—This variety, or Gano, is suggested for planting instead of Ben Davis, which at present constitutes nearly 4 per cent of the entire crop of the State.

Delicious.—Not yet fully tested, but considered promising in certain parts of the foothills and mountainous sections of Southern California.

Esopus (Spitzenberg).—Not generally grown, but recommended by some for a few localities.

Gravenstein.—Does well in many parts of the State, but is of special importance in the Sebastopol section.

Grimes.—Occurs only occasionally, but as a rule it gives good results wherever grown.

Jonathan.—Not generally grown, but reported to do well in places in Riverside, San Bernardino, San Diego, El Dorado, Mendocino, and Humboldt counties.

King David.—Not fully tested, but considerably planted in some of the younger orchards in Riverside and San Bernardino counties.

Ortley.—Especially mentioned for the foothill sections in Placer and Mariposa counties.

Rhode Island Greening.—Especially mentioned for Humboldt and San Diego counties—the extreme northern and southern parts of the State.

Rome Beauty.—Planted more or less widely. Reported to do especially well in the Yucaipa section of San Bernardino county.

Stayman Winesap.—Not yet extensively grown, but considered very promising for the apple sections of San Bernardino, Riverside, and Tehama counties.

Wagener.—Reported to do well in sections of Humboldt, Mendocino, Sonoma, and Napa counties.

White Pearmain (Winter Pearmain).—Occurs quite generally in the older orchards in many parts of the State where it habitually does well. It is especially mentioned for the mountainous sections of Madera, San Bernardino, and San Diego counties; also does well in the Pajaro and Santa Clara Valleys.

Winesap.—Quite extensively planted in the foothills; it is widely distributed in the older orchards in many sections of the State.

Yellow Bellflower.—Of special value in the Watsonville district where, with the Yellow Newtown, it very largely forms the basis of the apple industry of that section, but is planted more or less widely in many parts of the State.

Yellow Newtown.—The comments under the preceding variety also apply to the Yellow Newtown. Aside from the Watsonville section, it is especially mentioned for planting in Humboldt and Lassen counties in the northern part and in San Diego, Riverside, and San Bernardino counties in the southern part of the State.

Selecting and Rooting Grape Cuttings.

[Written for Pacific Rural Press.]

Make your grape cuttings at pruning, especially if that comes just before growth starts in the spring, if your vines are vigorous, because at that time the food material reserved all winter in the roots is being sent up to the canes in quantities and the cutting will have most food with which to put out roots and new growth. In selecting canes for cuttings, you will get a much better stand of stronger plants if you take those in which there is plenty of food material. Prof F. T. Bioletti of the University of California suggests an easily applied test for this, which should be used if you select cuttings in the winter time. Get a solution of one part by weight of iodine in 100 parts by weight of 75 per cent alcohol. Make a slanting cut through the cane and apply a few drops of the solution to the cut surface. In five minutes a cane having an abundance of reserve food materials will turn black wherever the iodine touched it. If it is weak, only the medullary rays will blacken, showing like spokes of a wheel.

If only a few black specks show the cane is worthless for cuttings and the vine should be pruned heavily. By noticing the last year's growth, only a few tests in a vineyard will need to be applied.

It is reasonable to believe what certain growers have observed, that a cane which bore fruit the past sea-

son heavily, if it is fat and its terminal bud is well matured instead of being wasted away, will make the best and most fruitful vines.

A 90 Per Cent Stand in the Field.
—Of 885 Emperor cuttings planted by A. B. Cate of Fresno county last spring, about 875 grew. A few were lost by allowing them to dry out before the second irrigation, so that when we saw them in the fall, the stand was estimated at 90 per cent and the growth averaged about two feet long.

The cuttings were made from the prunings of his Emperor vineyard Mar. 22. Before pruning, growth had started 2 or 3 inches. They were heeled in upside down and entirely covered with dirt till the second week of April when they were planted in vineyard form. The ends had calloused, but no roots had started.

They were irrigated by furrows two weeks after planting. Before the second irrigation the growth wilted, turned yellow, and some of the young plants died, because it was not applied soon enough. They were irrigated four times during the season.

The question of whether the land might better have been used for a crop the first season, rooting the cuttings in a bed, and planting year-old rooted cuttings the next spring, is not determined. In the light soil of the grape districts of Fresno county, cuttings root very satisfactorily in vineyard form; and perhaps in that way the vines would be enough farther along at the end of the second year to pay for the lost use of the land and the chance of a poor stand.

WHEN TO PLOW COVER CROP.

To the Editor: When is the best time to plow under a legume orchard cover crop to get the most nitrogen? —F. B. A., Lindsay.

When it has matured and quit growing. The most nitrogen, however, is not the only consideration. Enough water must be actually supplied to soak the ground as far down as the tree roots should go, and to keep it moist. If allowed to ripen, it is considerably harder to turn under because it gets tough and is likely to bunch up in front of the plow. While growing, it is using the soil fertility and withdrawing that much from the trees. Unless you have plenty of plant food in the soil for both cover crop and trees the trees are likely to be robbed just at a season of great strain when putting out the first new growth. Unless you have plenty of fertility for the trees' use at this season, it might be better to turn under the cover crop green and early so it may be decomposed and yield up its store of nitrogen when the trees need it, rather than robbing them at that time. On heavy soil the tough, fibrous cover crop is likely to be a great benefit by loosening it, but not so on sandy dry soil.

Southern California is to have a branch of the State Insectary to be located at Alhambra and in charge of E. J. Brannigan who has been several years with the State Insectary at Sacramento.

Prune and Fertilize Citrus Early.

[Written for Pacific Rural Press.]

The National Orange Co. spent \$75,000 last year for manure, bean straw, alfalfa, etc., to use as fertilizer on their 140,000 trees in Riverside county. The heaviest crop seen by a Pacific Rural Press representative in a month's trip in Southern California was that on two rows of Thompson's Improved Navels on their Vivendi ranch. Tangerines also were loaded thicker than a Christmas tree is with popcorn and glitter. Rows of Washington Navels along the road through the Eureka ranch were almost equally heavy with fruit.

But those farther back in these blocks had only a quarter crop "because they were fertilized too late," as told us by E. A. Chase, who has spent 25 years developing the orange industry about Riverside. On a big block in another of their ranches, pruning had been done after the spring growth started. Much of this was necessarily sacrificed, reducing the fruiting possibilities of the trees and wasting the substance they had put into that spring growth. So Mr. Chase emphasized the need of pruning and fertilizing while citrus trees are most nearly dormant in winter; for the trees need plant food especially when putting out new growth.

"Pruning is one of the most important things," says Mr. Chase. "If we had pruned right, after the big freeze, we would already be \$150,000 better off. This year's wood blossoms and fruits next year. You get such wood by pruning. We have been two years cutting out the

wood killed by the big freeze, and are at it now (Feb. 6). The pruning had to be heavy; and you can see through the trees now. But henceforth we think that so far as possible, we will trim out lightly every year or two, keeping out the suckers especially. Where we prune heavy, there is so little fruit wood left that the crop will be light the following year; and also where we prune late, we take out too much fruit wood. January to April is the proper pruning period for Navels. We want to keep the trees open, however, and the fruit wood distributed throughout the trees. We want to produce fruit wood for the following season too; and you see there is plenty of it even on our heaviest loaded trees."

Feeding the Trees.—"But with the best of pruning, you can't get strong fruit wood and fruit, unless you feed the trees what they like and plenty of it. They must have organic matter; and we are seeing results from that. A block in the Victoria grove has a light crop because it was not fertilized well."

"We think bean straw and alfalfa are equal to stable manure or better. Here are three rows, one mulched with alfalfa, one with bean straw, and one with manure. There isn't much difference in crop or growth. You see all of them have fine crops. But here is a row heavily manured and with scarcely any crop, because it was manured too late to help the fruit set last season. Fertilizing in mulched basins reaches the roots,

likely not to be plumb and will make a wobbly line. It is necessary to have the whitewash so the stakes can be sighted as the men cross the field. This sighting takes no time, and if done in several directions, reveals any misplaced stakes before the trees are set.

LAYING OUT A FIELD FOR ORCHARD PLANTING.

[Written for Pacific Rural Press.]

"Never plant the first row of trees so near the line that you will have difficulties with your neighbors while the trees live. Walnut trees should not be nearer than 25 feet from the line," says W. D. McCroskey of Los Angeles county.

Taking a 10-acre piece for example, two men can stake it off in a day. They find the corners and run a wire down one end at the right distance inward from them. Stakes are set at proper intervals along this line, measuring with a steel tape because it does not stretch. At each stake, wrap a piece of auto tape twice around the wire. More than twice makes a bump which might catch too hard when moving the wire. Less tape might slip too easily.

Then the wire is stretched along the side at right angles to the first line and at the same distance from the edge. When this has been staked, the wire is moved across the field parallel with the side, and the far end set for each new row by measuring from the last row and pulling the line tight from the already staked end of the field. Both men then start toward center, placing stakes as they go, after which the wire is again moved.

Stakes should be 14 inches long and sharpened at one end. The other end is dipped in whitewash made of a handful of lime in a bucket of water. Stakes should project not over four inches above ground because if they do, many are

"Get everything right before starting the tree planting, and the work

will move smoothly all through." says Mr. McCroskey.

Olive Trees

50,000 MISSION and MANZANILLO.
The two best commercial varieties.

Splendid, well-grown stock, perfectly clean of all insect pests, with a splendid fibrous root action, in prime condition to plant.

Olives are one of the coming and most important of all economic fruits grown in California. There is a constantly increasing demand for California Ripe Olives, to say nothing about the value of the crop for the production of oil. They require but little attention, compared to other fruits; they grow with a minimum amount of water. Hilly land, unsuited for ordinary fruiting crops, will suit them perfectly, and can be made not only productive, but highly remunerative.

The stock we offer is A-1 in every respect. If you are in the market for a large or small quantity, you will find the prices more than attractive. If you have some vacant land and are wondering what to plant it with, it will pay you to investigate the prices we can quote you on these trees. Sample trees may be seen at our Sales Department at Ninth and Olive. We can furnish them in the following sizes:

1/2 to 3/4-inch caliper.
3/4 to 1-inch caliper.
1 to 1 1/2 inch caliper and over.

If not convenient to call, write us or telephone.

CUT WORMS EAT FRUIT BUDS.

[Written for Pacific Rural Press by W. P. Wickliffe, Parlier.]

Last year some of your subscribers complained of the birds eating fruit buds. The birds do damage some crops; but I have my doubts in this case. Kill some of the birds and examine them to find out if they are to blame.

I think the fruit bud trouble is with the cut worm. Three and four years ago I had my peach crop damaged considerably by the cutworms and I accused the birds; for there were great swarms of linnets in the orchard. Two years ago I had my attention called to the cutworms. The linnets were as thick as the two previous years and I saved my crop by keeping the cutworms off the trees.

The linnets are always thick when there are plenty of worms.

Keep Worms Off.—The most successful way to keep the worms from climbing the trees is to use tree tanglefoot; but do not use it as the manufacturers recommend; for it is too expensive. Coat grapevine twine with tanglefoot and tie it around the trunk of the tree. The worms will not crawl over it. Be careful that no limbs touch the ground or grass.

If the orchard were plowed in the fall or early winter so as to get rid of all leaves and trash I think there would be less trouble with the worms. They work at night and if any one wants to see them, take a lantern and examine the trees. The worms begin to climb between 9 and 10 p. m. I have found them on trees 15 feet high at the top.

INTRODUCTION OF THE FIG INSECT.

In answer to the statement about the coming of the fig insect to California by George C. Roeding, which was published in our issue of February 10, G. P. Rixford has written and filed with us a re-statement of the evidence upon which he and Dr. Swingle satisfied themselves that the insect was abundantly in California many years before the achievement by Dr. Swingle and Mr. Roeding, which consisted in successful introduction and multiplication in 1899. Mr. Rixford in his effort to present the narrative in very condensed form has unavoidably weakened it by omissions, and it seems to us that all readers who are interested to see what Mr. Roeding considers as unsatisfactory evidence of earlier introduction should read the original account by Messrs. Swingle and Rixford which can be found in the Pacific Rural Press of December 17, 1910, and in the "Report of the Fruit Growers' Convention" for that year.

The Department of Agriculture at Washington is making a shipping test of oranges from Southern California. Last week a string of cars was loaded with oranges from San Dimas, Pomona, and Covina and accompanied by two government inspectors, who will take observations all along the line to Minneapolis, which is the destination of the shipments. The inspectors will take notice of the refrigeration, ventilation, transportation, insulation, and manner of loading. Each car has a self-registering thermometer.

Roeding's Page

OLIVES

ON TREES

WHO would have believed twenty years ago that California would be supplying the European countries with the various fruits that she originally exported to the United States?

Today there is not a fruit grown in the great Mediterranean section in Europe, which is not being successfully produced and marketed in California. The success of the olive is a notable example.

Our Nurseries have been more closely associated with the growing of the olive than possibly any other concern in the State.

Twenty-five years ago we were growing over 30 varieties of olives. At that time our attention was given to both the oil and the pickling varieties.

Now that it has been demonstrated that a good pickling olive makes an excellent grade of oil in nearly all cases, the elimination of so many varieties has been very pronounced. The demand has dwindled down to a few standard varieties which seemed to meet the exacting demands of firms engaged in the business commercially.

We have devoted our attention particularly to growing the best types of these recognized standards.

There are thousands of acres of fine land available for olive trees in California.

While olives can be grown on dry lands and the trees maintained by intense cultivation, it is not best to attempt to grow olives for pickling purposes except on land where irrigation can be practised.

VARIETIES TO PLANT.

When planting an olive orchard, it is well to remember that the Manzanillo Olives are picked and in the vat before even commencing

to pick the Mission Olives.

It is not wise to confine your planting to one variety of olives.

The Manzanillo is one of the standards for green and ripe pickles. It also produces oil of a very high grade. It is a very hardy, regular and prolific bearer.

Outside of the Sevillano or Queen Olives, which are so largely shipped as the green olive from Spain, the Manzanillo is the only variety exported from that country.

The Mission has always been a popular variety. The tree is a handsome upright grower; very fine for avenues; the fruit is medium to large; makes excellent pickles and a superior quality of oil.

A large grower and packer in California advises planting a portion of an orchard to Manzanillos and another portion to Mission Olives; by so doing the fruit will not all ripen at the same time, thus allowing the orchardist more time in which to harvest his crops.

Space on this page does not permit of us going into the subject as fully as we would like, but if any one interested in olive culture will write to us, we will be very glad to furnish additional information.

Orders for any considerable number of citrus trees received from all points in Southern California will be filled from our Nurseries at La Habra, Orange County, thus saving time and freight.

CITRUS TREES continue to be profitable. It was not so many years ago when it was generally believed that there was an overproduction, but improved marketing conditions have kept pace with the increasing production. Today there is a strong, growing demand for California Oranges, Lemons, Pomelos and Avocados. Any one who has suitable land, with water, need not hesitate a moment about planting citrus trees, for these trees, with proper care, will return a greater revenue per acre than most any other crop.

Oranges
Lemons
Grapefruit
Avocados

WALNUTS AND PECANS should be extensively planted. They do well in many sections of California and return a good revenue to the orchardist. There are thousands of acres throughout the great valleys in our Coast counties which should be devoted to nut culture.

PERSIMMONS

We have called attention frequently to the desirability of planting Persimmons. The commercial importance of the Japanese Persimmon is well established. We have an excellent stock of the best known varieties of these trees.

Crown Gall from Seedling Stubs.

[Written for Pacific Rural Press.]

Last summer we printed a communication from C. J. Oswald of Kern county telling his experience in following crown gall on about 20 young apricot trees on apricot root, along a sort of curly core which developed discoloration in the deeper wood and terminated in a fermented stub of the seedling tree. On Feb. 13, 1917, he showed our representative results of his treatment which were apparently entirely successful, except in one case, a plum tree, where the knot was not followed to the stub. Two or three knots found on peach trees also seemed healed.

Mr. Oswald re-emphasizes the necessity of nursery seedlings being cut off close to the bud and shellacked, varnished, painted, or asphalted to prevent infection until the wound is healed over.

"On trees infected with crown gall, getting that stub out—that's the thing," says he. "Nurseries leave the stubs so long that when they do finally heal over, it is like healing a splinter in a man's flesh."

Careful digging a few inches deep around each tree while they were leaving out last spring revealed the infected ones. The knots were broken off; and in each case where the inspection late last January revealed apparent success, the curly core, all discolored wood, and the dead seedling stub had been thoroughly removed with a gouge. This tool has a curved edge on the end about half an inch across, and is otherwise like an ordinary chisel. With it, the cutting can be done smoothly. The wound was well var-

nished and the hole left open to avoid reinfection, and to get the benefit of sunlight and air.

Irrigation was never applied closer than 18 inches from the youngest trees; last season on two-year trees it was three feet; next season it will be four feet.

One tree 4½ inches in diameter, operated on last March when well leaved out, had been dug to the center, half the circumference of the bark had been cut off, and nearly half of the wood for a height of several inches.

As seen Feb. 13, it was healing fine, with a clean hole only 1½ inches across. A hole the size of an apple on another tree had healed till it lacked only ½ inch of covering the wound.

One peach tree planted in the spring of 1914 had been shipped with a knot the size of a walnut three inches from the trunk on a root the size of a lead pencil. This root was cut off when planted, and all discolored wood cut out of the tree; but not including the seedling stub. Last spring, a crown gall as big as two fists was found and all roots on that side had knots. These were cut off from the tree, pulled out, and burned, the stub dug out clean, and painted with Bordeaux paste. This spring, the wound shows no gall growth, but a fine roll of growing tissue closing it up. One tree last spring had a knot on each of two sides. Both were followed to the stub so that a hole was cut clear through the tree. It seems clean now, and free from crown gall.

Diamond and Duke Plum on Peach.

To the Editor: I have heard from several sources that plums like Diamond and Grand Duke should not be grafted or budded on peach root. My experience up here is just contrary to this, as the following facts will show: In the spring of 1912 I planted on the site of an old apple orchard (trees removed the winter before) on 3½ acres, 150 Diamond, 150 Grand Duke, and 50 Kelsey, all on peach root. These trees are growing splendidly, especially the

Grand Duke. The trunks of most are over 4 inches, some nearly 6 inches in diameter. Last fall, their fifth year, I had the following crop from this little orchard: Diamonds, 302 crates from 150 trees; Grand Dukes, 241 crates from 150 trees; Kelsey, 108 crates from 50 trees. Total, 651 crates from 350 trees.

For this crop I received \$898.35 from the fruit house. Deducting 25c per crate for picking, shook, packing, and delivery leaves me a net return of \$220 per acre, which I think is splendid for such young trees:

I know of other plantings about the same time on Myrobalan roots (Diamond, Grand Dukes, Gros and Giant) losing many trees each season, while I have lost very few only. Placerville. Chas. Schaeppi.

ALOES FOR RABBITS.

[Written for Pacific Rural Press.]

A fruit grower next to rabbit-infested foothills of Colusa county last year built a rabbit fence around his 24 acres of two-year trees. Jack-rabbits and cottontails showed him how many ways that fence was a joke. But the fruit grower had his trees sprayed early in June with aloes and whitewash, mixed as per boiled-recipe in "California Fruits" and the trees were not bothered any more.

A State nursery to grow trees and shrubs for highway decoration and reforestation is proposed in a bill before the Legislature.

A National Food Investigation.

At the direction of President Wilson the Federal Trade Commission and the department of Agriculture will begin an immediate investigation into the causes of advancing food prices in the United States, with special reference to alleged violations of the anti-trust acts. An emergency appropriation will be asked of Congress for the inquiry. President Wilson's request for the inquiry declares that adequate food supply, a matter of concern to the nation at all times, is of peculiar importance at the present. Despite much that has been done toward obtaining definite information concerning the supply and demand of foods it is not yet clear, he said, what measures are necessary to fundamental improvements.

"It is obvious," the letter asserts, "that there will be no sufficient incentive to enlarge production if there does not exist an unobstructed and economical system of distribution. Unjustifiable fluctuations in prices are not merely demoralizing; they inevitably deter adequate production. It has been alleged * * that the course of trade in important food products is not free, but is restricted and controlled by artificial and illegal means. It is of the highest public concern to ascertain the truth or falsity of these allegations."

Arsenical Dust in Garden Work.

An arsenate of lead powder is very helpful in controlling the biting insects that are likely to attack several kinds of crops, and often appear very early in California. Any standard arsenate of lead powder may be secured, mixed with an equal amount of sulphur, flour, sifted ashes or any finely powdered neutral substance. One of the best of these powders, according to Professor A. L. Lovett, insect pest specialist at the Oregon Agricultural College, is the sifted ashes. The mixture is put into a small sack, or bag of similar material, and shaken over the plants until the right amount has been ap-

plied. Being easily seen, the operator can apply as much or as little as he wishes. If applied in early morning the moisture will cause the material to adhere to the leaves more closely.

"This powder is very effective in controlling flea beetles, diabroticas, slugs, and other leaf-eating pests that attack such crops as beans, lettuce, corn and squash," said Professor Lovett. "An application every ten days should keep the pests under control except when followed by a rain, in which case the new application should be made when the rain ceases.

"Another means of securing protection from the leaf eaters to be used in connection with the powder is the use of trap crops. If in planting beans, for instance, a few hills of squash are planted, some of the vines may be allowed to bear fruit while others are left unsprayed or unpowdered to attract the pests. The pests move about freely from place to place, and simply killing off or driving away a single infestation does not secure immunity from further attack. Protection can be secured only by repeated measures."

SOME MILO STORY.

[Written for Pacific Rural Press.]

Seven acres of milo maize planted in April by J. M. Tigner & Son of Imperial county yielded 12 tons of matured head corn cut in June. The stalks were then pastured by 56 steers for a month, yielding \$84 cash from the steer owner. The stalks looked good for nothing, but a neighbor offered \$17 to pasture some mules on them for a short time. Then he offered \$9 more to pasture three horses on it for a longer time. The field was watered twice a month all through the season, and the crowns of the milo had sent up a good growth of new shoots. If the old stalks had not matured, but had been checked in their growth by drouth or frost, there would have been danger from pasturing the new growth.

The U. S. Senate has passed an amendment to the Agricultural Appropriation bill for an appropriation of \$35,000 to be used in extending the U. S. Plant Introduction Station at Chico.

TALKS ON Nitrogenous Fertilization

Number 10

DO you know that rice is the principal food of more than half the world's people? Over two million bushels was California's contribution to the 1915 crop. The yield, 66.7 bushels per acre, was twice that in Louisiana, where half the crop was grown.

The Department of Agriculture has published figures showing how rice culture has developed in California.

Year	Acreage	Bus. per Acre	Total prod. (bus.)	Avg. farm price	Total value
1910	100	33	3,300	\$0.65	\$ 2,000
1915	34,000	66.7	2,268,000	0.90	2,041,000

A ton of rice and its equivalent straw (4,000 pounds) removes 54 pounds of nitrogen from the soil, which, in California, tends naturally to nitrogen deficiency. Improved cultural methods, and possibly a scattering use of fertilizers, have helped overcome adverse conditions, but further increases depend largely upon the application in sufficient quantities of the most effective nitrogenous material.

SULPHATE OF AMMONIA

is definitely stated by investigators in India, Japan, Hawaii, Louisiana, etc., to be a superior form of nitrogen for irrigated rice. Dr. Kelley (Berkeley Experiment Station) found an application of 300 pounds per acre to give the largest net profit on soils similar in alkaline reaction to those of California.

Applied to small grains or hay crops, Sulphate of Ammonia gives equally attractive returns.

Low Moisture Content of California Wheat

There was held in this city recently a hearing by representatives of the Department of Agriculture, who are gathering data throughout the country before establishing the standards for wheat authorized in the act of Congress approved August, 1916.

J. W. Duval, chief of grain standardization; George Livingston, chief grain superintendent; E. B. Quiggle of the legal office of the Department of Agriculture, and John Wilmeth constituted the Federal party, which listened to the opinions of local grain men.

The proposal is to establish five standard grades for the different varieties of wheat, to be determined by the weight, moisture content, presence of other grains, foreign materials and damaged kernels.

A very important issue was raised by E. Clemens Horst of San Francisco, which he stated as follows:

"To my mind there are two serious defects in proposed standards: You allow the producer or seller nothing for separable extraneous matter of value. You allow the producer or seller nothing for shortage of moisture. Very often the separable extraneous matter in wheat is of as much or greater value than the wheat. It is wrong to penalize for the weight and not pay for such extraneous matter. In some European countries, separable extraneous matter is paid for at its value. The percentage of moisture is a controlling factor between values of Eastern and California wheat. You fix your standard at about 13 per cent moisture. You penalize for any excess, yet you allow nothing on wheat with a 5 per cent moisture, which is about the usual percentage in California, viz.: 60 lbs. wheat at 13 per cent moisture contains 52 lbs. dry wheat; 60 lbs. wheat at 5 per cent moisture contains 57 lbs. dry wheat. In other words, wheat with 5 per cent moisture is worth 10 per cent more in intrinsic value than same wheat with 13 per cent moisture.

"I am of the opinion that moisture

content should be entirely disregarded except in so far as concerns the keeping quality of wheat. That is to say, if the percentage is so great that wheat will not keep, it should be refused any grade. Percentages for that purpose might be used in standards. As between wheats that are sufficiently dry to keep, the standard of moisture should be fixed at whatever you might please, but penalization or premiumizing should be done in proportion to the variation in moisture.

"With the existing high ocean freight rates it is particularly important to get wheat with low percentage of moisture. The ocean freight rates across the Atlantic now run at about \$2.00 per 100 lbs. or \$40.00 per short ton. A steamer carrying 10,000 tons would get \$400,000.00 freight on a single voyage. A difference of 8 per cent in moisture would make \$32,000.00 in freight charges. From this it will be seen that instead of wheat with low moisture content getting no benefit, it ought to get more premium than the difference in moisture content, if the wheat is for export. I do not, however, wish to be understood as recommending any differential in excess of the difference of moisture content.

"The ideal standards for wheat are such as will be based upon the quantity of flour and by-products it makes; upon the color of the same; upon the amount of durum in the flour.

"There ought to be a shorter cut to these results than your standards, which appear to contain factors not in accord, and, in fact, in discord, with an ideal standard."

After Mr. Horst's statement Mr. Duval is reported to have pointed out that, as a less moisture content would be accompanied by greater weight, the proposed classifications indirectly provided for credit for the greater dryness of Pacific Coast wheat. The weights per bushel proposed for the first, second and third grades of the standardization are re-

Knapp Tractor Disc Plow

If you own a tractor, you should also own a Knapp Tractor Disc Plow. It enables you to operate your tractor at greatest efficiency. Plows through hard soil as well as soft. Plows as deep as you desire. Built solid and strong for tractor use. And here's a feature that will appeal to every man who owns a tractor—the Knapp Tractor Disc Plow is

Controlled from the Tractor

The discs lift **CLEAN OF THE GROUND** by an easy motion of the lever, without stopping the tractor, and without the engineer leaving his seat. Tractor and plow thus become a real one-man outfit.

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

in your orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. Mail the coupon.

spectively 61, 59 and 57 pounds, while the minimum moisture content for each grade is 13 per cent. Some of those present thought lot allowances should be made for less moisture content. Duval thought that in practice there would be a slight range of price in each of the grades. The purpose of the standardization is to facilitate sales without samples, the Government licensing inspectors to pass on the quality of the wheat offered under the standardization plan.

It is probable that when the matter is finally adjusted at Washington due allowance will be made for the peculiar character of California wheat as pointed out by Mr. Horst and others.

BEANS FOR FERTILIZER.

[Written for Pacific Rural Press.] Persian grapes among which tepary beans were grown on $4\frac{1}{2}$ acres of one-year vines last summer, made a third more growth for L. M. Stoiber of Imperial Valley than did those on the other half of the same vineyard. The beans had been planted in the spring and the vines plowed under before the grapes were picked.

Beans among Asparagus.—In the large field of asparagus, a lot of pink-bean straw was thrown on for fertilizer before the cutting season. Volunteer beans supplied the ranch with green beans before the cutting season was completed.

When the asparagus was off in April, the ground having been kept continually moist, tepary beans were planted on each side of each row about half way up on the ridges, which are eight feet apart. If planted at the bottom, they would have gotten too much water, for irrigation must continue frequently so the asparagus may mature, and store food in the roots for next spring's crop. The beans were plowed under in July and a volunteer crop sprung up after the first irrigation, to be plowed under in the fall. But summer plowing is too hot work here, and Mr. Stoiber prefers not to plant the teparies until July so he can plow them under in cooler weather after cutting off the asparagus tops and while doing the other fall and winter work. About 12 to 15 pounds of seed were planted per acre, care being taken not to get them too thick on account of their heavy vine growth.

ARTESIAN WELL IMPERIAL VALLEY.

[Written for Pacific Rural Press.] An artesian well of the purest and best water in Imperial Valley is located on Joseph Mondry's place.

It has sufficient flow to furnish ample water for house and stock use. Water emerges from this well at 102 degrees, and when seen on a cold morning the atmosphere for a radius of fifty yards was covered with steam. The well is over six hundred feet deep and cost \$800.

Sugar beet seed must be produced in U. S. according to U. S. Dept. Agr. Several sugar factories were idle last year because of insufficient supply. More than \$100,000,000 are now invested in U. S. beet sugar production, yet at the beginning of the war, we got practically all of our seed supply from Europe.

BUY A
YUBA

What kind of soil have you?

Do you plow it dry? The Model 20-35 has the power to pull the Yuba 6-disc plow—and the plow cuts as deep as you wish. Or wet? The Yuba is the only machine with the traction to harvest rice on wet adobe.

Adobe?

Sand?

Admittedly a hard soil for any tractor. Frankly the upkeep of the tractor will be somewhat greater. But, and this may surprise you, the Yuba Ball Tread wears very little faster under these conditions. The reason? Less bearing surfaces to grind away and better steels to stand the wear.

The Yuba is a favorite for breaking tule land. The high clearance of the Yuba disc plow keeps it from clogging up. The Model 20-35 and plow form a "one man outfit."

Tule?

Loam?

First on the field and last to leave, the Yuba, with its light weight and generous traction area can go on the ground pretty much where you wish. Nor will it pack the soil.

In any soil the Yuba outfit—a Yuba tractor and a Yuba plow—have points of distinct advantage. Write us your conditions and let us tell you something of what you may expect the Yuba to do for you.

How the Storms Got the Prophets.

L. E. Blochman of Berkeley tells how the storms called a turn on the dry-year croakers.

With years of weather observation, distant forecasting seems as hazardous as ever. For seasons may suddenly and unexpectedly change phases completely in the midst of either a very persistent dry or a very wet phase. There was absolutely no sign of rain up to the 15th of this month, and the storm centers had been so far to the north when it did rain that it was acting like the dry or half-dry seasons, so that only scant precipitations could be expected. From early in February till the middle of the month the whole coast was under high (and therefore dry) barometric pressure as far north as Sitka, Alaska.

A Storm Which Passed.—Suddenly the next day a storm area of unusually low pressure appeared in Canada, east of the Rockies, as it does quite often in summer. The weather bureau made only a casual remark about it. None of us realized what it yet meant.

This storm area had come from the Aleutian Islands vicinity, the low-pressure area; but unable to follow down the coast on account of persistent high-barometer conditions, it was forced east of the Rockies and followed southerly to the United States lines. The unusual then happened, it broke in two, part of the storm followed its usual easterly direction, while another part moved in an unusual southwesterly direction, diffusing itself and breaking up the persistent high barometer area be-

tween the Rockies and the Pacific Ocean. A very light rain occurred from its influence in California and Nevada on the 16th, 17th and 18th.

A Storm Which Held On.—But this storm or cyclonic area was caught between the Rockies and Sierras and remained stationary for three days. As a result a storm in the Pacific, which probably had been hanging around some distance west of the coast, was enabled to enter off the Washington-Oregon coast on the morning of the 19th. This last storm or a continuation of it has been hovering over us, giving all parts of the State copious rains. Places which had been very dry previously, received one-third of their total seasonal rainfall from this storm. The storm centered so far south that it came in as a warm rain, a decided change compared with all the previous cold rains.

What Has Come of It.—This rain-storm has been the most beneficial in years in redeeming the season agriculturally and in every other way. Our rivers, creeks and water run-offs had previously been at a very low ebb. Smaller rains sink into the ground; it takes a large rain to give good run-offs for reservoirs.

Vegetables as well as grass and grain had been suffering from the persistent long cold spell as much as from drouth, and these warm, copious rains have in less than a week changed the entire situation, and the country feels more hopeful.

Regulating the Yellowhammer.

To the Editor: Please tell me how to get rid of woodpeckers. They make hole after hole on the walls of our house. Do not wish to have a gun around on account of my children. Is there not some way to

poison them? Kindly answer through the columns of your paper.—A. W., Kingsburg.

[Answered by H. C. Bryant, Fish and Game Commission.]

Judging from your letter, the red-shafted flicker (usually called yellow-hammer) must be the bird which has been bothering you. This member of the woodpecker family is often guilty of drilling nesting holes in buildings. When an individual bird makes trouble resort should be had to the gun. Poison is always dangerous, and besides it would be difficult to find a bait attractive to these birds, for they feed almost entirely on insects. Some people have successfully frightened birds away by hanging pieces of bright tin by strings or by covering the places where they are at work with pieces of tin.

The red-shafted flicker feeds very largely on ants, and in so doing does no great amount of good or no great harm. On the other hand, the bird feeds to some extent on wood-boring insects and this is to the farmer's interest. Consequently we must consider this bird as a valuable ally and must not condemn all flickers in general because one or two give trouble about dwellings. It is justifiable to destroy an individual bird of this species, which is giving trouble, but planted on the high, red adobe land it is not justifiable to take protection from so valuable a bird by the legislative method suggested by Senator Stuckenbruck. Berkeley.

**PER ACRE, THE LARGEST CROP
ON RECORD IN THE U. S.**

Were grown in California and awarded Grand Prize by International Jury, P. P. I. E. Not only was this the largest crop, but the quality was especially fine, bringing a price considerably above the market. The grower attributed a good part of his success to the use of

Gold Bear Fertilizer

The average crop of California is about 150 bushels. What do you get?

W. V. Shear, Potato Expert, says: "Don't try to save money by adopting cheap methods to cut from cost of production. Is it not good business practice to spend enough money to produce a good crop and make money on the investment rather than use cheap methods and lose money?"

Fertilizing is not an expense, but an investment, yielding immediate returns.

Let us help you solve the problem of bigger and better crops.

"The Old Lines"

EVERYBODY speaks of them as "the old lines," many perhaps without realizing how thoroughly new and up to date are all these **Champion, Deering, McCormick, Milwaukee, Osborne and Plano** mowers, rakes and tedders. What really good improvement was ever made in haying machines that did not show itself first on one of these machines? Where can you find mowers, rakes, or tedders that need so little adjustment, so few repairs, or that are so easy to repair when they do need it? Nowhere. These old standard machines, known to farmers for three quarters of a century, can still be depended upon to get in all the hay from any field and to make the work light for the farmer.

When you need a mower, rake, or tedder, see the local dealers who handle the **International Harvester** lines. We can remind you here that our machines have always done good work, but the dealer can show you why they still do it. You will find that the local dealer has just the size and style you need. Buy from him.

Strathmore orchardists are expecting irrigation district ditch water by the last of June.

California gets \$302,127 of the National rural post roads appropriation.

PLENTY OF FINE WATER IN IMPERIAL VALLEY.

[Written for Pacific Rural Press.]

The stranger in Imperial Valley very often drinks something different, though not stronger than water. But Imperial Valley has some of the best water in the world, as it was a pleasure to find on the ranch of R. W. Campbell. The cost of getting this fine water was so insignificant, and it was so freely used all over the house and yards, that he can tell how he did it.

Water from the irrigation canal is let into a pool through a pipe. After it settles a day, a faucet allows it to run into a concrete box 2½ feet wide, three deep, and 14 feet long, set flatwise with its top level with the ground. This box has three compartments, the partitions leaving a two-inch opening across the box for water to pass. In the first compartment is coarse gravel; in the next, about 50 pounds of charcoal; in the last is finer gravel mixed with sand.

From the last section, the water runs into a cistern about 10 feet in diameter and 12 or 14 feet deep. The cistern is of cement bricks made for the purpose; and the inside surface is plastered with rich cement.

Thence the water is pumped into a galvanized iron tank about 20 feet high, protected by a wooden roof-shade. This provides fire protection and pure running water for sanitary and kitchen purposes as well as for stock, etc.

PUTS SEED POTATO INTELLIGENTLY.

[Written for Pacific Rural Press.]

When you start cutting seed potatoes, cut one lengthwise through the center and cut a thin slice from one of the flat surfaces. Hold that slice up to the light and notice how the "roots" of the eyes run to the center line at an angle toward the stem end, says M. A. Bryte of San Mateo county.

To get thriftiest plants, hold the potato with the seed end in the palm of the left hand and cut from above the eye toward the stem end to avoid severing those "roots." The eyes will grow without them if conditions favor, but since the young plant depends absolutely on the piece of seed potato for its food until green leaves are made, it stands to reason that it will make better growth if its connections with the reserve food are not cut.

One eye per hill, if cut this way, is reasonably sure to give a good stand if the ground is warm when planted. Two eyes per piece are a waste of high-priced seed.

PREFERS MILO ROLLED.

[Written for Pacific Rural Press.]

"I never want to feed milo in the feed again," says W. W. Cochran of Imperial county. "It is thrown around into the mud or tramped on when you feed it to the horses and dogs. Some of the grain comes through whole, too. Look at those heads in the hog pen. They will never be eaten unless we starve the hogs to it; and we can't afford to do that. I want to feed it rolled or ground, preferably steam-rolled and mixed with skim milk for the hogs."

JOHN DEERE IMPLEMENTS

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-12.

JOHN DEERE, MOLINE, ILL.

Van Brunt Grain Drills

Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.

Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.

Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.

John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory.

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

John Deere-Syracuse Sloping Land-side Chilled Plows are unsurpassed for general purpose work in light soils. They leave a clean, open furrow bottom.

Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—noted for satisfactory scouring qualities, strength and uniformity. Right and left hand styles.

John Deere Combined Cotton and Corn Planters

Cotton seed cannot choke up in the hopper—a cotton picker wheel prevents it.

John Deere OBLIQUE SELECTION, HORIZONTAL CELL DELIVERY SEED PLATE for corn—an accurate drop.

Positive gear drive with dirt-proof gear case.

Special shaped shovel with reversible points opens furrow and pulverizes the soil without throwing it up on the face of the shovel. Soil falls behind and covers the seed.

Adjustable press wheel can be furnished. No lever used on this press wheel.

Depth of planting can be regulated with the foot while planter is in motion.

tested out through years of satisfactory field use. A cotton picker wheel extends through the bottom of the hopper. This wheel revolves in one direction and the cotton spider in the other—separating the seed without damaging it. Change in quantity is made by turning a thumb nut on the hopper.

Hoppers are beaded. Seed plates fit perfectly. All the seed in the hopper is planted. Peanut plates or a special hopper can be furnished for planting shelled or unshelled peanuts.

John Deere Harvesting Machinery

John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

The John Deere Grain Binder has wide and high bull wheel—great power. Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horses and makes square corners and full swaths possible.

John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

Your Home Town Dealer

There is a big advantage in buying implements of your home-town dealer.

He gladly "backs up" the implements he sells, and he is on the ground to see that they make good. He makes his home in your locality—the place his goods are sold.

He handles a line of high-grade implements—and you can see before you buy. In the busy season, when work is pressing, he can furnish repairs promptly for the goods he sells.

If, by chance, he has not in stock just exactly the style of implement you want, he can give you quick service in getting it to you.

John Deere factory warehouses with immense storage rooms have been established in various sections of the country. Every John Deere dealer is conveniently located to one of these houses.

This, really, gives you two supplies of implements—the stock carried by your home-town dealer and that of the factory warehouse.

General Agricultural Review.

GRAINS AND FIELD CROPS.

Alameda county wheat fields are being hurt by Hessian fly.

A two-pound potato sold in Stockton recently for 10 cents.

Imperial Valley alfalfa is now \$22 per ton baled at the ranch.

Barley and alfalfa in Imperial county are looking very good.

Threshed milo was bringing Calexico producers \$40 per ton Feb. 24.

Merced county has an unusually large acreage in grain this year.

Co-operative packing and hauling of cantaloupes is proposed in the Turlock district.

Tomatoes for the Tulare cannery are a prospective crop if enough

acreage is signed up.

G. H. Peters of Kern county is said to be harvesting at this time a potato crop worth \$37,000.

Lower California tomatoes, sweet potatoes, and vegetables are being shipped by boat to San Diego.

Minnesota buyers offered \$80 per ton for Washington State potatoes recently, but couldn't get them.

Yuba county hops are being taken out and the land put into food crops such as potatoes and beans.

Wisconsin cabbage growers are treating their seed with formalin to prevent black rot and blackleg.

A Stanislaus bean grower is reported to have received \$10 per sack for 170 sacks of Lady Washingtons.

All surplus wheat and oat hay in the Tulare country were sold early in the season, and alfalfa hay also is scarce.

Lettuce is bringing Imperial Valley producers \$3.50 per crate, potatoes 3½ cents, and cabbage \$1.50 per crate.

Imperial Valley head lettuce is being introduced into markets dominated by Florida lettuce previous to this winter's freeze.

Short weight baled hay is doomed if a bill favored by State Sealer of Weights and Measures C. G. Johnson becomes a law.

Red Italian onions are being planted on the red dirt soil of Butte county, where they did well on a small scale last year.

Thirty per cent of alfalfa being sowed locally is of the Peruvian varieties, according to our correspondent at Calexico.

Riverside's decomposed granite soil is ideal for early potato growing according to E. H. Grubb, the potato specialist.

Formalin seed treatment of oats is recommended by the Ohio Experiment Station to prevent loose or head smut.

The stock of red onion sets is reported all sold, but there are a good many yellow onion sets left in the Stockton houses.

Though there are some discontented melon growers in the Turlock district, prospects are for a large increase in acreage this year.

The Rice Land and Products Co. of Colusa county are increasing their rice acreage by 1000 acres and installing new pumping plants.

Delta asparagus shipments commenced about Feb. 20, but big shipments are later than usual on account of the dry cold winter.

A special course in grain sampling is offered at the Oregon Agricultural College to help familiarize farmers with the new federal grain standards.

Fourteen varieties of beans are used in making the 14 letters of the Knights Landing sign at the Yolo County Board of Trade rooms.

Hairy Peruvian alfalfa when seen February 17 by our representative on the I. J. Harris ranch near Imperial stood no less than fifteen inches high.

To kill bean weevils, the Mo. College of Agriculture recommends an ounce of carbon bisulphid per 75 pounds to be placed in a tight receptacle with the beans and above them in a saucer.

Minnesota and Wisconsin potato growers are asking reduced freight rates to Texas, but the California Wholesale Potato Dealers Ass'n is opposing it.

The Pima strain of Egyptian cotton developed in Arizona was planted on 275 acres last year and will be tried out in Imperial Valley, California, this year.

"The 16,000 acres of beans and 22,000 acres of sugar beets in Monterey county will bring several millions of dollars besides the grain, po-

Sudan Grass

CALIFLORA BRAND

This is one of the best-known forage crops used in the Southern and Middle Western States. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—lb. 50c; 10 lbs. \$4.00; 100 lbs. \$35.00.

Alfalfa Seed

CALIFLORA BRAND

This is our best grade of common Chilean alfalfa seed. On every test this brand of Alfalfa Seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample.

We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Tractor Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

A shipment of 11,000 olive trees
was recently made to Butte county
from Orange county.

A. L. Gillespie is planting 5000
Thompson and 2000 Malaga cuttings
and 1,000 fig trees near Imperial.

Fifteen hundred Mission fig trees
are to be planted on the P. N. Ashley
ranch near Madison, Yolo county.

A meeting of fig growers in Fresno
Mar. 1 discussed: A standard mini-
mum price for the different varieties
of figs to all growers each season;
the selling of any unsold 1917 figs;
the planting of a Capri fig orchard
in a thermal belt of the San Joaquin
Valley as suggested by Henry Mar-
karian of Fresno, to be maintained
by the organization for caprification
and a dependable source of supply
at a minimum cost; a better or stan-
dard, uniform pack of figs along the
lines that the Peach and Raisin or-
ganizations are operating.

DECIDUOUS FRUITS AND NUTS.

The Manteca cannery is to have a
\$15,000 addition this season.

The Earl Fruit Co. is contracting
Placer county peaches at \$32.50 per
ton for Phillips and Tuscans.

A bill has been introduced in Con-
gress prohibiting the storage of
apples for more than 90 days.

A newly planted apricot orchard
of 12,000 trees is that of Messrs.
Hutchings in San Miguel canyon,
Monterey county.

Over 12,000,000 pounds of cher-
ries were exported from Naples,
Italy, to U. S. in 1916 as against
4,720,392 pounds in 1915.

Walnuts, shelled and unshelled,
shipped from Bordeaux, France, to
U. S. totaled 10,759,738 pounds in
1916 or over 3,000,000 pounds less
than in 1915.

Almond exports from Naples,
Italy, to U. S. in 1916 were 3,053,-
934 pounds while in 1915 they were
only 240,053 pounds. Walnuts from
the same port decreased from 8,080,-
482 to 1,616,622 pounds.

Canning peaches in the Loomis
district of Placer county have been
contracted recently for 10 years
ahead to Libby, McNeil and Libby
at \$25 per ton for Levis and \$27.50
for Phillips, all to be over 2 3/4 inches
in diameter.

NATIONAL ORANGE SHOW.

The Seventh National Orange Show
held at San Bernardino Feb. 20 to
28 met full success. Despite the bad
weather the exhibits were never
fuller and better than this year.
Oranges and lemons in their great-
est perfection and largest numbers
were seen this year. The features
and individual exhibits were of a
character never before surpassed. It
features the orange and lemon in-
dustry of California in a wonderful
manner. On several days the at-
tendance is said to have reached
20,000 to 25,000. Not alone was
the display of golden fruit such as
to draw forth admiration and won-
derment, but the industrial exhibits

were most interesting. All kinds of
farm and orchard machinery were on
hand, showing the advance that has
been made in the agricultural imple-
ment world in recent years. There
were tractors, sprayers, pruners,
cultivators, weeders, mulchers and
many other devices, making the ma-

chinery and farm exhibit one of the
most interesting of the show. Citrus
by-products were a strong feature.
Lindsay again won first prize for the
best feature display. Riverside
showed a box of oranges from one of
the two original Washington Navel
trees.

The Little King of Tractors

The Bean TrackPULL Six-horse Tractor combines giant strength
with light weight and long traction. Just think of a tractor so small
that it goes under the boughs of trees only 4 feet off the ground!
Gets into corners where a team could never go, and works right up
close to the trees and between anything that grows in rows only 7
feet apart.

That's what the Bean TrackPULL does. It will do your plowing,
your cultivating, and your disking, and then run stationary machin-
ery when it is not working in the field.

It actually does the work of 6 horses on what it would cost you
to feed one team, and you can work it 24 hours a day if you want to.

Pulling Three 10-inch Bottoms.

The Bean TrackPULL is ideal for
soft soil and cultivating. It weighs
only 2800 lbs. and pulls itself over
the ground. This is a big advan-
tage over a tractor with rear drive.
It does not get stuck in soft places.
You simply turn right or left, like
a team, and keep going. The Bean
lays its own track on which it pulls.
The wide track offers the least re-
sistance which means that the Bean
is most economical to operate. The
Bean TrackPULL costs only \$975.00
and is the only track-laying tractor
selling for under \$1800.

The Ideal Tractor for
Orchard and Open Field Work.

Best Construction Lasts Longest

The Bean TrackPULL Six-
Horse Tractor is built in one
size only—6 H. P. at drawbar
and 10 H. P. at belt.

The motor is a Le Roi 4-cylin-
der vertical type—4-cycle—
equipped with: Donaldson air
clarifier, Bosch ignition, Perfex-
radiator—water cooled with cen-
trifugal pump and fan, combina-
tion pump, and splash lubricating
system.

Famous Hyatt roller bearings
used in track wheel and sprocket
also in track rollers. There are
six New Departure ball bearings
in the transmission, running in
grease and all dust proof. Gears
are steel. No differential or other
complicated mechanism.

Prompt Deliveries in April

We are behind on orders and are
working night and day. We are build-
ing a large addition to our plant to in-
crease our capacity and will be able
to make prompt shipment in April.
You know the Bean Sprayer! The
Bean TrackPULL Tractor is as good as
the Bean Sprayer.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

ORCHARD TRACTORS PREVENT SOIL BAKING BY EARLY DISKING.

[Written for Pacific Rural Press.]

It is so urgent to get the orchard soil disked before it hardens in part of the Tulare citrus district, that the Gillette Ranch has recently bought two new tractors in addition to two already in operation in their 280 acres of citrus and olive trees. The whole ranch was sowed last fall to mixed vetch and melilotus, which did not grow so well as usual on account of the long-continued cold of the past winter. One piece grown up to weeds was being disked in mid-February. The soil was turning up beautifully mellow, but such a condition would not continue long without rain or irrigation. An 18-horse-pull tractor was drawing a double disk of 24 plates loaded with about 650 pounds of iron. A 32-plate double disk with 500 to 1200 pounds weight is ordinarily used with this machine, which would reduce the number of trips per row from three to two. This tractor was run night and day in the orchard last year and two-thirds of the nighttime the year before that, according to ranch foreman C. H. White. Cutaway disks weighted down are preferred on account of the cover crop and weeds; and one built especially for tractors has been bought recently.

"At this time of year we can put the ground in as good shape with disks as we can with plows two months later," says Mr. White. That is why tractors are being used to rush the work. Deep cultivation and furrowing will be done later with tractors, for part of the 14 mules and horses now on the ranch will be sold. Some will be kept, however, for there is always work that horses can do cheaper than tractors. An example is the checking for cross irrigation within the rows which is practiced here. The present tractors are not considered suitable for hauling on the road either, though Supt. King G. Gillette of the ranch has assembled a very fast-traveling machine, with which 10 acres have been furrowed in 1½ hours.

Conglomerate Tractor.—A Hudson automobile engine and a Butck transmission have been put onto an old Samson tractor along with some Ford parts. The speed at which it runs is too great for the strength of some of the parts according to Mr. White, and in hot weather some extra cooling device would have to be added. But tractor work done at four miles per hour is as good, says he, as at slower speeds.

AUTO TRUCK FOR MILK, FREIGHT AND PASSENGERS.

[Written for Pacific Rural Press.]

A 2½-ton auto-truck is providing a market for milk in San Pasqual Valley, San Diego county, and is encouraging greater production of alfalfa, apricots, chickens, and veal to sell to San Diego. Before the flood, there was a lot of alfalfa land in the valley, but the nearest railroad is at Escondido, over at least

four miles of hills besides the valley haul. Another outlet is 37 miles to San Diego by road. So no one could raise more alfalfa than he could feed or sell to his neighbors. E. H. Webb had nearly 300 acres of alfalfa then; and he couldn't feed it all. Four years ago he bought the truck. Two years ago he began to haul milk daily to San Diego. Now their truck is the transportation facilities for the valley.

Mr. Webb milks an average of 60 cows throughout the year and gets about an average of 120 gallons of milk per day. Many of his cows are heifers and not milking so heavily as they will later. Between the Webb place and San Diego some 40 to 50 ten-gallon cans of milk are added to the dozen from his own cows. People in the Valley above him deliver their freight at his house before 7 a. m. daily. Some poultry, veal, fruit, and an average of nearly two passengers per day are carried. On the return trip, supplies are hauled for patrons along the route. This year, because his silos washed away in the flood, Mr. Webb has been feeding beet pulp to balance the alfalfa. He has a barn stacked up with it, having hauled it out from San Diego. It is so much more convenient to patrons along the route than hauling produce to and from Escondido over the hills, that another truck may be put on not long in the future.

"The truck pays its expenses and its original cost in a year," says Mr. Webb; "and then we have it left good for two or three more years. My son drives it and takes care of it. I think he uses about twelve gallons of distillate per round trip."

Though most of the roads are unpaved, he has never failed to get there with the milk. There was difficulty, however, due to smooth tires, last year. Now he has block tires, the double line of blocks alternating so they get a good hold on slippery roads.

It was thought at first that the milk could not be delivered so far and only once daily, in good condition. At first it was found sour a few times. The troubles were found and remedied, however, the principal feature being to cool the milk with water that had to be cooled without ice. But that is another story. The second year there has been no complaint and the creamery manager to whom the milk is delivered says it is among the best he receives.

TRACTOR GRINDS HOG FEED.

[Written for Pacific Rural Press.]

We found G. R. Cloes of the Cloverleaf Ranch in San Diego county grinding milo heads and Indian corn into a coarse meal for his fattening hogs, using the 30-13 h.p. tractor for power. The tractor had simply been run up the alley between hog pens, and set in neutral in line with the grinder. It was making 1½ tons of readily available yet somewhat bulky ground feed per hour, though Mr. Cloes said it would grind 3 tons of Indian corn alone per

KILLEFER
EFFICIENCY

KILLEFER
QUALITY

Beet Cultivator

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds its rigidly in line except on the turns. This is the strongest and best made Beet Cultivator for sale on the Pacific Coast.

MADEWELL SURFACE PIPE
ROBINSON HARDWARE CO.

Smooth Lock Seam Sleeve

Here is an exclusive Madewell feature that appeals to every user of Surface Pipe. Seamed inside with perfectly smooth surface. Much stronger than the old-fashioned lapped and riveted seam used by others.

Madewell Surface Pipe

is recognized in established surface pipe districts as having the strongest, smoothest, and most practical construction.

Our Long Lock Seam is the best seam possible to make—and in addition is carefully soldered the entire length so that it stays water-tight. Strength and Smooth Finish are the big things to consider when you invest in surface pipe.

Circular containing 100 mechanical movements mailed free.

hour. This feed is soaked about 12 hours before the hogs get it in two feeds per days. Three hours' work grinds enough for two or three days. Mr. Cloes has 350 head including sows and shoats, and is working principally into purebred Berkshires. Barley also is ground for some of them.

Other Uses.—A buzz saw had just been brought home to be run by the tractor to cut fire wood, and the 36-foot twin silos had also been filled by tractor power. Mr. Cloes said, that while he had some trouble in plowing side hills with this machine because the front wheels would slide down hill sometimes, he could plow 10 acres a day of good bottom land.

CANVAS HOSE FOR IRRIGATION.

To the Editor: I would like information regarding the strength of canvas hose, and the possibility of being able to use the same in connection with a pumping plant for irrigation purposes. I have a 7-inch pump with which I desire to raise water from the river, a total lift of about 15 feet to the top of a bluff and then force it through a canvas hose 1150 feet long. During that distance there would be a 9½-feet rise to the highest point on the land to be irrigated. Would the hose be strong enough to allow 1500 gallons of water to go through it per minute on a total rise of 9 feet to 10 feet through the 1150 feet of hose?

—C. G. K., San Francisco.

[Answered by Prof. S. H. Beckett, University Farm, Davis.]

A 7-inch centrifugal pump discharges in the neighborhood of 1200 gallons per minute. If this quantity of water is put through a 12-inch diameter canvas hose a friction head of at least 10 feet will be developed in a distance of 1150 feet. This must be added to the existing head of 9 to 10 feet mentioned in the inquiry, making a total of approximately 20 feet. This is a much greater head than the heaviest canvas hose will stand under continuous operation. Under the conditions I would advise the use of 10- or 12-inch diameter slip joint pipe.

SMALL PIPES INCREASE FRICTION.

[Written for Pacific Rural Press.]

Many people in installing pumping plants forever have to pay for extra power or put up with insufficient service because they use pipe of too small diameter.

One such is the little plant used for irrigating a few hillside acres for F. C. Perrigo in San Diego county. His well is in the river bottom and is 15 feet deep, being only five feet to water. A 1½ horsepower engine works a plunger pump with a cylinder 5x18 inches. About 230 feet of pipe carry the water to a 50-foot elevation, whence it is distributed to the house and gardens and five acres of melons by about 535 feet additional pipe. The pipe is 1¼ inches in diameter and the engine has all it can do to force the water through it. With a two-inch pipe, the friction of water in the pipe would be reduced to about ⅓ and the power reduced considerably or the flow increased.

AUTOMOBILE NOTES.

Signal vehicles in the rear before slowing down or stopping on the public highway.

Slow down when approaching any cross roads obscured by trees, shrubbery or houses.

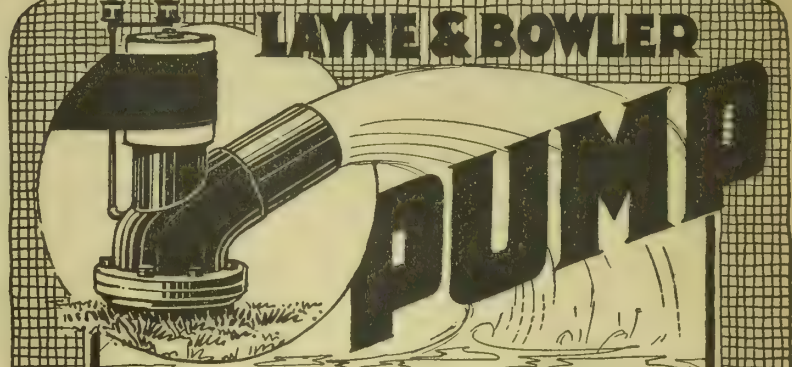

Be cautious approaching public meeting places, such as churches, halls and hospitals.

Stop. Come to a dead standstill when a pedestrian becomes confused in front of you.

Stop, look, listen and think, before crossing car tracks. Don't take chances.

Don't allow children to operate your car. To do so might amount to criminal negligence.

LAYNE & BOWLER PUMP

The severe duty of Western irrigation service requires a pump designed to operate at low cost without danger of a breakdown or trouble. Its construction must be extremely simple and of such a character as to meet widely varying conditions. Layne & Bowler Pumps meet these requirements perfectly. Over 5000 in actual operation testify to this. Let the World's largest water developers solve your pumping problems. Our interesting catalog No. 25, on irrigation and pumps is yours for the asking. Write for it.

AWARDED GOLD MEDAL
HIGHEST AWARD EVER

Grades Average 320 Pounds Fat.

[Written for Pacific Rural Press.]

Always we are told by owners of high producing herds of dairy cows that the first steps in building up a herd are comparatively easy; that a herd of low producing grades can be bred up to an average production of 225 to 250 pounds of fat a year with a very few top crosses of purebred sires, but when a higher minimum per cow is secured a longer time is necessary for each additional pound. This experience fully corresponds with that of John Denman of Sonoma county who has been 26 years building up a herd of grade Jerseys to a 320-pound fat average per year.

When Mr. Denman started to use registered Jersey bulls in 1981 he also began to weigh and test his milk, his average for the first year per cow being 142 pounds of fat. From that mark he increased the production of his herd to a 240-pound average with little difficulty, weeding out the low producers by weighing and testing his milk regularly. After that, however, his yearly average gain per cow in butterfat was smaller, although he con-

tinued to use purebred sires and weigh and test his milk. But it was sure; and that accounts for his 320-pound average during a 10-month lactation period at the present time.

In late years Mr. Denman has stopped monthly testing of his milk, securing almost as accurate results he finds by sampling four milkings and making a composite test of the lot. By testing each cow's milk in this manner twice during her lactation period he is able to ascertain her approximate average test. Weighing is done regularly one day of every month; and as a result the comparative value of each cow in his herd is arrived at. Regardless of the cow these weights and tests are entirely relied upon in the selection of the milking herd, the good ones being retained and the poorest ones disposed of.

SALT FOR DAIRY COWS.

From one to two ounces of salt daily, according to the amount of milk produced, is sufficient to meet all requirements of the dairy cow on rations of ordinary feeds according to Dr. E. B. Forbes of the Ohio Exp. Sta., who found one ounce of salt a day satisfied the cows' needs when producing as much as 45 pounds of milk daily.

The Visalia Co-operative Creamery on Feb. 21 paid out the largest amount at the highest rate ever paid for January cream in its history. About 264,000 pounds of cream was delivered from which 102,500 pounds butter was churned, for which the farmers received \$35,000 at 42½ and 43½ cents per pound, according to the Weekly Visalia Delta. A year ago the price was 11 cents lower.

T. B. Purvine is just completing semi-official tests on 24 of his registered Jersey cows in Sonoma county. He states that 19 of the lot will make the Register of Merit. Park Beauty Roma, an aged cow in the herd; made 550 pounds of fat during the year and Fairy Boy's Finance Evelyn, a 2-year-old, made 375 pounds fat.

Mrs. Phillip Duffy, who has been breeding Durhams exclusively near Napa, is now starting a Holstein herd. Her recent purchases include

HOLSTEIN CATTLE

The highest prices ever paid in the St. Paul yards for a cow or a bull for best were paid within a year for Holsteins. Two 2-year-old Holstein cows 13 years old brought \$187, one 12-year-old registered Holstein cow \$116 and a registered 4-year-old Holstein bull \$168.93. In considering Holstein cattle as a dual purpose breed, the above mentioned facts render further comment unnecessary. There is big money in the big "Black and White" Holsteins.

Over a Million Users!

P. M. Sharples made the first separator in America (38 years ago). Sharples has been the foremost and highest-class American separator ever since. The Sharples Separator factories are the largest and longest-established in America. Sharples machines are found in every dairying country of the world. The reason for this popularity is that Sharples separators have invaluable patented advantages found on no other make.

SHARPLES SUCTION-FEED CREAM SEPARATOR

- the only separator that will skim clean at widely-varying speeds
- the only separator that gives cream of unchanging thickness—all speeds
- the only separator that will skim your milk quicker when you turn faster
- the only separator with just one piece in the bowl—no discs, easy to clean
- the only separator with knee-low supply tank and a once-a-month oiling system

The Sharples has entered a new field of cream-saving which no other separator has yet touched. This is owing to the wonderful Suction-feed, which enables clean skimming at widely-varying speeds—which saves \$100 yearly (sometimes more) on the average farm, over every other separator.

The Sharples is not only capable of doing good work, but will always automatically do good work under the most unfavorable conditions. We have spent years of experiment in perfecting a separator that is an Insurance Policy against Carelessness. That ideal has been realized in the Sharples Suction-feed. Write for catalog to Dept. 31.

Breed for Butterfat

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

Beryl Clothilde Hengerveld, Champion in Butter-fat Contest, Sacramento, 5-day record, 21.11 pounds, test 4.7 per cent.

My young herd bull, DUTCHLAND SIR PIETERTJE CREAMELLE, has high-test breeding, and is transmitting this breeding to his sons and daughters. Five tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, Clothilde Pontiac Creamelle, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service.

WRITE OR CALL AND SEE THEM.

Bacteria Count Reduced Cheaply.

[Written for Pacific Rural Press.]

J. D. Huston of Imperial is the only dairyman we found who is shipping sweet cream from Imperial Valley to Los Angeles for fresh consumption. His milk is rated Grade AA and usually has a bacterial test of about 10,000 after the long hot trip. The day before we visited his ranch, two cans had tested 5,000. This is a wonderful record, as cited to us by deputy health officer F. Redding of Imperial county.

"I worked seven or eight months to get the test below 50,000," says Mr. Huston. I clipped and washed the cows' bags, sterilized the cans, refrigerated the milk, had airy cement-floored barns constructed, washed out after each milking, used covered milk buckets, and tried every conceivable way to reduce the count. Finally I sent the evening's milk separate from the morning's and got a high count on the latter, but a low count on the evening's milk. The reason was that the cans for the morning's milk were washed at night and set on the rack but did not get any sunshine. All of the cleanliness and steam sterilization had not been enough; and the cans each morning would infect the milk put into them."

It cost just \$15.80 to get a sterilizer that has solved the problem. It is made of galvanized iron about 3x4x6 feet, set on concrete base, and has two large doors in front which

may be closed steam tight. The separator bowl, disks, buckets, and cans are packed into this after being cleaned each milking; and when all through other work, the live steam remaining in the boiler is all turned into the sterilizer for perhaps 45 minutes or as long as it lasts. The sterilizer is often still hot at noon, for it is kept closed tight until utensils are needed again. A safety-valve lets steam out if it comes in with dangerous pressure.

Ground has just been broken at Galt for the erection of a \$200,000 milk condensary, with a capacity of 100,000 lbs. of milk daily; It is understood about 5000 cows have been signed up for this. The Utah Milk Condensary are the owners of the new plant. The plant was secured through the efforts of J. M. Henderson, Jr., who is also giving a large amount of his time to organizing the milk producers of the Sacramento Valley.

Jay Dutter of the Henderson Co. at Galt writes of "the enlistment of two more enthusiastic boosters of Holsteins, A. A. Quackenbush and A. R. Strother of Acampo, who have just purchased of us a splendid young bull, Supreme Glista Pietje, whose dam has a record of 32.39 pounds butter in seven days." Messrs. Quackenbush and Strother have mostly grade cows but propose to get purebreds soon.

This "Warning Signal"

Insures proper speed on every NEW De Laval Cream Separator

NINE people out of ten turn the separator handle too slowly.

Thousands of tests with experienced separator operators show this to be the case.

Other tests made by the highest authorities have shown conclusively that there is a big cream loss when the cream separator is not turned fast enough.

You will avoid such a possible cream loss if you buy the New De Laval. The Bell Speed Indicator on the New De Laval is a "warning signal" that insures proper speed at all times. No matter who runs your De Laval, this "warning signal" will tell you when the speed is not right. You hear it, and do not need to see it. This one feature alone may easily save you the cost of a cream separator in the next few months.

But that is only one of the big advantages of the New De Laval. Other advantages are greater capacity, closer skimming and easier turning, simpler bowl construction, and easier washing.

If you haven't the spare cash right now, that need not stand in the way of your getting a New De Laval right away. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

Winner of Pacific Rural Press prize for January, K. W. Abbott; average production of 5 grades, 56.605 pounds butter fat.

Winner of McAlister & Sons prize for January, Napa State Hospital; grade H. No. 67, 81.605 pounds butter fat. Total entries to date, 160 cows. Average production for January 1917 (98 cows): 1303 pounds milk, 54.37 pounds fat (range, 104.47 to 23.9 lbs.).

Totals for 98 cows: 4714 days, 127,706.8 pounds milk, 5328.367 pounds fat. The rules for awarding the monthly prizes of \$25 each, offered by Pacific Rural Press, San Francisco, for the highest production of five grade cows in a herd during a calendar month have been modified, to the effect that the award may be made for the production of five pure-bred cows in a herd, in case no group of five grade cows is eligible.

Beef Raising Easy in Campo Valley.

[Written for Pacific Rural Press.]

Green wild feed almost the year around makes beef raising easy and profitable on the Campo plateau, surrounded by the mountains of San Diego county. One of the progressive breeders there is A. Chilwell, who last year got about 400 calves from 550 cows under wild-range management. The stock is high-grade Hereford, and the feed is mostly wild pasture; but about February all cattle have to be fed on wild hay. Late in May the cattle are driven to the surrounding mountains to let the level ranch pastures grow all summer. Part of these are cut in July for the next spring's hay, and they grow into good pasture before the cattle are brought back. The grass stays green from about April 1 until the frosts of November.

Bulls are put with the cows from June 1 until Oct. 1 to bring the calves April to August; but mostly in April and May while the mountain feed is best.

About September in a common year the mountain feed begins to fail and the cattle are brought back to lower pasture about Oct. 1 to Nov. 15, those in best condition being left longest.

Branding and Weaning. — The April and May calves are branded about June 1 and weaned at the fall branding. The calves from June 1

to July 15 are branded and taken from their mothers at the same time, about Oct. 1. Later calves are left with the cows on good pasture through the winter until feeding time in February, when they are separated and put into one of the dozen fields on the home ranch. They also are fed the same kind of hay until pasture is green again.

WOODEN SILOS ALL RIGHT IN IMPERIAL VALLEY.

To the Editor: Can wooden silos stand the summer heat in Imperial Valley? And does silage keep in the hot weather there?—Subscriber.

They do. G. V. Rude on the A. J. McPherrin Jersey ranch near Imperial put up 190 tons of milo silage in the middle of last August in a stave silo and fed it out steadily from a week after it was put up. It kept fine until about November 1 when it had been mostly fed out and both silos were filled with Indian corn. A one-inch stream of water was pumped into the silage distributor with the milo. One silo was empty from winter until August. Both had been painted with white lead outside and black preservative paint inside when put up. In April or May when the staves seemed to be drying out, the hoops were tightened; and again, especially at the

Hillcrest Stock Farm.

Shorthorn Cattle, Shropshire and Merino Sheep

Shorthorn Bulls for Sale, sired by such noted bulls as King Lancaster, Knights Perfection, Greenwood Knight and Greenwood King. Nearly all offsprings of the famous King Edward.

These Bulls are conceded to be the best offering ever made from the Hillcrest Stock Farm.

bottom, when the silage was put in, both times as tight as possible.

Allow about half acre of corn per cow for usual silage ration.

Corn makes the best silage when ears are dented, or just when it is beginning to glaze.

Be sure that silage is packed well around sides.

Standard-Sized Pig Litters.

[Written for Pacific Rural Press.]

All breeders of even purebred hogs admit that there are usually one or more undersized pigs in every litter. Is this not due to the effort made by most breeders to raise sows which farrow more than they can suckle right?

It is not the number of pigs born per litter that counts (if there are enough) but the number that are alive and thrifty at weaning age, leaving the mothers in condition to breed again without injury and with little delay. Granting proper feed and housing conditions, a successful purebred Berkshire breeder of Sonoma county prefers not over 4 to 6 the first litter, though he has had 9. Size of litters increases up to the sixth or seventh, but even at maturity, anything over 10 drains the sow and puts her in bad condition for breeding. A Kings county Poland China breeder believes that anything over 8 per litter is too much and the least promising should be killed at birth. When there are more than eight, the stronger ones injure and starve the weak ones, so they are likely to be underdeveloped anyway. These are a disadvantage because they waste the sow's strength, both in bearing and in

suckling her over-large litter.

It is better to have stock whose ancestors have consistently farrowed and raised 8 or 9, though a Stanislaus Duroc breeder claims that the daughter of a sow having only 8 is likely to have less. He wants as big litters as he can get, and allows a dozen pigs per sow "if she can do them justice." A Colusa county Berkshire breeder says that 8 are more profitable than 12, but notes that some sows alternate large and small litters, though "a good sow generally has over eight." A Glenn county Chester White breeder had a junior four-year sow which farrowed 12, 9, 15, 10, and 18 pigs in her first five litters respectively. He always kills all but 10, though he claims the sows can suckle as many pigs satisfactorily as they have teats for. He gives them a good start by not breeding to farrow under a year old, but he gets two litters per year.

Since 8 or 10 per litter are generally recognized as being all a sow can raise well under most favorable conditions, why should not breeders ask for consistent records of dams and grandams producing such litters, no more nor less?

Hogs Wait Till Troughs are Full.

[Written for Pacific Rural Press.]

When as a boy we used to wade through a million crowding, squealing, hungry shoats to empty a couple of bucketfuls of rich slop into a trough in the middle of the pen, we didn't get it all into the trough. A goodly portion was carried away on top of the biggest shoats' heads and some of it had spilled along the way. We had to kick the animals to make a path through them, and then the strongest shoats got the richest of the feed, for only the thin part of the slop would get past them to the smaller ones that ought to have gotten the best of it.

So it was with pleasure that we recently noted the system on the Cloverleaf Ranch in San Pasqual Valley, San Diego county, for it avoided all such waste and annoyance.

The pens all face a central alley down which the feed can be hauled by horse power. A panel in the

front end of each pen about 3x14 feet is hung from its upper corners by horizontal pegs into good posts so that the panel swings on the pegs. When it hangs sloping outward, the panel is flush with the outer edge of a trough of equal length, and is held there by means of a 1x4 slide which fits into a socket fastened to the trough.

Some time after each feed, this panel is swung inward and the slide catches over the inner edge of the trough. This keeps dirt out; but more important, it keeps the hogs out while slop and feed are distributed evenly and at leisure in the troughs.

To avoid the mudhole which often accompanies fixed troughs, wooden feeding floors have been placed in front of them.

CHUTELESS SILOS.

[Written for Pacific Rural Press.]

Chutes on silos have their disadvantages besides often being inconvenient to climb in. Where a great deal of silage is used, and one man attempts to handle it, the chutes sometimes would fill up before enough has been thrown out. It also takes more lumber and time to put chutes on two silos than to fix it as G. R. Cloes of San Diego county has done. The silos are 36 feet high and 10 feet apart. They were turned so their doorways would come in the corner where a straight board wall connects the two all the way up and on the opposite side from the barn. This is to prevent the silage from being scattered by wind when thrown down.

An impervious layer resulting on the top of a filled silo makes a cover unnecessary.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.
M. BASSETT,
Box 1, Hanford, Cal.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

On account of the rain, prices of dairy cows are getting stronger, notes our Fresno county representative.

A Hughson dairyman was recently fined \$25 for keeping an insanitary dairy after being notified to clean up.

The Gotshall Cattle Co. herd is now housed in its finely equipped ranch near Ripon and has only purebred Holsteins.

S. G. Gambonini of Petaluma has recently received a highly bred Holstein bull from the East to improve his grade herd.

The Tulare Co-operative Creamery has been sold to the Los Angeles Creamery Co., which has been operating it several months.

An amendment before the Legislature is to make the dairy law apply to milk used for butter, as it was intended when the law was passed.

The California Creamery Operators' Ass'n is urging cow testing associations to increase the output without increasing the costs of production.

The junior three-year Holstein Uniform Lorena, owned in New York, has broken the record with 528.4 pounds milk containing 29.983 pounds fat, in seven days.

The Napa-Sonoma Cow Testing Association is now testing 1500 cows. This association, which was formerly in Napa county alone, has been operating five months.

Senator Underwood is proposing in Congress a flat tax of two cents a pound on oleomargarine instead of the 10 cents on colored and ¼ cent on uncolored oleo now imposed.

Seven Holsteins with official productions above 27 pounds fat in seven days, two of them above 35 pounds fat, are reported Feb. 19 by Malcolm H. Gardner, Supt. of Advanced Registry.

Unlawful combination in restraint of trade in eight northern and western States is charged in a federal indictment returned Feb. 24 against 8 corporations and 11 individuals handling dairy products.

The Bodega Co-operative Creamery of Sonoma county is making 1100 pounds of butter a day, but expects to increase this amount to a ton a day as soon as feed conditions become more favorable in that section.

The formation of a new cow-testing association in the Nicasio district of Marin county is well under way. It is expected that the new association will start with 1000 or more cows, as 700 head were signed up at the first meeting.

"Those dairymen who are going to be prohibited from holding dairy licenses may still sell to creameries where the milk is pasteurized, but will not be allowed to sell it at retail," announces Dairy Inspector J. H. Severin of Stanislaus county.

The Holstein heifer Jewel Pontiac Segis, owned in Minnesota, has broken the world's record in the junior two-year-old class with a record begun 335 days after freshening. She made 473.6 pounds milk with 22.07 pounds butter in seven days.

The Pt. Reyes Co-operative Creamery now has 134 patrons and 87 members located all the way from Occidental to Geronimo. They made a total of 1,100,070 pounds of butter last year and expect to materially increase that amount the present year.

Eighteen cows produced over 45 pounds fat in January in the Orland Unit of the Glenn County Cow Testing Ass'n and 28 produced over 50 pounds in the River Unit. Seven of these produced over 60 pounds. J. W. Craig's Holstein produced 78.9 pounds.

Old dairymen in the coast districts of Marin and Sonoma coun-

ties say there has been more feed shipped into that section the past year than during any three seasons in the past. The recent rains will overcome this situation, as the grass has already started to grow.

Stella of Venadera, the seventh daughter of a Register of Merit Jersey cow to be entered in the Register, began a test just under two years and has recently completed a record of 327.37 pounds fat from 5352 pounds milk. The mother of the seven daughters is still in the Guy Miller herd at Modesto.

The second carload of cheese has been shipped to New York from Modesto. It contained 25,000 pounds valued at \$5,000. New York used to be the leading cheese State of the Union and California used to produce what was considered about the worst cheese there was. Now we add the freight for 3,000 miles to New York's producing cost and compete with her at home.

SHEEP AND MISCELLANEOUS.

Buyers in the country have paid \$7.25 for spring lambs during the past week.

W. E. Price of Concord has rented 200 mules to contractors for use on irrigation work in Arizona.

It is said that after March 17 squirrel and coyote scalps will cease to draw a bounty in San Luis Obispo county.

A sheepskin-covered tin trough with rubber nipples is used by J. D. O'Grady of Dixon as a mother for motherless lambs.

March 3 is the date for the big community auction sale at Ripon when farm machinery and produce, from spray pumps to hens and livestock, will be sold.

The Frank Meacham Est. reports the sale of 25 purebred Merino ewes to J. W. Brauer of Shasta county and a purebred Red Polled bull to John Monte of Wadsworth, Nevada.

It is said that W. H. Moffatt of Nevada has bought about 200,000 lambs yet to be born, by paying \$1 per head in advance. They are to be delivered in September and October when Mr. Moffatt hopes to get about \$8 each for them, or more.

SWINE.

A hog in Tulare county recently died from rabies.

The highest price for hogs on the Chicago market since the Civil War was \$12.95, paid Feb. 21, 1917.

Harry Sickles of Springville, Tulare county, has just sold 480 hogs averaging 210 pounds at 11 cents a pound.

Two carloads of stock hogs were shipped from Riverside to Idaho Feb. 19 to be fattened for Eastern markets.

A four-months Berkshire boar sold for \$1,000 Feb. 22 at the American Berkshire Congress sale at Purdue University, Ind.

C. R. Windeler of Concord has bought the Pleasant Hill Stock Farm's herd of Hampshire hogs, thereby adding considerable to his already established herd.

The National Duroc Ass'n has offered a silver trophy for the best Durocs to be shown at the Napa County Fair the week following the State Fair at Sacramento.

R. L. Thompson of Oakdale has sold a car of hogs for \$1500 which gained three pounds per day apiece for the eight days the 77 hogs were fed steamed rolled rice.

Eighty-five hogs have been shipped from Imperial county to Kansas City at 10 cents a pound to be used for cholera serum. They were eight months old and weighed 212 pounds each.

AN IDEAL Green Feed Silo Insurance Against Drought

Now is the time to provide against shortage of green feed during the coming dry season.

The losses sustained by many dairymen last year could have been avoided if they had installed a silo early in the season.

Good Ensilage Increases the Milk Flow 25% and Reduces Feed Cost 15% to 20%.

AN IDEAL GREEN FEED SILO will give you longer service, a better quality of silage, and more profit on the investment than any cheap silo. This has been proven by the experience of many farmers who have tried both.

Better Design, Best Materials, Fine Workmanship are embodied in **IDEAL GREEN FEED SILOS.**

Our complete Silo Catalog and Dairy Hand Book give valuable information on ensilage feeding. Send for them now.

The light running

Acme Feed Cutter and Silo Filler

Built in seven sizes.

All steel frame.

Low Feed Table.

Malleable Knife Head

Positive Safety Device

Triple Frame Construction

Accurate Knife Adjustment

Automatic Feeding Device

Reversible Feed Rollers.

Saving Money on Dry Feed with an Acme Cutter.

The waste of feed caused by cattle nosing out the coarse hay can be saved by running it through an Acme Feed Cutter; so that all of it will be consumed. This waste is usually from 20% to 25%. With alfalfa at \$12.00 per ton a net saving of \$3.00 per ton can be made.

The Acme Alfalfa Meal-Making Attachment can be fitted to all sizes of Acme Feed Cutters. It enables the making of an excellent grade of alfalfa meal from alfalfa hay at a cost not exceeding that for baling.

Catalog describing all sizes on request.

BEEF CATTLE.

J. J. Hogarty is the newly appointed Alameda County Livestock Inspector.

Owing to high water in the Sacramento river Sunday, probably 100 head of cattle were drowned and Van Sickle island was inundated.

Starving cattle in the Livermore mountains generated a dispute with the Humane Society, whose superintendent was unable to find them.

At the annual student stock-judging contest at Ore. Agr. Col. Feb. 17, the first two prizes went to students from the great stock regions of Eastern Oregon.

The hide-and-brand bill now in the State Legislature has been highly endorsed by the California Cattle-men's Protective Ass'n. It provides for inspection of stock at shipping or killing.

W. M. Carruthers reports that he has a letter stating that F. W. Harding, secretary of the American Shorthorn Association, will attend the Carruthers Farms sale on May 2d, at Mayfield.

The 20th annual session of the American National Livestock Ass'n convened at Cheyenne, Wyo., Feb. 24, to discuss national forest range rates and also a proposed investigation of the meat industry.

KINGS COUNTY POLAND SALE.

The third semi-annual sale of the Kings County Poland China Breeders Ass'n to be held Mar. 7 on the County Fair Grounds proves that the previous sales have been carried on to the satisfaction of local buyers who know the consignors personally, as well as to the outside buyers who have freely patronized the sales.

The consignors for this sale are the well known long established breeders: M. Bassett, W. Bernstein, J. A. Crawshaw, T. J. Gilkerson, F. D. Ross, W. D. Trehwitt, J. M. Bernstein and Oscar and Clarence Dimmick. If you want to start in purebreds get the best you can for a foundation. Select not only fine individuals, but those whose pedigrees contain well-known prize winners showing they are of families that transmit their good points. Study the pedigrees from catalogs, which may now be had from F. E. Newton, Hanford.

At one year of age the bull should be ringed for convenience in handling.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Jim Jeffries, Purebred Stockman.

[Written for Pacific Rural Press.]

The soft-voiced, mild-mannered prize-fighter farmer is laying the foundation for economical record-making by the herd of high-priced typy registered Holsteins accumulated last fall. Jas. J. Jeffries is not new at farming, for he still has over 40 of the grades which had been producing a dairy income on the ranch at Burbank before the purebred venture took shape.

But it is the purebreds in which he takes pride; and, with Ted Cameron in charge, he expects to begin

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Coulson Poultry & Stock Food Co., Inc., Petaluma.

BAKER'S TRACELESS HARNESS

Best plow rig. No whiffletrees—no traces. Handiest farm harness.

Indispensable in the orchard with special fitness for all low down work. You can hitch closer to your load, plow and cultivate close to the row and save all the worry to man and team. No weight of whiffletrees for man to lug. Everything clear behind team. Use our outfit and save your trees. Highest endorsement of farmers and fruit growers.

Write now. B. F. BAKER CO., NUMBER (1220) MAIN ST., BURNT HILLS, N. Y.

BROWN & DYSON,

640 So. Center St., STOCKTON, CAL.

official record-making along in April. He has 49 purebred Holsteins, of which about 28 are from Wisconsin, while most of the rest were obtained at the Rhoades-McAlister and the Baldwin ranch sales. Most of these are heifers just now coming in. Nearly 40 head are bred to King Segis Pontiac Jannek, which has so many high records in his pedigree and shows such fine type. The big cow Novelty Pauline the 2nd, bred to King Segis Pontiac Jannek, is due to calve not long hence, and will be one of the first to go on official test. She already has a record of some 30 pounds. Fourteen of the Wisconsin heifers are expected to make a great showing.

Much of the stock was thin when received, and the several months of good feed and care are putting the animals into fine condition for record-making.

Economy of Production.—It was long ago that A. W. Morris said it was better to put your capital into stock; and invest in equipment for only cleanliness, convenience, and comfort of the stock. This policy is being followed by Mr. Jeffries in that the buildings and equipment are built for commercial purposes only. The new barn being built for cows on official test is to be simple and comparatively inexpensive.

Concentrates will have to be purchased, for the 105 acres in the ranch are to be used for alfalfa and corn silage only. The corn silage experience of last season was particularly gratifying. A 260-ton cement silo was built to take care of the crop from 22 acres, but it was soon seen that another of the same size must be built. These were filled and on Lincoln's birthday $\frac{3}{4}$ of the silage still remained. Some 60 or 70 of the 105 acres in the ranch are to be in alfalfa this season.

SILAGE NOTES.

Forage placed in the silo keeps at a uniform quality whereas field-cured forage constantly deteriorates.

Silage can be used in summer and fall to supplement or take the place of pasture.

Silage greatly increases the milk flow during the winter season and decreases the cost of production.

In filling the silo with oats or wheat the air in the hollow straw must be driven out by water before the crop will keep.

Clover or alfalfa heat more than any other silage crop and must be given plenty of water.

To obtain the best feed from the silo, feed off from two to four inches each day.

Corn yielding 30 to 40 bushels per acre will make about 7 or 8 tons of silage. Fifty bushels will make ten tons or more.

Since silage is strong in carbohydrates, alfalfa is usually fed with it to balance.

Construct the wall of the silo so that no air or water is admitted. It must be perpendicular on the inside. Make the foundation deep enough and strong enough to prevent the walls from settling or cracking. If the silo is made of concrete the inside wall must be painted every

Remco

SILOS TANKS

For dairymen, farmers, feeders in all sizes and proportions.

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

PIPE

Redwood for Durability.

Are Your Cows a BURDEN?

Many cows are a constant drag on their owners when they could just as well be good producers—if properly handled.

Don't forget that your cows can get physically "off color" just as you sometimes do. Watch the milk yield; if it is going down without apparent reason, something is wrong with the cow. Overfeeding is likely to make the condition worse; she needs a medicine that will clear up and strengthen her organs of production.

Kow-Kure is making thousands of new friends among the best dairymen every year, because it supplies this great need. It is a cow medicine, pure and simple—not a food. It has great curative and tonic powers that immediately act upon the digestive and genital organs and enable the cow to thrive on her natural food. Kow-Kure has back of it twenty years of success in making backward cows profitable and in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from the best feed dealers and druggists. Sold in 50c. and \$1.00 packages.

Raising Poultry for Profit

FEEDING THE BREEDERS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Next to having good parent stock, the question of proper feeding is the most important in the whole range of hatching and raising the chicks to a profitable age. I say this with a full knowledge of all the questions that can be hurled against it, because I have proven it—not once, but several times.

If the breeders are fed right, the eggs will stand more abuse in the variations of heat in the incubator, and when hatched the chicks are hardier, healthier, and have a much better hold on life than if hatched from stock that have been improperly fed.

The press, the poultry associations and the State are all busy sending out information to those who are willing to receive it; and knowledge can only be imparted to those who want it and are ready for it.

Quality, Not Quantity.—In feeding hens that are intended as breeders, the one thing to remember is not that you want the greatest number of eggs each hen is capable of laying, but to feed so that every egg she lays will contain a strong germ, not only from the male, but also from the hen. But we must have something more than fertility, or we can never raise many chicks. I have known cases where they had an 80 per cent hatch and did not raise 10 per cent of the chicks. The cause was improper feeding of the breeders, or feeding for "quantity" and neglecting "quality."

A short time ago I told you to select your breeders from the best layers. Now I add to that: don't force those good layers to lay all the eggs they are capable of laying, any more than you would put out all the strength you were capable of to do some job that you would have to repeat day after day for a long season without rest.

Vital Energy.—The people that claim a hen is a machine are correct in one way, and that is, that if she is built right and fed right she can be forced to produce to the limit. But if she lays eggs up to her capacity of production, she can't possibly charge each egg with enough vitality to bring the chick through the stage of danger.

Difference between Fertility and Vitality.—Nature is so generous in all phases of life that she endows every species with an abundance from which to propagate their kind. She allows for all kinds of waste and accidents; but she assumes no responsibility further. The question of fertility is provided for; that of vitality, which gives to each a chance to live, is left to "the survival of the fittest." The wise poultry man, therefore, feeds his breeding hens so that each egg is charged with a fertile germ from the male and great vitality from the hen, plus her own individuality or capacity for laying a certain number of eggs.

How to Feed.—Feed little if any mash of any kind. I prefer none for best results, but a little is sometimes needed to give appetite. Feed

very little green feed and that not of a watery nature—plenty of sprouted oats with sprouts only $\frac{1}{4}$ inch long thrown in clean litter for breakfast, wheat at night thrown in litter, and hens made to dig for it. Sour milk can be given, but not sweet milk; and granulated bone can be fed in the litter like wheat; also gyp or Kaffir corn in small quantities, but no Eastern corn. Plenty of wheat, a little bone, grit, oyster shell and sprouted oats, with sour milk or buttermilk makes an ideal feed for breeders. You may coax the males aside and feed a little fresh meat, but don't feed it to the hens. Hens fed this way will lay all the eggs they can endure with vitality, and they are the only kind that pay to hatch. I don't say starve hens, only "don't force or stimulate them."

QUESTIONS AND ANSWERS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Rabbit Growing.—Where can I find out about raising rabbits, and the names of the breeds?—C. L. T., Calistoga.

Ask the public Librarian at Calistoga for such books or write to F. H. Snow, Petaluma Poultry Journal, Petaluma. He sells a rabbit book.

Chicken Ticks in Vacant Premises.—Will small chicken ticks live and infest birds after premises have been vacant? Will moving houses and plowing the ground rid the place of them?—C. B. L.

Vacant premises merely whet the appetite of these pests. Plowing and moving will help. Spraying the houses with a strong solution of crude oil and crude carbolic would be better; but unless you reach every spot under boards and roof, burning the houses would be cheaper and certainly safer.

Chicken Growing.—I am planning to enter the chicken business. Where can I get information on raising and feeding chickens for layers? Can baby chicks be raised successfully with a fireless brooder?—L. D. C.

Send a dollar to Pacific Rural Press for a copy of "California Poultry Practice" which gives full instructions for beginners. Chicks can be raised successfully in fireless brooders, but a little heat at first gives better results.

WHEN TO HATCH FOR BEST RESULTS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The first eggs of the season used for hatching may be relied on to produce strong, healthy chicks, but if hatched too early the pullets become over-developed and molt very early, then go into another molt. I have had best results in hatching the heavy breeds from February to last of April and light breeds from March to May. The pullets hatched between those dates will be your most reliable unless you have plenty of shade and water, in which case the successful period will last much longer, as these two things are the only drawbacks to making our hatching season an indefinite one. But if you cannot provide shade,

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta.

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from \$15 to \$20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near \$2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

HOPLAND STOCK FARM, POULTRY DEPT.

White Leghorn and White Plymouth Rock Cockerels. White Leghorns and White Rock Baby Chicks hatched from specially selected heavy-laying stock. Prices same as last season. White Leghorns, January and February delivery, \$12.50 per hundred; March, \$10.00; after April \$10.00. Write Plymouth Rocks, \$15.00 per hundred. All F. O. B. Hopland.

San Francisco Office,

1210 Flood Bldg.

pullets hatched after these dates will not develop as well as they should do, consequently will not be so profitable.

The unusual high price of feeds last year did not reduce the output of Petaluma eggs as anticipated. On the contrary, shipments of eggs for 1916 were greater than those of 1915 by 1,420,378 dozen; and poultry showing a gain of 26,427 dozen.

The Postmaster General states that shipments of eggs by parcel post may be insured and sent C. O. D. For some time the impression has been abroad that eggs must take their own chances without insurance.

Your Eggs

Do They Pay Dividends?

They would if you hatched them in a MODEL INCUBATOR and raised the chicks under a Model Hover. These machines are guaranteed result-getters.

Incubators, \$10 to \$48. 100% hatches three consecutive times. Coal-Burning Hover, \$15. International Sanitary Hover (Oil-Burning) \$10.00. Model Machines Have All Latest Improvements. **FREE BOOK** tells all about them and gives profit-making advice of experts.

LASHER'S HATCHERY, PETALUMA. Write for booklet, "The Day-Old Chick Business" and price list.

PIGEONS—Choice Carneaux, \$1.50 pair. J. W. Noble, Box 513, Livermore.

"SWELL HEAD" IN TURKEYS.

To the Editor: Can you give me a remedy for "swell head" on turkeys? Large swellings containing water form under the eyes. The fowls eat well but do not gain in weight.—A. A. K., Woodland.

[Answered by Geo. H. Croley.]

[In the absence of any further information contained in the above we believe that these turkeys are not receiving a proper variety of feed. They would hardly eat well if suffering from a serious disease. The system being out of order probably opened the door for a serious cold. We would recommend cleansing the head and eyes with a weak solution of a good disinfectant such as listerine or peroxide of hydrogen and give the turkeys a great variety of grains, including some cracked bone and possibly a very small amount of meat.]

The annual report of the Tulare Co-Operative Association states that during 1916 the Association marketed \$78,000.00 worth of poultry and eggs as against \$53,000.00 during 1915. The average price received for eggs during 1916 was a trifle under 30c a dozen, while in 1915 the average was 26c a dozen. In behalf of its members the association has placed orders for more than 100,000 baby chicks for delivery this spring.

All mash feed for fowls, whether dry or moist, should be salted, using only a very small amount of salt.

ANCONAS—Prize winners everywhere exhibited. 35 first prizes in last two years. Catalogue free. T. E. Silva, 3620 Grove St., Oakland, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

FURNITURE FASHION SHOW.

(Continued.)

My Dear Friends: Last week I told you of the Furniture Fashion Show and this week I am going to continue. Several bedrooms were portrayed in various shop windows and all were interesting. Some had matting covering the floor with small rugs carrying out the color idea, while others had a large central rug on a bare floor. Rugs for the bedroom are very pretty now. Rag rugs in dainty colors are popular for the small rug, and as they can be washed, they are very hygienic. Rugs are also woven into big rugs with a fancy border of flowers, which gives it a festive air. Other pretty bedroom rugs are of Brussels in soft shades with pretty borders of contrasting colors or dainty all-over patterns.

The enameled bed of simple design is popular now. It is seen in plain cream and gray as well as decorated and with cane inserts.

Several different designs for bed covers were shown that could be made at home and would wonderfully dress up a room. One was of simple dimity that filled the top of the bed having sides gathered and applied by a small heading that hung six inches from the floor. A bolster was covered smoothly with the same material and finished the bed. Other covers were made in the same manner, but were more elaborate. One was of net with two strips of applique 12 inches in from the edge and corresponding strips on the bolster. One was of sheer linen, embroidered simply and another was of the popular filet lace squares combined with net, but the squares were not arranged in alternate strips as is so popular, but formed a square in the middle of the cover. The bolster carried out the same idea.

For a girl's room, if you wish to use cretonne freely, a design that is easily cut out is pretty applied on to a white cover. Some girls even have the whole cover of cretonne. Such a cover, which is removed at night, does much to freshen and change a room.

The old-fashioned chest of drawers is modish now in the bedroom, and yours is not the right color, try painting the dresser, chest, bed and chairs all the same color, finishing by enameling them. That will give you the best background for refurbishing your room. For instance, if you have a gray wall, paint your furniture gray — fashionably called French gray — then have chintzes or cretonnes at your windows that are gay with rose. Make a rose cover for your couch, if you have one. Cut out patterns from the cretonne to applique on to sofa pillows of black, gray or neutral backgrounds. Articles on your dresser may stand a touch of cretonne too. Hunt up a candlestick for the chest of drawers, place in it a pink candle and you will have added a finishing touch to a vogue-like room. Yellow and black, with white furniture, provides another color scheme and bright blue and pink are very effective in combination.

But be sure you eliminate bric-a-brac. Put away things that are not

THE HOME CIRCLE

planned for a scheme, or chaos will result. These new color schemes in their brightness demand a neutral background. Use the primary colors sparingly and with judgment.

The bath rooms now are equipped with white tile floors, pedestal wash bowls, hand showers, glass rods with nickel fixtures for towels and white bath seats that fit on the sides of the tubs with white rubber-covered hooks.

The out-of-doors calls in the spring time and although it is too early to move into the garden, the shops show gay things for a glassed-in porch. The brightly painted furniture is now in vogue and one shop window was finished in a canary yellow set of furniture that had black and green figures decorating it. There was a comfortable Morris chair and low table with the current magazines and reading lamp on it. There were squat rockers and prim little stiff-backed chairs. There was also an old-fashioned sewing table and a low table holding a gaily painted glass bowl in which gold fish swam contentedly about. And there was also the gay bird cage, standing on a pedestal seven feet tall.

There was a tea wagon too, and one that had a new idea. The space between the upper and lower trays was enclosed and when opened disclosed hooks for cups. This space affords a fine place to keep sandwiches or cakes from curious flies or interested children. In front of a long low couch, decorated by bright pillows, was a darling footstool of the same painted wood.

This was an altogether interesting place. It looked homelike, and as though it would be enjoyed by every member of the family.

Rosabella Best.

MACARONI RECIPES.

The Globe Mills of Los Angeles recently published a booklet giving many prize recipes for the use of macaroni. Many of them can now be used to advantage, in making this dish take the place of potatoes or other vegetables at dinner. Here are several practical dishes for farm wives to try:

Baked Macaroni Pudding.—Boil 20 minutes in quickly boiling water 1½ cups macaroni, strain and turn into deep earthen pie dish well buttered, add 3 eggs well beaten with 1 tablespoon sugar, grated rind ½ lemon, 1 pint new milk, stir well, shake little nutmeg on top, bake in moderate oven one-half hour.

Italian Spaghetti.—Half-box spaghetti, 2 tablespoons each chopped onion, chopped, fresh, green, sweet pepper, 2 ounces butter, 1 pint

cooked and strained tomato, 4 ounces grated cheese, 1 teaspoon each salt and sugar, ½ teaspoon grated nutmeg, dash cayenne pepper. Break spaghetti into pieces, put into 2 quarts boiling water, add 1 tablespoon salt, boil 25 to 30 minutes, stirring occasionally to prevent burning, drain and leave in cold water 15 minutes. Drain, place in dish and pour over it following dressing: Melt butter in saucepan, add onion and pepper, cook 6 minutes, add flour and tomato, stir until it boils, add cheese, seasoning and mix together thoroughly. Pour over spaghetti, place in oven few minutes and serve. May be prepared beforehand and heated quickly in oven when needed.

Macaroni and Salmon.—Boil one-third package macaroni in slightly salted water, when tender drain and throw into cold water. When cold, cut into small pieces, add 1 can red salmon, seasoning with pepper or paprika. Make white sauce with 1 tablespoon each melted butter and flour, stirring in 1¼ cups milk. Put into baking dish alternate layers of macaroni, salmon and white sauce, put buttered bread crumbs on top, bake 20 minutes or half hour. May be filled into ramekins and then baked.

AN ENGAGEMENT TABLE.

Anyone interested in engagement parties could not help but be enthusiastic over the attractive table for an engagement luncheon shown at one of the silver stores recently. The table was square and covered with white linen and set with the necessary china and silver.

At each of the four corners were big, fluffy bows of pink tulle from which extended tulle streamers of pink up over the table until they met in the center forming a big bow over two suspended white doves.

From the doves were hung streamers of blue and pink artificial forget-me-nots to the goblets of each guest. Narrow blue velvet, wired to make it stiff, was made into perky bows at the end of the streamers and also bows were carefully placed within the tulle bows on the corners. In the center of the table was one of the new flat bowls in bright blue holding pink rose buds and a china butterfly was perched on the rim of the bowl.

The place cards were pink hearts on which stood kewpie dolls dressed in bright taffeta and tulle.

The dishes were decorated in blue with the service plate having a pink band that carried out the color scheme. The table was dainty in coloring and really simple in execution if the details were finished before putting it together.

CARE OF THE SKIN.

As the spring comes in with its winds and more being out-of-doors, the skin must have more attention, or it will show the effect of neglect. Too much contact with the sun is bad for the complexion, and should be counteracted by the use of cold creams or softening fluids. The use of powder will sometimes prevent sunburn, and is always an improvement to an oily skin. It should be applied, however, in a bright light, in front of a mirror, and not be hastily dabbed on with perhaps a heavy coating left on the eyelashes, or a well-defined line between face and neck.

Floral Department.

[By Geo. N. Tyler.]

TIMELY SUGGESTIONS.

Owing to the heavy rains there is very little to do in the garden. After the soil has dried out a little use the hoe and rake, and cultivate and rake till you have a fine surface. It conserves the moisture and prevents the baking of the soil. You can plant out carnation plants now, also Watsonias and gladioli, also a large number of the hardy annuals and perennials. A few bulbs can still be planted.

I would advise my readers to grow single and pompon chrysanthemums. They require very little care with the exception of abundance of water in the hot summer months. Plant them as soon as you can get the plants; divisions are best, but early struck cuttings are almost as good. They require rich soil and after they are established should be pinched out to make them branch and keep on pinching out till July, then let them make their flower shoots. They require full sun and shelter from heavy winds, also they should have one good stake to tie to. Eighteen inches apart is close enough to plant them. They should make from thirty to fifty flower shoots, and in the fall from October on give a wealth of bloom for a month or six weeks. They are fine for cut flowers. I have kept them for a month in the living room of a house.

It is too early yet to start with the large chrysanthemums. I do not start propagating till April 1st unless I am short of stock of any particular kind. Do not under any consideration plant divisions if you want large flowers.

Fresias that were started in August are now in full bloom. If in pots put them in a cool place and it will greatly prolong the blooming period. They require abundance of water at the root, and should not be allowed to form seed pods.

Your house plants from now on will require more water and the leaves should be wet at least once a day on bright days. And do not from now on let plants have the direct rays of the sun. Let the sunlight be filtered through lace curtains or half-curtains. It is also time to repot those that need it. If in large pots, two inches of top soil can be removed and fresh soil be added with a little bone mixed with it. You can now start hanging baskets.

Many scientifically arranged kitchens are having most of the utensils displayed on shelves easy of access.

SEEDS AND WORDS.

I dropped a seed beside a path,
And went my busy way,
Till chance or fate—I say not
which—

Led me, one summer day,
Along the self-same path; and lo!
A flower blooming there,
As fair as eye hath looked upon,
And sweet as it was fair.

I dropped a sympathetic word,
Nor stayed to watch it grow,
For little tending's needed, when
The seed is good we sow;
But once I met the man again,
And by the glad some way
He took my hand I knew I sowed
The best of seed that day.

—Selected.

TELL THE TRUTH.

The clock stood on the kitchen shelf in the old farmhouse, where it had stood for many a year. It had always been a good clock until the summer the farmer and his wife adopted Sarah Jane and she came to live with them and be their little girl Sally.

"If we call her Sally," said the farmer's wife, "she may forget that she was nobody's little girl all her life until we went to the Orphans' Home, and loved her!"

The old clock, perhaps because it was filled with wonder, stopped ticking the minute that Sally stepped into the kitchen and with hands behind her gazed upon it and said, "What a beautiful clock!"

"Well, well!" exclaimed the farmer, "I do believe we were thinking so much about our little girl we forgot to wind the clock!" And then he wound it and wound it, and the clock said, "Tick-tock, tick-tock, tick-tock," solemnly, as if it were a church clock and had always done exactly right.

The next time the old clock stopped was the day Sally stood before it and said, "O Clock, why do you send me to bed so early in the beautiful country? Mother says, 'Eight o'clock is bedtime, Sally,' and almost right after supper, it seems to me, you say, 'One, two, three, four, five, six, seven, eight o'clock,' and then, away I go to bed!"

That night, after the supper dishes were washed and put away, the old clock hushed its tickings and would not let its short hand point to V three I's—eight, and would not allow its long hand to point straight up. Instead, the long hand pointed straight down, so that when the farmer's wife thought it was Sally's bedtime and stepped to the kitchen door to look at the clock, she was surprised.

"Why," said she, "the clock says half-past seven! You may sit up half an hour longer, Sally." Such a joyful time Sally had that evening, singing on the porch and watching the golden sunset!

In half an hour, when mother again stepped to the kitchen door and the clock would not tell the time as it should, but still said, "Half-past seven," mother spoke severely. "Clock," said she, "you are not doing right! Father, please look at your watch and then make our old clock tell the truth!"

After Sally kissed her father and her mother good-night that evening, and before she went skipping up the stairs to bed, she threw a kiss to the old clock. After that, the clock behaved worse than ever. It stopped

ticking any time it chose to keep still and hold its hands.

Then came the Friday night after school when Sally looked up at the old clock and said, with tears in her eyes, "Old Clock, Old Clock, what do you think? Melissy Brown is going to have a party tomorrow, a come-in-the-morning-and-stay-all-day party, and I never went even to a short one in my life, because I used to be an orphan. I want to go. But Old Clock, Old Clock, mother is going to take me to the city tomorrow morning on the nine-thirty train, to buy me warm underwear and a new school coat, and so I cannot go to the party. Old Clock, Old Clock, I'd rather shiver!"

"Tick-tock, tick-tock, tick-tock," answered the clock in staid and mournful tick-tocks.

Next morning the farmer's wife arose early and worked and worked, to get the Saturday churning and baking and cleaning done, and dessert for Sunday dinner, before train-time. Once in a while she looked up at the old clock and listened to its solemn "tick-tock, tick-tock, tick-tock," and at half-past eight she called the hired man and said, "You may hitch up now and drive Sally and me to the station."

"Aren't you a bit late in starting?" inquired the hired man.

"No," answered the farmer's wife, "there is plenty of time. Come, Sally, let me see if your shoes are black and your fingernails clean."

But when Sally and her mother reached the station they learned that the train on which they expected to go to the city had been gone seventeen minutes by the honest station clock.

"That old clock of ours was slow!" exclaimed the farmer's wife, and she was so provoked! Then she smiled. "But my little girl shall go to Melissy's party, after all," said she, and she kissed Sally.

There was a change in the weather that day, and it grew so cold by night that when little Sally came home, she was wrapped in Melissy Brown's mother's blue-and-green plaid shawl, and she had to be so careful not to let it drag—had to hold it tight—just so!

"I had a beautiful day," said Sally to the kitchen clock that night, "but really, Old Clock, Old Clock, I do need that warm, new underwear! Mother is right and you were wrong this morning not to tell what was true about the time."

After that, the old clock would not tick a tick. The next Saturday, when Sally and her mother went to the city for warm, new underwear, the farmer went too, and tenderly carried the old clock to a jeweler to find out what was wrong with its conscience; and that kind jeweler knew how to make it tell the truth ever after.

"Old Clock, Old Clock," said happy little Sally that night, "mother loves me and mother loves you, and father loves you and father loves me. I think, after this, that you and I had better be good and always tell what's true."

Sure enough, they did, which may be the reason that in that old farmhouse there lives to this day such a happy family.—Frances Margaret Fox.

Truth is never shame-faced.

The New Model 3A BROWNIE

Here is a new camera for pictures of the post card size, (3¼ x 5½ inches). Manufactured under experienced superintendents by skilled mechanics with whom honest workmanship has become a habit, it has quality. Designed by the men who have helped to simplify photography, manufactured in the largest, best equipped and best organized camera factory in the world it has been possible, through quantity production combined with high efficiency, to produce this camera of real quality at a low price.

It has the new Brownie Ball Bearing shutter, with cable release, having both time and "bulb" actions and snap-shot speeds of 1/25, 1/50 and 1/100 of a second and is equipped with Kodak Autotime Scale as an aid to correct exposure.

Loads in daylight with ten, six or two exposure cartridges, has automatic focusing lock, reversible finder, two tripod sockets, genuine leather bellows, is constructed of metal throughout and is covered with a durable and attractive imitation leather of the finest quality. With its black enamel fittings it is a handsome as well as an efficient camera.

It is autographic, of course, all of the folding Brownies and folding Kodaks now incorporate this valuable feature by which you can date and title each negative *at the time of exposure*.

threads of the garments and after being ironed is not so noticeable. It is also hard to mend an ironed garment without giving it a mussy, soiled appearance.—Mrs. J. G., Selma.

Good Health.

[By H. E. Pastor, M. D.]

An Achievement in Sanitation.

The Pacific Rural Press has received an interesting and important circular letter from the California State Board of Health, which we take pleasure in reproducing as far as space limits permit. It may not be commonly known, though it is so generally regarded by the medical profession, that the typhoid fever death rate of any community is a pretty fair index of the sanitary conditions prevalent in that community; and the reduction of typhoid fever mortality in this State from 13.6 per 100,000 population in 1914 to 7.1 per 1000 in 1916 is a highly creditable achievement for our State Health Board, which has much to contend against, here as elsewhere, in the way of ignorance, prejudice, and indifference, and as a rule inadequate funds for prosecuting its work. The circular says, in part:

In 1915 the California State Board of Health declared its intention to reduce the typhoid fever death rate from 13.6 per 100,000 population (the rate for 1914) to 9.6 per 100,000 population in 1918. However, this declaration was nearly fulfilled in the year 1915, when the rate was reduced 9.7 per 100,000 population. And now, the typhoid death rate for 1916 is 7.1 per 100,000 population, lower than the Board hoped it would be in 1918. If the measures employed in typhoid fever control are continued, and if the same co-operation of the people of California is received, the Board hopes to reduce the typhoid death rate to a point below 5.0 per 100,000 population in 1918. This may be accomplished through the prevention of sewage pollution of public and private water

supplies; the insurance of safe milk supplies through the pasteurization and inspection provisions of the State milk law; investigation of outbreaks of typhoid fever, determining and removing their sources; manufacture and distribution to physicians of typhoid vaccine; inspection of hotels, eating places, summer resorts and surroundings, and correcting insanitary conditions that may be present. To secure results, it is necessary that the California State Board of Health shall have the active support of health officers, physicians and citizens. All of the common rules of sanitation, particularly as related to sewage disposal, water and milk supplies, must be rigidly observed.

Syrup of Figs.

Editor Home Dept.: Will you kindly give me formula for making "Syrup of Figs" for purgative purposes?—E. J. H., Vacaville.

Syrup of Figs is a proprietary remedy which makes an appeal to the popular fancy that the fig possesses peculiarly valuable properties as a laxative. It is true that figs have mild laxative powers, but it is not true that "Syrup of Figs" owes its laxative effects to its fig content. The purging action of this nostrum depends upon the senna contained, in the form of an elixir, said to be about 25 per cent of the whole.

Barring its excessively disagreeable taste and odor, senna is a good laxative, and, in common with castor oil, is said to leave no constipation as an after effect—a serious drawback to most cathartics. The nearest official preparation to "Syrup of Figs" is Syrup of Senna, which has of senna 33 parts, sugar 60, alcohol 4 ("Syrup of Figs" contains 6 per cent alcohol), oil of coriander and water enough to make 100 parts. Flavoring with the juice of stewed figs would not be objectionable. The dose is from one-half to two teaspoonfuls.

It may also be said, incidentally, that senna is like castor oil in another particular—given to a nursing mother her milk acquires purgative properties.

Thinks It Is Cowpox.

Editor Health Dept.: We had a cow that I think had cowpox. As I do the milking I got the disease. I have consulted a doctor, also treated it myself, but do not get rid of the trouble. Can you tell me what to do?—M. R., Visalia, Cal.

If you got what you think you got, you were simply vaccinated cheaply and effectively. Cowpox, or vaccinia, is a disease occurring naturally in the cow and some other animals. It is communicated to the hands of the milker by inoculation. This particular form of inoculation is what we call vaccination, which protects the person so inoculated against the contagion of smallpox. Cowpox is a self-limited disease—that is to say, it runs a well-defined course, and ends. Aside from the fever and typical eruption, there is usually little constitutional disturbance, and the scab or scabs that form fall off in about three weeks. If the symptoms you complain of continue beyond this period you have not correctly diagnosed your case, and it would be well for you to consult a first-class physician in your neighborhood, as long-distance treatment is unsatisfactory.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

SAN FRANCISCO.

San Francisco, February 28, 1917.

WHEAT.

Nearly all grades of wheat have been advanced here this past week, with northern varieties leading in the upward movement. The Australian stock landed here the preceding week is reported to have brought \$3 per cental, a figure that will not encourage heavy future shipments. Northern Bluestem and Red were again offered here and sold very readily.

Sonora wheat	\$2.75@2.80
Northern club	None offered
Calif. club, ctl.	2.60@2.70
Northern Bluestem	\$2.95@2.97 1/2
Northern Red	2.95@2.97 1/2

BARLEY.

Heavier spot trading, especially in seed stock, has firmed up local prices this week and fancy seed is bringing as high as \$2.75 per cental.

Seed, ctl.	\$2.50@2.75
Shipping, ctl.	2.35@2.40
Brewing	Nominal
Choice feed, ctl.	2.25@2.30

OATS.

Fresh arrivals of Texas feed stock brought somewhat easier prices on this offering during the week and white oats continue hard to move. The sale of one good sized lot for export to Central America featured this week's market.

Red feed	\$1.85@2.00
White	2.02 1/2@2.05
Red seed (Texas)	2.90@3.00

CORN.

More plentiful supplies of Eastern corn were responsible for easier quotations on California sacked this week and the top price on general trading has been \$2.22 1/2 per cental.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, ctl., bulk	\$2.15@2.22 1/2
California, sacked	2.20@2.22 1/2
Milo Maize	2.00@2.20
Egyptian	2.25@2.50

BEANS.

Everything in the bean list has advanced during the past week and still further advances are to be expected. The East has been the heaviest buyer here although a good export business is reported. A few Lady Washingtons were sent in this week by Modesto growers and the holders realized more than \$1000 for a hundred-sack lot. Interior reports indicate that very heavy planting will be the order this year. Monterey county alone reports 16,000 acres to be planted to beans this year. Local dealers all agree that the maintenance of the present demand will mean further sharp gains, especially on Lady Washingtons, Limas, large whites and horse beans. Blackeyes, about the last variety to join the upward movement, have advanced twice this week.

[Recleaned, f. o. b. San Francisco.]		
Bayos, per ctl.	\$ 8.90@8.25
Blackeyes	6.50@6.85
Cranberry beans	9.00@9.25
Horse beans	5.00@6.00
Small Whites (south)	11.75@12.00
Large Whites	11.50@11.75
Pinks	8.25@8.35
Limas (south, recleaned)	11.75@12.00
Red Kidney	11.75@12.00
Mexican Reds	8.90
Tepary beans	8.50@8.75
Garbanzas	4.25@4.50

HAY.

Receipts of hay for the past week represented all grades of hay and were about 300 tons short of the previous week's total. However, the rains throughout the Northern part of the State have given a much easier tone to the market and prices were without change. Stock hay is scarcer here than is fancy wheat hay, but this is nullified by the drop in the demand for the former, as a result of the showers. It is probable that the rains will result in the placing on the market of the hay which has been held for insurance against a dry year, and just how big a drop in prices may be expected will be determined by the amounts held back. The export trade continues fairly good. Straw is scarce and may advance. Some rice straw of good quality was received this last week.

[Price per ton, carlots, San Francisco.]		
Wheat, No. 1	\$20.00@21.50
No. 2	18.00@20.00
Tame oats	18.00@22.00
Wild oats	17.00@22.00
Barley	17.00@20.00
Alfalfa	16.00@20.00
Stock hay	16.00@17.00
Straw, per bale90@1.10

FEEDSTUFFS.

More feedstuff prices were without change during the past week as trading was very slow. The bulk of the local sales came from out-of-State sources and business of this type was responsible for small advances on cracked corn, middlings and rolled barley.

[Per ton, San Francisco.]		
Best Pulp, per ton	\$20.00@21.00
Alfalfa meal, per ton	23.00@24.00
Brn per ton	20.00@21.00
Oil Cake	42.50@45.00
Cocunut cake or meal	31.00@32.00
Cracked corn	48.50@49.50
Middlings	39.50@46.00
Rolls Barley	45.00@47.00
Tankage	47.00@48.00
Rolls oats	44.00@45.00
Rice middlings	31.00@33.00

POTATOES, ONIONS, ETC.

Potatoes continue to hold the center of market interest, the heavy buying of Eastern parties in this market being responsible for considerable activity. Delta stock is bringing as high as \$4.25 here while some special brands are being held at \$4.50. The further offerings of Japanese onions here, and

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

a let-up in the Eastern demand, has brought a drop to \$9.50@10.00 per cental on yellows, although it is hardly expected that this low level will be maintained.

Peas, per lb.	6 @10 c
Hubbard squash, per lb.	2 1/2 @ 3 1/2 c
Lettuce, crate	\$1.25@1.75
Celery, Delta, crate	2.50@4.50

Sweets, per lb.	5c
Onions	9.50@10.00
Garlic, lb.	3@5c

POULTRY.

With Eastern markets still so high that the Middle-Western producer refuses to ship to this market, prices on California fowl have naturally been

very firm. Some advances have occurred, although geese and ducks were lower. Not enough dressed turkeys are coming to hand to warrant quoting. Fryers were the scarcest article on the list and registered a very sharp advance. Squabs held unchanged. Hens of average weight were easily disposed of. Belgian hares sold well. Turkeys, live, lb.

do, dressed, large, lb.	22@25c

Special Livestock Market Report.

San Francisco, Feb. 28.

CATTLE are still in heavy demand although buyers are only purchasing on a hand to mouth basis in hope that some relief from the high prices may materialize. Prices being paid in the country are not warranted by the wholesale price of beef, but holders are taking advantage of the light supply to demand whatever they feel like. Because of the generous rains of the past week, it is thought that the "grasser" supply will not be more than two weeks later than usual.

Steers, No. 1	9 1/2 @10 c
No. 2	9 @ 9 1/2 c
Cows and Heifers	7 1/2 @ 8 c
No. 2	7 @ 7 1/2 c
Bulls and Stags	6 @ 7 c
Calves, light	9 @ 9 1/2 c
Medium	8 1/2 @ 9 c
Heavy	7 @ 8 c

HOGS are in big demand at this market, but with the extremely high price quoted supplies are short. With a \$13.60 top at Chicago today, local packers cannot touch Idaho or Utah supplies and are having to rely solely on California offerings. There is a falling off in the percentage of good grain fed hogs arriving and buyers are having to take some soft hogs to supply the fresh meat demand.

[Rough docked 20 pounds, piggy		
sows, 40 pounds, stags 80 pounds.]		
100 to 150 lbs.	11 c
150 to 300 lbs.	12 @ 12 1/2 c
300 to 375 lbs.	11 1/2 @ 11 3/4 c

SHEEP and LAMBS are little changed from a week ago. The last shipment of Idaho lambs is now in transit and buyers profess an ignorance of any further supplies in California. Utah or Idaho. No improvement is looked for till the spring run of lambs starts.

WOOL is strong, particularly pulled wools. Country buyers report Bakersfield clip about all bought up and very little movement at Red Bluff although sales of Sacramento Valley wool are reported at 40c. There is no activity as yet reported in Mendocino county, but prediction is made that the 40-cent mark will be reached there also.

Sacramento Valley, spring clip.	39@40c
Mendocino, year's	32@33c
Southern, spring clip	28@30c
Southern, 7 months	15@18c
Imperial Valley, 7 mos.	14@15c
Nevada, year's	31@32c

HIDES are in better demand, especially for country hides, but slight activity in packer hides. Tanners seem decided to fill their present requirements in the country in the hope of breaking down packers' prices.

Steers	23 @ 25 c
Cows	23 @ 25 c
Light hides, 25 to 48 lbs.	25 @ 26 c
Kip	20 @ 22 c
Calf and veal	29 @ 30 c
Dry Hides	32 1/2 @ 33 1/2 c
Dry Kip	35 @ 36 c
Dry Veal and Calf	38 @ 40 c
Pelts, long wool	\$3.25@3.50
Short wool	1.25@1.50
Horse hides, wet, large, ea.	5.00@5.50
dry, large	3.00@3.50

No. Portland, Ore., Feb. 26, 1917.

CATTLE—All beef stuff met a very good demand today. It was an active market and sellers disposed of all bid-dings early in the day. Prices on most all good steers were 10 to 15 cents higher, while butcher stuff was 25

cents higher. Several loads of prime grain-fed steers brought \$9.75 with another at \$9.60. There was a considerable spread of prime steers that sold from \$9.35 to 9.60. Medium steers were in good supply and sold from \$8.50 to 8.80; bulk of cows were sold at 25 cents higher basis, good ones sold from \$7.25 to 7.50, while fair and medium killing cows brought \$6.75 to 7.00. A few prime heifers brought \$8.50; the unchecked demand and advancing prices seem to have no end in the bull division. Light bulls brought \$7.50 with the bulk of the good fat bolognas going from \$6.50 to 7.00; medium kind brought \$6.00 to 6.25. A few prime light calves brought \$10.00.

HOGS: There was an even advance of 25 to 35 cents in hog values today, and 50 cents in the bulk of sales compared with a week ago. Demand was very good both from local packers and butchers as well as outside buyers. Several of the prime heavy hogs brought \$12.85 while the bulk of sales were made at \$12.75 to 12.85. Pigs advanced sharply with but a moderate supply, the bulk of sales were made at \$11.50 compared with \$11.00 last week.

SHEEP: The firm tone in the sheep trade continues, prices are advancing almost every time offerings are received on the market. There were but a few loads of sheep on the market today, one car of shorn wethers and one mixed load of ewes and bucks, the shorn wethers were taken at \$10.90, the highest price ever paid here. The mixed load of ewes and bucks, weight straight at \$9.50. There were no lambs available although prices were quoted at \$12.75 to \$13.00.

Los Angeles, Feb. 27.

CATTLE: The market situation remains much the same as a week ago. Very good offerings were had the past week both from California and Arizona and of very good cattle. But with killers all in the market and wanting supplies and the beef market holding up very well, old prices were fully sustained and the offerings were disposed of without much trouble.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$9.00@9.50
Prime cows and heifers 7.50@8.00
Good cows and heifers 7.00@7.50

HOGS: Receipts the past week were not heavy and the demand was very good. California and Arizona furnished a very good number of very good hogs, though the supply was all wanted; killers bid up full last week's prices for all offerings. But few Idaho hogs in, most of them still being drawn East by the high prices there.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. \$9.75@10.25
Mixed, 200@250 lbs. 10.25@11.25
Light, 175@200 lbs. 10.25@11.25
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: With but few coming in a firm market was had the past week. With a good demand for mutton and lamb buyers took all they could get even at present high prices. As of late, what arrived were mainly from Idaho and Utah, but few being had from nearby sections.

Per cwt. f. o. b. Los Angeles:
Prime wethers \$9.00@10.00
Prime ewes 9.50@10.00
Yearlings 9.50@10.00
Lambs 13.00@14.00

CALVES: Arrivals continue good and a slow, weak market was had the past week. Selling at \$8.50 to \$9.50 per cwt.

HIGH POULTRY PRICES STAGNATE BUSINESS

Poultry prices seem to have reached the limit. People are buying substitutes. San Francisco would normally use five cars live poultry per week at this season, but none was received last week and the stocks of frozen poultry are getting light. California normally draws three-fourths of her table poultry from the Middle West; but this supply has recently gone East. This week one company quotes 32 to 35 cents per pound for broilers here; young roasters over 2 1/2 pounds, 25 cents; Belgian hares 12 to 13, young ducks 18 to 20.

Belgian Hares (live)	21@22c
	13@15c

BUTTER.

Butter prices closed at exactly the same level as was in effect on the opening day of the week, with buying for outside shipment responsible for an advance last Saturday. Receipts have been very much larger but the Alaska trade has developed early this season and Seattle is already buying here for northern shipping. The rains promise grass butter very shortly and only abnormal conditions in the East can support this market. The average price on the extra grade for the week just closed was 37.00 cents, as compared with a 36.9 cents average for the corresponding period last year.

Thurs. Fri. Sat. Mon. Tu. Wed.		
Extra	36 1/2 36 1/2 38 1/2 37 1/2 36 1/2 36 1/2

EGGS.

The rush of spring receipts and slumping prices in the East have combined to send egg quotations crashing in the local market. During the week just closed eggs have lost 7 1/2 cents in San Francisco; 10 cents in New York, 12 1/2 cents in Chicago and 7 1/2 cents in Los Angeles. Receipts have increased very heavily. Some light shipping is reported. The extras grade brought an average price of 29.4 cents as compared with a 20.3 cents average for the same week in 1916.

Thurs. Fri. Sat. Mon. Tu. Wed.		
Extras	31 1/2 31 30 27 1/2 28 1/2 24
First	30 1/2 30 1/2 28 26 26 24
Ex. Pullets	30 29 27 26 24 21 1/2

CHEESE.

Heavy trading in cheese marked the past week, a good increase in receipts being generally absorbed by buying for Eastern shipments. A sudden flurry sent old style fancy Flats off to 19 1/2 cents on the closing day of the week, but this is not expected to hold. Young America advanced, while Jack cheese was firm at quotations.

Y. A.'s	19 1/2 c
Fancy Calif. Flats, per lb.	22 1/2 c
Monterey Cheese	16@20c

Apples: The receipt of a small export order and the low figure of local holding caused a small advance on Newtown Pippin apples this week. Bellflowers were unchanged.

Bellflower, box	\$.60 @ .75
Newtown	1.10@1.25

CITRUS FRUITS.

After refusing for nearly a week to name f. o. b. prices, the California Fruit Growers' Exchange has announced prices on oranges that are 40 cents above the eight year average. The new figures mark an advance of 25 cents per box over the last named figure. Fancy navel are held at \$2.25 @2.40 per box, f. o. b. shipping point, and choice at \$2.00@2.15. New prices on lemons, that are expected to be as startling, will be named shortly.

Oranges:		
Navels, fancy, per box	\$2.40@2.75
do, choice	1.85@2.25
Lemons:		
Fancy, per box	3.25@3.50
choice	2.50@2.75
Lemonettes	1.50@2.00
Grapefruit, fancy	2.25@2.50

DRIED FRUITS.

A few deals in futures, made between the packers and the more speculative of the growers, were reported this week, but developments have been principally confined to dickering with nothing closed. Some business in future prunes at 4 1/2 @4 3/4 c per lb. were reported, but the bulk of the growers are holding for 5 1/2 cents. International developments were not favorable for the dried fruit industry.

[Net to growers, bulk basis, f. o. b. shipping point.]

BUTTER.

Receipts of week ending Feb. 27, 1917—311,346.
Receipts of week ending Feb. 27, 1916—284,340.

More rain, warmer weather and promise of better pastures and increased milk production caused a decidedly weaker tone to the market the past week. The general feeling was that the time of year is at hand for lower prices, and that values were being held up by the want of cold storage stocks and a continued good consumptive demand. The holdings in cold storage throughout the country, February 1, being 1,157,084 pounds lighter than the same date last year. The result was a break of 2 cents on change up to Monday, Chicago 10 lower and New York 2c off.

EGGS.

Receipts (railroads) for week ending Feb. 27, 1917—3499 cases.

CANNING PEACHES HIGH PRICED

Forty dollars per ton for Tuscans and Phillips is the contract of a canning company to growers in Sutter county in consideration of contracts for the succeeding nine years at a lower price. For any canner to contract 10 years ahead as has been done in Placer county for at least 2200 tons, seems reckless in view of the greatly increased acreage to come into bearing. The venture is based to some extent on the tomato famine. Tuscans and Phillips are generally being contracted at \$30 to \$35, though San Joaquin Valley clings are held tight.

Receipts (railroads) for week ending Feb. 27, 1916—3014 cases.

More receipts in the past week and markets East working lower, caused prices to break sharply. The consumptive demand held up very well, encouraged by the lower prices. Shippers, however, were inclined to go slow, the Eastern markets slumping causing them to hold back. While extras went off 2½¢ up to Monday, case count 3¢ and pullets 3¢, still the market is 5¢ higher than this time last year. Tuesday, with all other markets off again and receipts liberal, there was a further break on call of 1½¢ and trading light. Extras went to 23½¢ case count, finished at 21¢ and pullets at 21½¢.

1917	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Extra	29½	29½	29½	28	26	23½
Case Ct.	27	27	26½	26	24	21
Pullets	26	26	25	24½	23	21½
1916						
Case Ct.	19	19	19	19½	18½	18½

POULTRY.

A fairly active and higher market was had the past week for all young stuff. No Eastern poultry in and the local receipts only fair, caused dealers to bid up higher for broilers, fryers, heavy hens and roasters. Turkeys, ducks, and geese met with good demand at full prices. The consumptive demand holds up well, even at present high prices.

We quote from growers:

Broilers, 1½ to 3 lbs.	29@30c
Fryers, 2½ to 3 lbs.	26@27c
Hens over 4 lbs.	21@22c
Hens, under 4 lbs.	19@20c
Ducks	22@23c
Geese	18@19c
Roosters, 3 lbs. up (soft bones)	24c
Turkeys, heavy, 12 lbs. and up.	29@30c
Turkeys, light	24@25c
Squabs, live, per doz.	\$1.50@3.00
Dressed	3.75@4.85

CABBAGE AND CAULIFLOWER.

There was a further firming up of the market the past week for both cauliflower and cabbage. The arrivals were light and a good shipping demand was had. The quality of the offerings not so good as the past few weeks and unless better stock is brought in it is thought buyers will hold back and insist on lower prices. Shippers only want fancy stock and for such will pay good prices. Cabbages sold the past week at \$4.00@4.75 per cwt. and cauliflower at \$1.40@1.50 per standard crate.

BEANS.

The market took another upward jump the past week. Limas, whites and blackeyes all higher, while limas made a sensational advance. There being a scarcity of seed and a very good general demand caused buyers to bid unheard of prices heretofore. Pinks firm in sympathy with other varieties.

We quote from growers:

Limas	\$12.50@13.00
Large white	12.00@12.50
Small white	12.00@12.50
Pinks	7.50@8.00
Blackeyes	6.00@6.50
Tepary	5.75@6.25

HAY.

There was very little interest in this market the past week. Not much coming in and not much wanted. The rainy weather interfered very much with the shipping demand while the local trade only took such lots as it had to have. Prices, however, unchanged. Receipts, 169 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$18.00@20.00
Oat hay, ton	19.00@21.00
Alfalfa, northern, ton	17.00@18.00
Alfalfa, local, ton	19.00@21.00
Straw, ton	9.00@10.00

Citrus Report.

Los Angeles, Feb. 27, 1917.

Shipments of citrus fruits from Southern California from November 1 to February 25: Oranges 8236 cars and lemons 1831 cars. Same time last year: Oranges 7323 cars and lemons 1832 cars.

Shipments from Central California from November 1 to February 23: Oranges 4029 cars and lemons 154 cars. Same time last year: Oranges 4179 cars and lemons 135 cars.

There was more life and a stronger tone to the Eastern markets the past week. With clearing weather, general picking and shipping was resumed the past week and more and better oranges went forward. This with milder weather enabled the display of oranges on stands in Eastern cities, helped the demand and encouraged better buying and stronger prices. The Florida crop, too, is pretty much out of the way. Locally the situation is little changed from a week ago. There were not so many culls in and there was a better movement in oranges than for some time. Prices however, show no change from a week

Publisher's Department.

One hundred and eighty-two new paid subscribers were added to our list during the past week. The heavy rains kept some of our men indoors part of the time, but the crop prospects are so much better that the slump of one week will be quickly overcome.

John G. Mee of St. Helena writes: "I shall always bear in mind the good results secured through advertising in your paper."

In remitting \$5 for five years' advance subscription to the Rural Press, S. F. Leib of San Jose writes: "I value highly everything Professor Wickson writes. I think he is one of the best, all-around posted men in California."

"I consider a dollar invested in the Rural Press brings me bigger returns than any other one dollar I can invest." —Luther C. Martin, Selma.

"Feeding of Farm Animals" by W. H. Jordan, Director of the N. Y. Agricultural Experiment Station, Geneva, is a new book just published by the Macmillan Company, 66 Fifth Ave., New York, price \$1.75. The book is divided into two parts covering the principles of feeding and practice of feeding. Gives many valuable tables, is well illustrated and contains nearly 300 pages. It should be in every stockman's library.

CROP CONDITIONS IN CALIFORNIA.

Following is a general summary of crop prospects in this State as reported by a recent observer:

San Joaquin Valley.—In parts of

Tulare county frosts have damaged citrus fruits, especially those delayed in picking; Valencia oranges, not harvested until spring months, have suffered somewhat. Apparently a large acreage of barley and wheat is going in. The alfalfa crop has been pretty well sold and good prices are being obtained by those who held on. Cold weather has delayed the growth of new feed which is working hard-ship on feeders.

Sacramento Valley.—In Sutter county all available land will be used this year. Barley acreage this year is about normal; sugar beets 50 per cent increase; beans 10 per cent increase; raisin grapes 10 per cent increase. Reclamation work is progressing and will give more land for crops.

Contra Costa County.—The usual acreage of crops has been seeded and now are enjoying the warm rains. Prices of hay continue high (\$25) and these prices are likely to continue until new grass.

LABEL DEPARTMENT

SCHMIDT LITHOGRAPH CO.

SAN FRANCISCO

This proves, more powerful than words, the great pulling power of the Chalmers. A short time ago a big steam hammer arrived at the Chalmers works. It weighed in excess of 30,000 pounds. After it was unloaded from a freight car it had to be moved to a building a quarter of a mile away. A Chalmers chassis, just finished, was taken from the factory and a towing rope attached. Several times the rope broke and the steel rollers placed under the hammer were crushed like eggshells. The Chalmers, however, hauled the load with ease, and the hammer was in place in an hour.

Specifications

Engine—6 cylinders, bore 3¼ ins., stroke 4½ ins., piston displacement 224 cu. ins. Power—45 h.p. (on the brake test.) Starter—Westinghouse 2 unit. Carburetor—Stromberg, horizontal, hot air heated. Clutch—Dry disc, asbestos on steel. Fuel feed—Stewart-Warner vacuum system. Ignition—Remy distributor, Willard 80 ampere hour battery. Tires—32 x 4, chain tread on rear.

How Mitchells Differ Because of What John W. Bate Has Done

Hundreds of Extras

Factory efficiency has been made a fine art in this plant. John W. Bate, our efficiency engineer, has spent millions to attain it.

This entire plant, covering 45 acres, was built and equipped to secure it. Now our new body plant completes it. We urge you to learn where these tremendous savings show in extra value.

For a Lifetime Car

Part of this saving pays for 100 per cent over-strength. Our margin of safety used to be 50 per cent. It has now been doubled.

Steering parts, gears, axles, etc., are made oversize. Our rear springs are built so that, in two years, not a single spring has broken.

Over 440 parts are built of toughened steel. Parts which get a major strain are built of Chrome-Vanadium. The steel in Mitchells costs us up to 15 cents per pound. And we do not skimp on weight.

The result is safety, freedom from repairs and troubles. And a car which probably will serve men for a lifetime. Time will prove, we believe, that this double strength is worth half the price of the car.

\$4,000,000 in Extras

There are 31 extra features in Mitchells, most of them exclusive. On this year's output these extras cost us about \$4,000,000.

They are things like a power tire pump, an easy control, a ball-bearing steering gear, engine primer on the dashboard, a light in the tonneau, a locked compartment, etc.

Every one is a wanted feature. Yet they are impossible, at a modest price, without Mitchell factory efficiency.

Extras in Luxury

The Mitchell has long been considered by experts one of the handsomest cars on the street. The output is largely sold in metropolitan centers.

Yet this year we have added 24 per cent to the cost of finish, upholstery and trimming. We are giving you heat-fixed finish, extra-grade leather, and scores of new dainty touches.

All this results from another economy. We now occupy our new body plant. All Mitchell bodies, open and closed, are built here now, under Bate efficiency methods. And this added luxury clearly shows the result.

What So Important?

What else is so important?

Extra values like these, without extra price, come only through efficiency. Under other methods, all these values are wasted in the shop.

Mitchell stands unique among fine cars in respect to efficiency. For a dozen years John W. Bate has worked here to attain it. Go to your Mitchell dealer and see the results. Compare it with cars built otherwise. If you can, take an engineer with you, and we will abide by his verdict.

TWO SIZES

Mitchell — a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price \$1460, f. o. b. Racine

Mitchell Junior — a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor— $\frac{1}{4}$ -inch smaller bore than larger Mitchell.

Price \$1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

\$1150 Mitchell Junior

Note that this year's line includes two sizes—the Mitchell and the Mitchell Junior. But the Mitchell Junior—for five passengers—is still powerful and roomy.

This is also for efficiency. So the man who wants a 5-passenger car need not pay for more power or more room than he needs.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

MARCH 10, 1917.

LOS ANGELES

Senator Sorghum, a California Pioneer.

[Written for Pacific Rural Press.]

THE Sorghum family got in wrong with the people of the United States. It was, perhaps, inevitable that such extreme aristocrats should not strike it quite right in a new world. The Sorghums went out with Adam from gardening to field work. They helped his eldest son to make up that batch of hot cakes—an unacceptable burnt offering, from which they gained their family crest, the mark of cane, which they carry to the present day. They were with Joseph when he reigned as the world's first "food dictator" in the court of Pharaoh. Their blood literally flowed in the veins of Confucius and Buddha. They nourished Nebuchadnezzar when the grass failed upon the dry plains of Babylon, and for millenniums they were strictly in it with all races of men in Asia and Africa—maintaining the Sorghum nobility from prehistoric tombs through scores of ancient dynasties of mummy cases to the modern warehouses and flat-boats of the Nile Valley. As, however, often happens with proud ruling clans, the Sorghum family had one branch which trailed its plumes upon the common floor of humanity, groveled around the north Mediterranean countries, and finally reached exaltation in this country at the beginning of the last century, and soon emblazoned a crest of its own upon American heraldry—a broom rampant above a milk-white arm: token of cleanliness, thrift, and the independence of woman, signs in which the new world conquers.

Broom Corn.—In marked contrast with this great achievement by their poor relation, has been the ill-luck, buffeting and deferred appreciation which the titled nobility of the Sorghum family has encountered on this side of the world since their application for naturalization papers in this country about sixty years ago. These decades of misunderstanding and many dishonors have been possibly more the fault of welcoming Americans than their own. The Sorghums were expected to do things here which they have never done elsewhere in the world, viz., to displace tropical sugar—to do this everywhere in this country and to disprove the European demonstration that the beet alone can displace the tropical cane. During more than a quarter of a century, national and state governments, corporations and individuals, expended millions of dollars in vain efforts to install the Sorghum family as northern sugar magnates, until the very name became a by-word and a synonym for all that was fatuous and fallacious in public and private policy and endeavor. Then it was that the region between the Mississippi and the Rockies got

Nineteenth of a series of sketches in which the Editor presents suggestions, drawn from long experience, of what Californians have done and may do for the Advancement of California Agriculture.

around between a battered straw hat and broom-like whiskers. It was also the nickname for any embodiment of wild ideas, wrong reasoning, inaccuracy and prejudice. It was the description of the attitude of the man who first said: "I hain't no use for enny kind o' corn which hez seed whar the tossel oughter be"—an attitude of ignorance of false reasoning and of conceit!

its science of economics and its politics hopelessly confused, and the caricaturist created the sobriquet, "Senator Sorghum," for application to anybody who came out of the West with a brain-storm whizzing

California Confuses Sorghum and Sugar Cane.—Although the early Californians had knocked about too much in the world to furnish many exemplars of Senator Sorghum's traits of mind and body, they did go through nearly all the phases of the sorghum-sugar delusion—excepting the investment of much money in it, and they were spared that because the sugar beet interest arose in time to get the money and apply it to the foundation of a great industry instead of wasting it on sorghum and corn-stalk sugar, as was done in the eastern half of the country. The rise, development and decline of the saccharine-sorghum interest in this State include many interesting details, with which we would like to regale our readers, but we must restrain our predilection to do so at this time and push forward with the main narrative.

In the first place, California welcomed sorghum under wider misapprehension, perhaps, than existed in Eastern States, away from the gulf, because the early Californians had reason to believe that this State could produce true cane sugar while farmers in Eastern States knew that they could not. When the Americans came there was true "tropical cane" growing in Los Angeles, as there has been ever since and for the same uses. It probably came from tropical parts of Mexico or Central America, whence many plants were brought in early days. The demand for sweet cane for dentiflingual extraction of the juice was keen and large among the argonauts. In 1855 Antonio Salazar of Los Angeles sold his crop from five acres for \$1000. He said: "He had formerly sold it for 12½¢ per cane and latterly at 1¢. It was all sold for chewing. It is replanted once in six years"—showing that it was not a sorghum. He said,

however, that "It makes good molasses, but does not granulate readily." At F. P. F. Temple's, at El Monte, there was in 1856 "an acre of cane

(Continued on page 300.)

SET UP THE FRUIT INDUSTRY.

THE Legislature now in session is having many gleaming visions spread before its wondering eyes this winter. Unless it shades its sight resolutely against the flashes of sheet lightning from many of the flossy fallacies which are being uplifted it will be blinded so that it cannot discern the real features of the industrial landscape. It may forget that the fundamental condition of prosperity is not a war to force selling cheaply, but to have something to sell. All the fancy phases of distribution of prosperity which are now claiming so much attention seem to be proceeding upon the assumption that ample and increasing production is assured by the nature of things, and all that California people have to do is to cut the melon which is growing itself. Of course, we are not objecting to serious consideration of all the important questions which are arising in our progressive industry and in the interest of our citizenship, because such consideration will make us wiser and fairer in all our dealings with each other and the world, but it should not be forgotten that the fundamental thing to do is to make production prosperous and perpetual.

In writing these platitudes we are thinking of the needs of our fruit industries, which should be adequately met by the Legislature now in session. Let it not be forgotten that the fruit industries are the only one of our producing groups which has done all these things during the last half-century, viz.: (a) going forward without serious depression; (b) practically excluding from our markets all products of its own kind; (c) selling beyond State lines products worth, say, a hundred millions of dollars a year; (d) developing capital, locally and from investments drawn from abroad to serve such production, directly and indirectly, to an aggregate of, say, a billion dollars. This is California's greatest industry; it makes California greatest in its line in the United States, and, as things now are, greatest in its line in the world—for our only rival, France, now outraged and devastated, has her old greatness to regain.

IS OUR FRUIT INDUSTRY DEPENDABLE?

THE first thing the Legislature should do is to resolutely set its face against distraction which might cause the fruit industry to be neglected or inadequately provided for, in the push of other matters which are clamoring for public mind and money. Is the industry dependable? It has shown that it is. The shock of war, which made all our dealers croak and producers shiver, really caused the industry such a little tremor that it almost passed in a night. Though the European demand was instantly fractioned, prices constantly advanced; the industry demonstrated American independence. The whole country recognized its stability and its unclouded outlook. Not only have fruit plantings this year emptied our nurseries of planting stock, but even before this courage came to growers there was the greatest association of men and money in a preserving corporation that the State has ever had

in all its buoyant history. Even while growers were organizing capable control organizations, capitalists on the manufacturing side were confidently extending their own operations and capital-gathering. Even while we are writing, contracts for canning fruits are being made in various parts of the State at very profitable prices for the product of trees hardly yet breaking bloom. Even while events threatening all kinds of industrial disturbance and arousing the most disgraceful political passions, are transpiring, we are planting fruits in California with redoubled energy, our railways are contracting for immense new equipment, our shipyards on San Francisco bay have developed a ship-building capacity greater than any other ship-factories in the country, and promise to be in the foundation of an American marine in the immediate future. All these things are, of course, securely in the safe basis for our future fruit production. There never was a time when its outlook was so fully assured. Producers have reached the earlier achievements of self-consciousness and co-operative action; manufacturers of fruit products never had such courage and capacity; the ways to the world were never so wide open. Our fruit industries were never so dependable as they now are!

HOW THE STATE CAME TO KNOW ITS NEED.

IN A general way it may be said that the fruit industry needs more distinctive and efficient State service and more of it. Executive work in promotion and protection of tree fruit growing was begun about 1800, and vine-work was begun before that. It was undertaken by the Legislature through the conviction that California had a prospect of something great in fruit, and planters ought to be helped by the State. Naturally just what to do was not very clear at that date. We remember an early secretary of the Board of Horticultural Commissioners who considered it his duty to put his feet on his desk and read the daily papers all the morning so that he "would not overlook what needed to be done." After lunch he did it, whatever it was. Of course, others connected with the board did more, and it was of great value, but the point we are making is, that the part of the officer representing the executive branch of the State government was to keep his office cushion flat and his eye on politics. It was rather a prevalent conception of State executive work in those days. There was an awakening after that, and the succession of decades and State horticultural officers brought other ideas of what the executive function, as related to fruit promotion and protection, really was. These ideas lacked not numbers, but they did lack definiteness of purpose and method. Under laws which these functionaries made for their own authorization, this multiplication of ideas increased, and the real executive function became more obscure. It was, however, an evolutionary process in operation, and it was perhaps unavoidable that it should run out into a lot of appendixes which had to be naturally sloughed off or operated upon. We call this unavoidable because the attitude which the State of California early assumed toward the fruit interests had never been previously assumed by any other State. The purposes were new, the methods untried, and the officers fallible men of purposes usually better than their vision of the relation of things and of ambition not always regulated by a proper conception of expert public service in State executive work. Still, there was force enough to do many good and necessary things, honorable to the doers and helpful to the State. More recently

there has arisen a better idea of what State executive work for the fruit industry and the evolutionary method has brought us, now the service of a State Horticultural Commissioner who has a better, clearer, and truer idea than all his predecessors had, of what the State should do in the revision of its horticultural laws and the faithful execution of them for the advancement of the industry they are designed to advance and to protect.

WHAT DOES THE STATE NEED?

THAT is the question which it is now up to the Legislature to judge and to enact, and it is that which we trust they will not allow to be obscured by other claims upon their attention. Our conviction is that the several bills which have been introduced embody the ripest judgment of those who have had most experience in developing and protecting the fruit industry for many years. The bills to which we refer were prepared by a large committee the creation of which was provided for by the Visalia Fruit Growers' Convention of 1915. This committee steamed safely through the submarine zone proclaimed by the San Bernardino convention of February, 1916, began its work under the acting-commissionership of Mr. Weldon, and has been very active ever since Mr. Hecke became State Horticultural Commissioner in October last. Its membership is widely representative of fruit-growers' organizations in different parts of the State, and it has been under the leadership of Frank B. McKeivitt, whose practical achievements in fruit lines have given him much wisdom and influence. The proposed laws are certainly well born and trained, and therefore are entitled to demand much confidence from the law makers.

In the nature of things, we cannot present the details of the revised horticultural laws whose enactment is asked. The text of them would probably fill an issue of this journal. They can be found on file in all public libraries throughout the State, and probably copies can be secured through the office of the State Horticultural Commissioner at Sacramento. They should be carefully studied by all in the public interest and from the point of private growers. They include revision of the laws defining the equipment and duties of the State Commissioner and his staff and the law concerning the appointment duties and powers of the county horticultural officers, and there are other special enactments proposed by others than the committee named above, which should receive careful attention. It will be a misfortune to the fruit industries if the State laws for their advancement and protection do not come upon a basis of greater harmonious, uniform and rational action by the enactment of the present Legislature.

BETTER EXECUTIVE WORK PROVIDED FOR.

IT HAS long been seen that State executive work for fruit growing should be broadly and evenly distributed over the State, and that uniform efficiency should be insured by direct connection with the State capital, and many years ago the State Commissioner was made, ex-officio, member of all county boards. But, though this provision enabled previous State commissioners to do many and important things in co-operation with local authorities, it was physically impossible to fully attain the ends of this reasonable and beneficial unification of State work. No one man can act personally through about a thousand miles of distance when the important things to be done will not arise at stated points in the calendar but have a way of arising as emergencies which determine their importance usually. It is therefore proposed now that this immediate participation by the State office shall be provided by two deputies, one in the north and the other in the south, whose chief duties shall be to co-operate with the counties in each of their districts, and thus represent the State in county action, as was originally intended. This has, of course, a twofold purpose—to assist the counties with their local problems, and to advantage the State also by participation in counsel and action which are seldom strictly local, but nearly always have broader reasons and

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., March 6, 1917:

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka60	22.03	33.04	56	30
Red Bluff21	14.89	18.37	60	36
Sacramento	00	11.48	14.54	60	36
San Francisco	00	13.97	17.13	64	42
San Jose	00	11.34	12.38	64	30
Fresno	00	6.80	6.80	64	36
Independence	00
San Luis Obispo	00	21.99	14.84	70	36
Los Angeles	00	14.84	11.63	76	44
San Diego	00	8.50	7.53	70	42

requirements of action. This participation by the State will not only promote wider uniformity and reason in such action, but it will give local officers greater confidence, and win for them wider local support, without which they must always largely depend for success. It will also incidentally spur them to greater watchfulness and wider understanding of what they see, and the hope or the menace in it, as the case may be.

But it is not alone in protective work that the State Commissioner needs district deputies. He needs them to keep the standardization work, which the law places upon him, true to the right standards. It is rational and right that standardization of products should rest with the horticultural officers as the law provides. It is theirs to have the growers' points of view and requirements. If they are expert and conscientious, as they surely should be, they will have the growers' good will and confidence in motives, without which standardization is hard to achieve. Personal participation in this work the State Commissioner should have, and in Mr. Hecke's case is qualified to have, but it seems rational that the only way he can fully cover it is by such qualified deputies as he should be empowered to select to co-operate with the county officers.

UNIFORMITY AND EFFICIENCY IN QUARANTINE.

CALIFORNIA has probably the best and most capable quarantine against introduction of pests from beyond the State that ever existed in this country, and it is conducted most efficiently by Mr. Maskew, but there are two things decidedly the matter with Mr. Maskew. First, he is too ill paid. He should have money enough to smother a beefsteak in onions at least once a week, and there may be others of the Commissioner's staff who should also be better paid. But there is another thing which Mr. Maskew cares more about, and that is some way by which he can do as well on our east front as he has been long doing on the west. By this we mean that all our quarantine laws should be harmonized and unified, as the committee has agreed in the bills now before the Legislature. So far everyone with honest intent desires regulation to provide real protection for the great fruit-growing interest, but every such one, so far as we know, also desires uniform laws, which can be understood and obeyed, and not irrational and conflicting ordinances which tempt every one to escape if he can and take the risk of such induced transgression.

So far as we can see, this can only be done by displacing scattering and conflicting ordinances with a carefully drawn and guarded law regulating the geographical movement of plants under the horticultural executive of the State and in offering such an enactment to the present Legislature the committee has presented the product of harder work than it has done on any other single subject which claimed its attention.

WE HAVE A MAN TO DO SUCH THINGS.

WE HAVE only mentioned a few of the things which the revision of our horticultural laws now pending at Sacramento proposes to do. There are others hardly less important which a careful student of the bills will discover for himself. Our greatest satisfaction at the moment rests in the conviction that whatever the Legislature wisely directs to be done, Mr. Hecke can do. He believes the State should do it; he will pursue proper executive work and make the State greater and the fruit growers more prosperous by doing it and by leaving other tasks to other people, as the laws provide. He has been from his youth up in California that kind of a man, and he was trained right for it. In June, 1913, we strolled one afternoon from the Rhine-landing at Geisenheim to the practical horticultural school, which is on higher ground, a little above the beautiful river before it reaches "fair Bingen on the Rhine," which the poet has immortalized in English verse as a tribute to home love in a distant land. We were kindly received by the instructors at Geisenheim, shown their work and instructional outfit, and were welcomed by their students, one of whom we unexpectedly found was from California. As we saw the arrangements for student's work, the thrifty trees they were training in various ways, their energy and eagerness in their work, we had the pleasure of telling them what one of the students at Geisenheim a quarter of a century before was now doing in California—for we remembered that it was at Geisenheim that Mr. Hecke laid the foundation for the understanding of horticulture which he has so fully developed in this State. And this is the man who now leads the executive work of California for the realization of ideals of efficiency and directness in work which he learned first, perhaps, at Geisenheim. Would that all the bright young men whom we saw there three years and more ago, following in the footsteps of Hecke, were now following his honorable trail in California!

spread of wings nearly covered with yellow spots of irregular outlines which is very abundant in the gardens, during the heat of the day, in the coast region, hovering over heliotropes and other blooms. We have never seen the larvae on the heliotrope, but they take very freely to the plants you mention, also to various weeds and wild flowers. They go through the winter in active state, massing under a protective web. They have, however, no connection with the web worms which appear on fruit trees after the new leaves appear. The worms also appear in masses or others.

Crane-Fly Larvae Destroying Grain.

To the Editor: Crane fly worms are devouring wheat and barley sown in December and January. The ground is alive with them just under the surface. How long is the life of the worm before developing into a crane fly? Is there any effective remedy for destroying them?—E. T., West Butte.

Crane-fly, or daddy-long-legs, larvae or worms, are tough, grayish, cylindrical, grub-like creatures an inch or more in length and with pointed projections at their rear ends. If you try to crush them their common name of "leather-jackets" becomes reasonable. They feed on the roots of grains, grasses and other plants and when the ground is fairly moist they are scattered through such a depth and live upon outer roots so that their presence may not be noticeable. When the plant and the worms are forced to work near the surface, because the lower earth is full of water, they can kill the plant. This usually occurs in wet places or on upland in a year of heavy and continuous rainfall, and in such a winter complaints of injuries by them usually come. The worm pupates in the spring and are probably now near the end of their active period. There is nothing which can be done to them in a grain crop which would not cost more than the value of the crop. Land can be cleaned of them by dry plowing and harrowing in the summer, which crushes many and dries out colonies as they hatch from the egg-clusters laid by the moth and scatter as they grow. This accounts for the fact that a single stem or plant may seem to be covered with them and others free. If you watch, you can capture and burn a large lot of them by cutting off the stem which has them, or you can reduce them by hand picking. They can be poisoned by spraying with lead arsenate: one tablespoonful to one gallon of water, or by using the arsenate of lead powder described in detail on page 265 of the Pacific Rural Press of March 3 last.

Small Potatoes for Seed.

To the Editor: I have quite a lot of rather small potatoes that I would like to use for seed to raise potatoes for our own use. Some have had worms in them. Would it be safe to plant them?—H. A. D., Oakland.

You surely can. Under good growing conditions and with good soil you will get a good stand and good-sized potatoes, if the small ones are well matured and have ready eyes. Spread them out a few days on the sunny side of a fence or building and start the eyes unless they are already disposed to sprout. Plant them whole. Never mind about the worms. They are probably out of the way now and you will have to protect the new crop by keeping the tubers well covered with earth as they are finishing their growth next summer and then keep them from exposure to the moth when digging by getting them into a dark place as soon as possible. Do not allow them to lie around on the ground nor in sacks in the field without careful covering.

Two Crops of Beans.

To the Editor: What kind of field bean can I grow for profit, and how early should I plant them? Can two crops be grown successfully in one season?—J. F. S., Chino.

Pink and blackeye do best in interior situations. Plant as soon as frost danger is over: that is, when it is safe to plant corn and melons in your place. The second crop will depend upon the moisture you have in the soil in mid-summer and whether fall frosts come late enough to allow the beans to mature.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Dwarf Fruit Trees.

To the Editor: Please advise me what roots to use to dwarf the following trees: Citrus, all kinds; cherries, loquat; persimmon; apricot; fig, and medlar. In view of the fact that so many small ranches in California have a very limited area for a home orchard, I believe that information on growing dwarf trees would be appreciated, also indication of varieties which are superior in quality, also hardiness, irrespectively of whether they were commercially desirable.—A. H. O., Oroville.

Our larger nurseries can supply you some pears on quince and some apples on paradise. This is perhaps as far as California propagation on dwarfing stocks goes. Citrus trees of all kinds are somewhat dwarfed by working on Japanese citrus trifoliata, but there is discussion as to how much. The cherry is usually dwarfed by using the sand cherry (*prunus pumila* Bessy), but probably both the cherry and the apricot can be dwarfed by using seedlings of the Sierra plum (*prunus subcordata*). The loquat is dwarfed on the quince root; the Japanese persimmon on the American persimmon root; the medlar on the white hawthorne root. We know nothing about dwarfing the fig. We do not share your idea of dwarf trees for farmers' small orchards. A dwarf tree is much harder to grow and care for; it requires more complex pruning above ground and below ground it must be kept from striking its own roots and is often advantaged in its dwarf-

behavior by root pruning. Almost any dwarf tree will either die or grow into a standard if left to itself on good soil in California. The best layout for a family orchard on a small farm is a few good standard trees adapted to the local conditions. There is not enough information available to make a prescription of home-use fruits, as distinguished from commercial fruits, to apply to the whole State. Some good in one place would be practically worthless in another. In a district where fruits are grown you can easily get good tips from commercial growers as to which kinds they generally "send to the house," for fortunately California growers do not always feel obliged to "eat what they cannot sell." It is also the duty of the nurseryman to know what is particularly good to eat in his district and such advice is usually good to take.

Black Spiny Caterpillars.

To the Editor: I am sending specimens of black caterpillars which have come in large numbers. They are on daffodils, tulips, carnations, roses, etc.; but are particularly destructive to Kenilworth ivy and penstemon; eating the tender new leaves on new growth of the latter. Is there a spray which will control them?—J. A. C., Ben Lomond.

They are very spiny, black chaps with small orange colored markings—larvae of *Lemonias chalcodon*, a black butterfly with its two-inch

Grape Growing in Imperial Valley.

Grapes on light soils for early shipment are making prosperous growers who have good marketing facilities, do not fight diseases, and have a special Experiment Station to study varieties.

[Written for Pacific Rural Press.]

Grapes are the most widely grown fruits in Imperial Valley, their chief use being for early shipment. There were 1,000 acres of bearing age the past season which produced \$200,000 worth of fruit according to Horticultural Commissioner F. W. Waite. Nearly 200 acres we know are definitely planned to be planted this spring, and there are probably many more. One man has contracted for 200,000 cuttings to plant near Dixie-land. Most of these acreages are small, being scattered in all parts of the Valley, but especially on the soft sandy loams about Brawley.

One big reason for Brawley's leadership is the Government vineyard there, in which 215 varieties have been growing under the management of Francis Heiny to find the ones most adaptable. Much of the soil at this Experiment Station is hard and alkaline. "The softest ground with the least alkali produces the best grapes," says Mr. Heiny. "Most of the dead vines on this place have been weakened by alkali and finished by the hot summer sun." Mr. Heiny, who has been here 12 years, points out that the absolute control of moisture in Imperial Valley permits regulation of maturity of wood at will, and allows the forcing of early grapes. Irrigation from early fall until mid-January, then cultivation to keep the ground fine and warm, are the principal means to get early grapes, irrigation of course being continued throughout the summer at 7 to 10 day intervals.

E. H. Erickson, who made better than \$250 per acre average for nine seasons, is planting 35 acres additional this spring, emphasizing the need of sandy soil. He also states with emphasis that the Brawley Fruit Exchange has always shipped through the California Fruit Exchange, and has always received the best net proceeds to the grower, of any shipper in the valley. Mr. Erickson points out that it is hard to get color on the grapes of the Valley.

Supt. W. E. Packard of the University Experiment Station at Meloland, and P. I. Dougherty, County Farm Adviser, point out that the relative failure of the hard lands for fruit is due largely to the fact that they do not take water well, but run together. They often contain an excess of alkali.

For Drying Purposes, we were able to find only a few growers, and they drying on a rather small scale. M. Manoogian of Mesquite Lake is the most extensive raisin drier, using mostly Muscats for the purpose. He dries some every year, but has to be careful or they dry hard. The grapes are left on paper trays in the sun six to eight days and then rolled to finish curing in the shade. They dry moderately well on the vines if left too long, but soon get hard. A. H. Hevener, not far from El Centro, makes a few fine Muscat raisins by drying on tables with mosquito netting to partially shade them. He notes that some days they will cook in the sun.

Varieties.—The Muscat is little grown in the Valley, because it is late in ripening (about July 20 for Mr. Manoogian) and they do not ship as well as several earlier varieties. Two or three strains of Muscats have shown promise as shipping grapes for Mr. Heiny. The Muscat Albardiens is almost as good a shipper as the Maraville de Malaga which is mentioned below. It has large, firm berries, loose clusters, fine flavor and color, bears quite heavily, and must be pruned long.

The Maraville de Malaga has shown great improvement over the common Malaga which is perhaps the most extensively grown variety in the Valley. The Maraville, according to Mr. Heiny, ripens early in July, is tough for shipment, colors bluish red when real ripe better than Tokays color, has large loose clusters which pack well, but the flavor is not superior. Mr. Erickson tells of keeping half a dozen varieties on a shelf in San Diego two weeks. At the end of this time, the Maraville de Malagas were in fine condition with perfect color. He also says they are more alkali-resistant than the common Malaga.

The common (Spanish) Malaga on sandy land, according to Mr. Erickson, ripens as soon as the Thompson seedless; and the berries do not fall off so badly in shipping; but the vine is more sensitive to alkali. Mr. Manoogian says it will stand more alkali than the Muscat, and the berries do not dry so soon on the vines. They ripen for Mr. Hevener July 11 to 15. Mr. Heiny notes that the Malaga makes lots of wood; but the fruit on his places is less sugary, does not color well, includes lots of waterberries, and is in compact bunches hard to pack.

Thompson Seedless seem next in favor perhaps, though there is more interest in some of the Persian varieties. The Thompson grows on a greater variety of soils than the Malaga, according to Mr. Heiny; but he and Mr. Erickson shipped Thompsons and Malagas in the same car that sold at 50 cents to \$1 more per crate for the Malagas than the Thompsons. This was a greater difference than usual of course. The Thompsons are sweeter.

Vahan Azhderian, who is working large vineyards of Thompsons and Malagas at Meloland, finds the Thompsons three weeks earlier than the Malagas, because, as he says, they start earlier and the thin-skinned smaller berries ripen first. Bigger yield and better carrying is credited to Thompsons than Muscats by Mr. Manoogian, though they must be picked at the legal minimum of sugar content or they will shatter off. They are 10 to 15 days earlier, and are better colored than Muscats.

The Earliest Variety planted commercially is the Persian 21, which ripens 10 to 15 days earlier than the Thompson, according to Mr. Azhderian. They look like Thompsons, but are softer, thinner-skinned, more watery, and have seeds. "One can eat more Persians than Thompsons,

Olive Trees

50,000 MISSION and MANZANILLO.
The two best commercial varieties.

Splendid, well-grown stock, perfectly clean of all insect pests, with a splendid fibrous root action, in prime condition to plant.

Olives are one of the coming and most important of all economic fruits grown in California. There is a constantly increasing demand for California Ripe Olives, to say nothing about the value of the crop for the production of oil. They require but little attention, compared to other fruits; they grow with a minimum amount of water. Hilly land, unsuited for ordinary fruiting crops, will suit them perfectly, and can be made not only productive, but highly remunerative.

The stock we offer is A-1 in every respect. If you are in the market for a large or small quantity, you will find the prices more than attractive. If you have some vacant land and are wondering what to plant it with, it will pay you to investigate the prices we can quote you on these trees. Sample trees may be seen at our Sales Department at Ninth and Olive. We can furnish them in the following sizes:

¾ to 1-inch caliper.
1 to 1½-inch caliper.
1½ to 2-inch caliper.
2 to 2½-inch caliper and over.

If not convenient to call, write us or telephone.

however," says he. F. D. Hevener, with ¼ acre of long purple Persians, found that they bore well, on long stems, and were fine eating. Mr. Erickson declares that the Persians do not make enough fruit buds for a good crop, and Mr. Heiny advises pruning long to save all there are. The latter thinks they need a trellis but that a trellis would not pay, though the grapes are of fine flavor.

Sultanas bore a heavy sweet watery crop for Mr. Heiny. Zante currants made heavy growth but too small clusters to pay. Dattier de Beyrouth made fine growth and produced large loose clusters. He graft-

ed a lot of Malagas on his private vineyard to this variety, though it was not doing very well on the Station ground.

Diseases.—Phylloxera is not known, and rigid inspection is intended to keep it out. Mildew does not seem to worry the growers, and they have none of the "mysterious" vine diseases that worry growers in other sections.

The American Vineyard Co. recently purchased 1180 acres near Livingston for raisin grapes, principally Thompsons, and the planting is to be completed by the middle of March.

Planting Walnut Trees.

[Written for Pacific Rural Press.]

A man who has a reputation as a crank about the walnut trees he plants and how he plants them is W. D. McCroskey of Los Angeles county, who has a large acreage of all ages in the Chino district.

Having staked the field and selected and cared for the trees as told in other articles, he digs the holes some weeks ahead of the planting, to air out the soil. On 30 acres of Placentias planted late in the spring of 1915 without loss of a tree, hole digging began in January; and the last of the holes were left open nearly a month before planting. This was in an alfalfa field which was allowed to grow the first year.

A 1x6 about six feet long was notched at the center of one side and at the ends. It was laid north and south with the center notch at the stake. Then two stakes were set in the end notches and the hole dug 30 to 36 inches deep and two feet in diameter. Dirt was piled on the east and west sides for reasons told below, and subsoil separate from top soil. J. F. Donly, who dug the holes, says he averaged about 50 holes per 9 hours. The soil is a dark sandy loam about the same all the way down.

Trees were kept heeled in vertically until planted. Care was insisted on to prevent knocking buds off by rough handling. Trees for half a day's planting were taken from the trenches at once. Their roots were covered with canvas to prevent drying out. Every tree was closely inspected for crown gall, broken buds, blight blisters, or anything else that might nullify the expense of planting and culture. Bruised and broken roots were cut off smooth. The tops, which by contract were not less than 12 feet long, were cut back to not more than four feet tall, so their growth would shade the trunks from sunburn after the first year or two. Spindly trees were cut shorter. The cuts were made two or three inches above a bud so that when birds should perch on the cut end, they would not knock off the young shoot. By the time the

shoot was three inches long, the birds wouldn't hurt it. No top buds died in this orchard.

Setting the Trees.—Two men were needed in setting the trees. One shoveled in dirt enough so the tree would not stand deeper than in the nursery. The other held the tree in place until dirt enough had been placed and tamped around the tap root to hold the tree upright. The roots were then spread out like they were in the nursery and top-dirt packed around them, tramping it as soon as tramping would not skin the roots.

If there was any bow in the tree, its concave side was turned to the southwest against the prevailing wind and the whole tree was leaned toward the southwest to prevent the sun's rays from striking the trunk squarely and sunburning it. Heavy sandstorm winds from the south-east are not considered because they are so infrequent and of short duration. The leaning trees will be vertical in two or three years by force of wind.

Yucca protectors 30 inches high were used, and some of them are still on two years later. Corn was grown in the rows to wrap around the trunks to prevent freezing.

The ground was still moist when the trees were planted, and no water was applied until five or six inches growth had come. If the ground had been dry, he would have watered soon; but carefully, not to soak the ground and drive out all air, for Mr. McCroskey has in previous years lost trees by being "drowned out" at the start.

NEWLY SET WALNUTS.

To the Editor: Franquettes on black walnut roots have just been planted on my black sandy and medium heavy soil. Should they be cut down as low as 16 inches above ground and wax over cut? How should they be pruned when a year old, and when is the proper time to dehorn them? Do they sunburn easily? Is whitewash alone enough protection for them against very hot weather?—E. R. B., Santa Margarita.

Walnut trees are generally cut off at planting, about four feet high. The young trunks must be protected from sunburn; and whitewash is generally considered effective. Prune only to keep the tree clean and balanced. Never "dehorn." Wax the cuts or asphalt them if you have time.

CONTROL OF PEACH SCAB.

Self-boiled lime-sulphur and a solution of finely divided wettable sulphur, which is a mixture of superfine sulphur, glue and water, have been proved by experiments to be the best of known sprays in controlling peach scab, according to Bulletin 395 of the U. S. Dept. of Agr. The applications can be made in commercial orchards at a cost not exceeding five cents a tree and in certain experiments such sprayings have resulted in an increased profit per tree of about \$1.50. The spraying for scab can be combined advantageously with treatment for other diseases such as brown-rot and insects such as the plum curculio.

"Nitragin" tested side by side for years with other seed and soil inoculators has proven itself to be the best legume seed inoculator on the market. Do not sow beans, peas, alfalfa, clover, vetch or any other legume without first inoculating the seed with "Nitragin." ORDER IT OF YOUR SEEDSMAN or direct from us. Ask us for particulars and nearest dealer. The "Nitragin" Company. Waterloo, Iowa

Imperial Valley Date Culture

[Written for Pacific Rural Press by H. J. Bridges.]

About five miles northeast of Imperial, in the Imperial Valley, is a date grove belonging to Geo. E. Howe of Los Angeles and taken care of by C. H. Strowger of Imperial. Some of the trees are ten years old, and were nearly all started from the seed. Between the old trees which are set twenty-five feet apart are a number of younger seedlings which will be taken up and set in orchard form when old enough to tell whether male or female. It is impossible to tell until they bloom, which usually takes four years. The stems of the male trees are short and blossoms are crowded together, while the stems of the female or fruiting trees are long and blossoms are about one-half inch apart.

When the young female is found to bear good fruit, it is set out in orchard form, and in about two years, will throw out "offshoots" near the ground, which can be removed with the aid of a large chisel and sledge-hammer and thence planted in orchard form. A tree will in most cases throw out three of these shoots each year if they are not all taken off at one time. It is advisable to always leave one of the shoots, thus encouraging others to come out.

The fruit of the offshoots will always be the same as that of the mother tree.

Pruning can be done at any time of the year. However Mr. Strowger does most of his pruning between January and March. After pruning, the grove is plowed deep and cultivated thereafter three times during the year. They are irrigated once each week, the water being run down furrows on either side of the trees. According to Mr. Strowger, the date palm cannot get too much water.

Trees five years old will bear some and will continue to increase a little each year up to ten years when they will average two hundred pounds per tree. One tree bore five hundred pounds this year, but this is unusual and when such is the case, they almost always take a rest next year.

According to Mr. Strowger blooming starts in March and continues until June. During that time he must pollinize the blossoms at least twice every three days as there are only three days that each female blossom is open and can be pollinized.

When the pod which incloses the blossom starts to burst on the side, Mr. Strowger will cut a small piece from the top and insert a few male blossoms which he has carried from the male tree.

One male tree will furnish enough pollen for twenty-five female trees. The pollen from the male blossom inserted at the top of the pod will drop over the female blossoms below, thus fertilizing them.

Most of the fruit ripens in September and the bunches or clusters are so heavy that they must be tied up to keep from breaking off. After picking, the dates are spread on slat trays for three days, then packed in cartons and shipped to Los Angeles.

Mr. Howe has both the soft and dry varieties, and received forty and sixty cents per pound respectively at wholesale. Alkali is abundant in Mr. Howe's grove, but it does not affect the trees. There are hundreds of acres of similar land surrounding this grove.

The Control of Codling Moth.

[Written for Pacific Rural Press.]

"One to two per cent of our apples in the Yucaipa district had worms last year where the growers followed instructions about spraying. Fifty to sixty per cent were infested where instructions were not followed." That is the success of Horticultural Inspector J. B. Hundley's way of controlling codling moth in Yucaipa valley last year where over 5000 acres of apples and 200 or 300 of pears carpet the beautiful mesas. Only a small proportion of these bore fruit last year; but the success in spraying them has determined the growers and the county to give Mr. Hundley almost dictatorial powers on the 2000 acres that will bear this year.

A close inspection of the trees will be made by Mr. Hundley in the middle of March to forecast the number of worms and learn where they will be thickest. The larvae are overwintering in cocoons in protected places under bark or trash in orchards or in packing houses and boxes used last season. They will pupate about three weeks in the spring and emerge as moths which lay semi-transparent whitish eggs singly on the leaves. These are thin as tissue paper and smaller than a

pinhead; so it is hard to see them. Fifty or sixty trees per ten acres will be examined from several directions in order to catch the light just right to see them.

The eggs hatch in five to nine days, and Mr. Hundley wants the first spraying done before they hatch. The blossom petals are usually falling when the worms are hatching. The worms at once go to work on the young apples, almost entirely at the calyx end, whose leaflet lobes are then wide open. The calyxes must have some spray shot into them before they close a few days later; but it is not effective unless applied before the worms get there.

The first spray generally consists

of 2½ pounds dry arsenate of lead and 12 pounds atomic sulphur per 100 gallons of water. Dry arsenate is considered easier to handle. The sulphur is intended to stop mildew; and one application is usually enough. If it is bad, the sulphur is used with the later arsenate sprays. No scab is known on the Yucaipa fruit.

"It is not the brand of spray, but the method of its use that counts," says Mr. Hundley, who with an assistant this year, must inspect the spray rigs working. He aims to be with each rig twice a day. There were 24 power rigs in the valley last winter and several more were being bought by associations of growers. Only power sprayers at high pressure are allowed for this work, and the hose men must walk all around a tree to get every side and every apple. Spraying from one or two

sides only is not effective.

A second spray 10 days after the first takes care of the holdovers from the first brood. After that, the fruits only are watched for eggs of the second brood. Spraying must be repeated when they are found in numbers, for this brood and the next often get a crop on which all the expense of production is lost for lack of the extra spraying. Eggs of the third brood are then hunted, on the fruit. Last year some spraying had to be done Sept. 1. The third brood has been found ever since Mr. Hundley has been in the Valley—four years.

Fresno Horticultural Commissioner F. P. Roullard says that many fig nursery stock growers are not keeping careful record of the cuttings they are planting. Purchasers of trees not true to name can prosecute as long as seven years after buying the trees.

Citrus Trees with a Pedigree

After all, Mr. Planter it is quality and quantity of fruit produced and sold at a good price that will make money for you. Trees that will bring this result cannot be grown cheaply—you can buy cheap trees and save money now, but they will be costly, very costly when they come into bearing. Trees that are budded right will prove their superiority the first crop of fruit they produce. We have spent 20 years with Citrus Trees—were among the first to advocate bud selection from fruit-bearing wood—they were guaranteed disease free and true-to-name.

FRUIT THRIPS EMERGING.

[Written for Pacific Rural Press.]

Now is the time to look out for thrips. It is time for the adults to be emerging from the ground ready to lay eggs in the soft tissues of developing buds. They may damage prunes, pears, plums, cherries, or peaches. Almonds and apricots are less damaged.

To tell easily when they are emerging, lay sheets of cheese cloth on the ground under fruit limbs. The insects can be seen crawling on the under sides of the sheets. If in great numbers, they are likely to do considerable damage. Eggs are laid through a period of several days. They hatch about five days after being laid and begin to feed, damaging and sometimes destroying the blossoms and more often damaging the fruit.

The good result of spraying was shown in an orchard near Campbell where the team on a spray rig ran away leaving 10 or 12 trees half sprayed. Six trees at the ends of those rows were sprayed. There was a striking difference on the sprayed halves of the 10 or 12 trees over their unsprayed halves.

W. H. Stuart finds larvae before he sprays. A hoop covered with black cloth is held under branches while they are tapped to shake the white pink-eyed worms out. He also looks for leaves crimped like frost-bitten or burnt which show the larvae are working.

Then a 3 per cent distillate emulsion mixed with a pint of Blackleaf 40 per 200 gallons of spray is applied with at least 175 pounds pressure and a Bordeaux nozzle. The force of such a nozzle knocks many thrips to the ground, the oil emulsion pierces the oily covering of the thrips' bodies, and the tobacco kills them. Stronger emulsion might injure the blossoms.

Spray should be applied from the bottom of the tree upward in order to touch all larvae, many of which otherwise would drop unharmed into cracks in the ground, to come out again next year.

SAVED BADLY SPLIT TREES.

[Written for Pacific Rural Press.]

A whirlwind split a young apricot tree to the ground for C. J. Oswald of Kern county, and laid the pieces flat in four directions, but all connected to the stump by strips of outer wood and bark. The trunk was about four inches in diameter. All the pieces were straightened back into place, the top cut back severely, and a $\frac{1}{2}$ -inch bolt put through the trunk where it seemed most useful. Holes were bored in the limbs big enough for a 3-16-inch wire to reach across. The wire was fastened by using washers on the outsides of the limbs and making the ends of the wires into knots to fit against the washers. Where the pieces did not fit the trunk closely because of splinters, the latter were cut out smoothly and all surfaces and cracks varnished. The cavity trimmed out is now partially covered with new growth, but must be filled in with cement and waterproofed with asphalt. The healing was not quite so smooth and strong as desirable on account of the work having been done by lantern and also because of the limbs working somewhat in the

wind; and one limb died; so another scheme was tried when another tree split off in two directions leaving the center too thin to hold the remainder of the top erect. It had considerable fruit, for these little whirlwinds come there only in summer.

After cutting back the top and refitting the split-off surfaces, the whole trunk was wrapped tightly with rope and the limbs braced as before. The rope was not loosened until the bark showed a tendency to grow between its coils. Then it was loosened slowly and the tree is in

good shape. This is much better than to lose the tree and have a long struggle trying to get another to grow in its place. The same system has saved several limbs also, that had been split off, and results demonstrate its success.

Cutworms in Vineyard.

To the Editor: Have you anything new for the cut worm in vineyards? I have always been against the use of poison mixtures; but when I lose 15 or 20 cars of grapes I need something. They tell me that after a few days the poison bait becomes harmless to chickens. One man tells me he used tanglefoot at \$1.25 per gallon successfully (cost \$40 for 15 acres). We turn up quite a few cutworms now around the base of vines. Blackbirds get lots of them.—J. G., Clovis.

Nothing is known better than poisoned bran applied at the right time and in the right place. We have never heard of chickens eating poisoned bran with impunity. Notice the economical way a grower uses tanglefoot for his fruit trees as told in a current issue of Pacific Rural Press. De Lano Bros. of Fresno use poisoned bran effectively while the buds are still hard, for the worms are working when buds swell. About

40 pounds of bran fixes six acres—a good tablespoonful per vine. One man applies it to four acres of vines per day, distributing the required amount by a swing with the hand on two sides of the vine so it will encircle the base of the vine, and putting some on top of the vine for the worms which stay all day under shaggy bark or in protected places. De Lano Bros. figure that the loss of two buds per vine would cost them more than the poisoning. Mix 40 pounds of bran dry with two pounds paris green. Mix about two gallons of molasses or sugar syrup in six gallons of lukewarm water and add slowly, mixing it well to get some poison on every flake. Since the bran is not attractive to worms if dry, some people mix in a little cheap glycerine to keep it moist and seductive.

Nurserymen's Association Notes.

Leonard Coates of Morganhill, president of the California Association of Nurserymen, issues an appeal to the membership thereof to get busy in these lines:

There has sprung up an organized effort to have appropriated by our State Legislature a sufficient sum of money for the establishment of an

experiment station (to be located at some point in California best suited for experimental and research work) in relation to deciduous fruits. The movement has been inaugurated after a careful consideration of the necessity and practicability of such an institution, and the equity of the use of State money for the purpose, in the light of the importance of deciduous fruit growing as compared with other branches of California agriculture. Will you write your representatives at Sacramento at once, just a line, urging them to support a bill for this purpose?

Dr. J. Eliot Coit has consented to address the Nurserymen's Convention in San Jose October 11 to 13, on "Selected or Recorded Fruit Trees," and Prof. E. B. Babcock will co-operate. Dr. Coit wishes the convention to go in a body to Berkeley from San Jose on Saturday, October 13, 1917, to be present at the Hilgard Hall dedication exercises, and Dr. Babcock would like us to take up the above subject with Dr. Coit at Berkeley on that day, instead of San Jose. Decision will be announced later.

MOVING BIG ORCHARD TREES

[Written for Pacific Rural Press.]

A dozen orange trees six inches in diameter, moved in February, 1909, by Otto Eisebraun of San Bernardino county, bore some fruit two years later and their tops are now nearly the size of the other trees of the same age and are bearing a good crop. The heads were entirely sawed off where the cuts would not be over two inches in diameter. A trench two feet deep was dug around each tree about three feet from the trunk. The main roots were chopped off and a long chisel was shoved between the roots to cut off the tap root. Mr. Eisebraun then loaded the tree on his back and carried it across the orchard. Each tree was marked so it was reset with its southwest side to the southwest, just on general principles. After planting, each tree got a barrel of water and a coat of whitewash to prevent sunburn.

The British Government has graciously consented to our exporting dried, preserved and canned fruits to Norway.

Growing Quality Tomatoes Economically.

[Written for Pacific Rural Press.]

S. Dalforno of Merced county shipped 3500 20-pound boxes of tomatoes last year, having set out 14,000 plants on his adobe soil. He expects the same this year. His system of culture is worthy the attention of everyone who cares for quality in tomatoes.

The plants were transplanted in mid-February from hotbeds to cold frames, being set an inch deeper than they were in the hotbed, but not over the seed leaves. They were transplanted to the field in April when about 12 inches tall, having already in some cases had their laterals taken off. The plants were put one foot apart in trenches three feet apart and were set about six inches deep. A light irrigation was given at planting, the ground being cold. A stake about four feet high was placed beside each plant which was tied to its with coarse string. About 10 to 15 days after the first water-

ing, a heavier irrigation was given, as the ground was warmer then. Through the hot weather water was given every three or four days; since lack of water would permit sunburn. After the first irrigation, ground was cultivated toward the vines to keep water away from them.

As they grew, they were suckered three times in the season, leaving only one leader to grow up beside the stake. Its terminal bud was pinched off at four feet high and the energy of the plants went mostly into producing fine, big, smooth, clean fruit. If the plants were not tied to the stakes, they would be lying in the water, the tomatoes would be rotting, the vines tramped on in picking. The stakes and staking more than paid for themselves in increased quantity and quality of crop, as well as labor saved in picking. The tomatoes set in three distinct crops a foot apart on the vines.

BEANS FOR MADERA.

To the Editor: Which beans would you plant in the Madera district and how many pounds per acre? The soil is good and has been flooded, but there is no irrigation. Do black-eyes stand hot weather? How far apart do you plant seed in the row? Will April 1 be too early to plant?—Subscriber.

[Answered by J. E. Hawley, Madera.]

I have tried to raise pinks, little whites, and bayo beans, but did not have any success with any of them. Some of the neighbors, however, planted a little later than I did (about June) and raised a fair crop of pink beans by irrigating them; but the frost would sometimes catch a part of the crop before they had fully matured. About twenty-five pounds was planted to the acre here.

I have not seen the Tepary bean tried out in this locality yet. The blackeye is the best that I have tried or seen tried in this locality. Under favorable conditions they will mature excellent crops; will stand a great deal of abuse and yet mature something.

Plant the rows about thirty inches apart and three to four inches apart in the row, sowing about twenty-five pounds to the acre. Do not sow before May 15. The soil must be thoroughly warmed up before they should be planted, as they are a warm weather plant.

SOWS ALFALFA IN MARCH.

To the Editor: What is the latest date this spring that alfalfa can be planted on the high, red adobe, land near Nicholas, Sutter county?—L. M. G.

[Answered by E. A. Noyes, Sutter City, Cal.]

Have never sown alfalfa on such land as you describe. Have sown on sandy and black adobe lands. I always sow on this land when possible any time from Mar. 1 to Mar. 15. Have seeded land as late as April 12 and got splendid stand. Think your question best answered by saying it all depends on the lateness of the spring rains.

The great traveling exhibit of the Home Industry League of California will first be shown at San Jose Apr. 13 to 22. It will then be shown at Sacramento May 4 to 13.

DISINFECT POTATOES BEFORE CUTTING.

To the Editor: In your issue of Feb. 17 you gave a formula for dipping potatoes to prevent scab. I have 10 sacks of seed potatoes ready to cut and intend to dip them after cutting. How many days after cutting are they dry enough for dipping? Can I seed them right away after dipping?—D. S., Marysville.

It will do no practical good to dry the pieces before dipping, and you can seed them as soon as you take them out of the formalin. But don't expect results if you won't follow directions. Our directions were to cut the seed after dipping and drying them dry. In cutting infected potatoes you will likely spread infection to cut surfaces which will stick together in the bath and not be disinfected.

A movement for dissolution of the Sacramento and San Joaquin Valley Drainage District was given impetus recently by organization of farmers in the Gridley district.

Grain Sorghums in California.

[Written for Pacific Rural Press by Prof. B. A. Madson, University of California.]

The rapid development of the livestock industry, together with more intensive methods of farming which have taken place during the past few years, has created a demand for crops which will produce a dependable quantity of feed and forage during the summer months. The crop which thus far has shown the most promise in filling this demand is the grain sorghums. Experience has shown that as a class they are excellently adapted to our climate, and are quite resistant to drouth. In a like manner they permit a considerable latitude in the choice of soil types so long as the seed bed is well prepared and the soil kept in good tilth throughout the early part of the growing season. Obviously, however, extremely heavy soils, because of the poor physical condition, or extremely sandy soils, because of their low water holding capacity, are not as desirable as the more free-working loam types.

In order to answer more fully some of the questions which have arisen regarding the adaptation of the various varieties, as well as the best methods for their production, a series of experiments with the grain sorghums were begun at the University Farm in 1914. While the information thus far obtained cannot be regarded as conclusive, the results may be of value to the farmer who is looking to the grain sorghum as a partial solution of his feed problem.

Varieties.—The variety test with grain sorghums included not only the common varieties but some of the more recent introductions as well. The average yields obtained for the past three years are given in the subjoined table.

Variety.	Yield per acre, lbs. Av. 3 years.

Shallu	3542

Characters of the Groups.—It will be observed that the group headed "Durras" has, on the whole, given higher yields than either the Kafirs or the Kaoliangs. As a grain crop the Dwarf Milo has been far superior to any of the other varieties, being followed by Standard Milo, to which it is closely related.

The White and Brown Durras, which were the first grain sorghums to be introduced into California, both gave lower yields than the Yellow Milo. The extremely poor yield of the White Durra is due largely to the fact that it shatters badly and is also badly attacked by birds.

Feterita, a rather recent introduction, has created considerable interest during the past few years, but in this test has been inferior to both the Milo and the Brown Durra. Its seed is rather soft, and difficulty is often experienced in securing a good stand unless the conditions for germination are ideal, and this fact may account for the poor yield obtained.

All the varieties of Durras have been grown commercially in this State. As a class they are excellent grain crops, being early maturing and extremely drouth-resistant. Because of their dwarf stature, however, and dry, leafless stalks they cannot be recommended highly as forage crops, though the milos are better in this respect than the other types.

Of the Kafir group the only variety which has been grown to any

extent is the Black Hulled White Kafir, a rather large, leafy, later maturing variety. As a grain crop it is not as good as the Durras, but because of its leafy character and larger growth it is often preferred where both grain and forage are desired. The Dwarf and the Early Black Hulled Kafir are both selections of the former variety. They are earlier maturing and somewhat more drouth-resistant, and for this reason are usually more prolific in their yield of grain, but as forage crops they are little better than the Milos.

The Kaoliangs, or Chinese sorghums, have not been grown commercially in California as yet. As a class they are early maturing and are usually believed to require less heat than either the Kafirs or the Durras. If this is true, they might be of value at higher elevations or in sections where the growing season is too cold for the other types. Limited trials, however, are recommended before their production on a large scale is attempted.

Shallu, more commonly known as Egyptian wheat, has been grown to a considerable extent in various sections in the state. It is a large, relatively late maturing variety with very loose open heads. Where the moisture supply is abundant Shallu will usually produce good yields of grain. It has been found that on soil of poor physical condition it is usually easier to secure a stand with this variety than with the other types, which appears to be due to the high degree of vitality possessed by its seed. For this reason it is usually recommended for the more unfavorable soil types, but under favorable conditions, cannot compete with Milo.

Culture.—Though the grain sorghums are drouth-resistant we should not lose sight of the fact that the yield which will be obtained will usually be in proportion to the condition of the soil and the amount of moisture available. For this reason too much emphasis cannot be placed upon the storage and conservation of the moisture supply for the use of

the crop during the growing season. When possible the land should be plowed in the fall or early winter to a depth of eight or ten inches and allowed to lie rough until spring. In this condition it will absorb a large proportion of the winter rainfall and will also be materially benefited by the weather action. Unless the field is very weedy no further treatment will be necessary until the seed bed is to be prepared, which can be done with a disc and harrow. If spring plowing becomes necessary it should be more shallow than fall plowing, otherwise too much moisture will be lost by evaporation and difficulty will be experienced in preparing the land for seeding. The seed bed itself should be firm with a smooth, uniform mulch of about two inches on the surface. This condition is imperative as the seed of the grain sorghums is rather soft and rots easily if the soil is too cold or porous, or the moisture supply insufficient for prompt germination.

The time of seeding varies to some extent with the location and the character of the soil, but it should not be done until the soil and atmosphere are quite warm. Results obtained at Davis indicate that it is seldom wise to attempt to plan before the middle of April, not later than the middle of May unless irrigation can be provided.

The common method of planting is to use a corn planter fitted with sorghum seed plates, the seed being drilled in rows three and a half feet apart, and spaced from four to eight inches in the row. The rate of seeding should always be in direct proportion to the supply of moisture, and the amount usually required will be from five to seven pounds per acre. In some cases the grain drill has been used for planting the crop by stopping up enough of the holes to give the proper spacing. This implement, however, is not to be recommended as it seeds both too heavily and too shallow for any but the most favorable conditions. The seed must be placed below the surface mulch in contact with moist soil where it will quickly absorb the water necessary

for germination. This will usually be at a depth of from two to three inches. If the seed bed is rough and open, however, as is often the case on spring plowing, deeper planting may be necessary, though the maximum depth on normal soils is approximately four inches.

The attention necessary after the crop has been planted will depend upon the condition of the field and the season. While the plants are small any weed growth which may occur on the field can best be destroyed by the use of a harrow without severe injury to the crop. This implement may also be used for breaking the crust, but a better implement to use for this purpose is the corrugated or Dunham roller, the action of which will be less injurious to the plants. As soon as the plants are large enough so that the rows can be plainly seen, the field should be cultivated to a depth of four inches with a common two-horse corn cultivator. For this purpose an implement with rather small shovels is to be preferred since it is more effective in destroying young weeds, and leaves the mulch more uniform. Two to three similar cultivations should be given at intervals of two to three weeks, or until the plants begin to head, after which no further attention will be necessary.

When the seed is ripe the crop is usually harvested by hand, cutting off the heads and spreading them out in a dry place to cure before threshing. A good practice in curing the heads is to spread straw on the ground to a depth of six to eight inches and then to spread the heads on the straw to a depth of not more than one foot. This curing process is necessary to prevent the seed from heating when placed in sacks. When taken from the curing beds the straw may be run through the machine with the grain, thus preventing the usual loss due to shattering.

Grain Sorghums in the Rotation.—The use of the grain sorghums in the rotation has been a rather perplexing problem to some, especially as they have the unsavory reputation of being "hard on the land." Just why this is true is not definitely known, but it has often been observed that when the sorghums are followed by a rapid-growing crop such as barley, that the yield of the latter will not be as good as if preceded by some crop other than sorghums. Tests at the University Farm, however, have shown that if a couple of months elapse between the time the sorghum is removed and the seeding of the barley, no detrimental results will follow. It is usually advisable, however, to plow up the sorghum stubble as soon as the crop has been removed as aeration will then be more thorough and the injurious effect more readily overcome.

Another system of cropping which is finding some favor where irrigation can be practiced is to utilize the grain sorghums as a second crop following grain hay. The hay crop is removed in May or early June and the land irrigated and plowed and planted to sorghum. For this purpose an early maturing variety such as Milo, White Egyptian or Feterita should be employed to avoid the danger of the crop being injured by frost in the fall before maturity. If these varieties can be planted before

June 15th they will usually mature in most sections of the State before fall frosts occur.

Value as Feed.—But little information concerning the feeding value of the grain sorghums is available, especially as compared with the more common cereals. Such experiments as have been conducted, however, indicate that whether fed as grain or in the form of fodder, stover, or silage, they compare favorably with corn. As a grain feed it is pretty well understood that there is some difference in value between the various varieties. Brown Durra and Kafir are prone to have a constipating effect on the digestive system of animals unless fed with a more laxative feed such as oil meal or alfalfa. With the White Durra and the Milos, however, no effect of this character has been noted, a fact which renders these varieties especially desirable as poultry feeds.

The utilization of the grain sorghums as a feed for farm animals is of the utmost importance as it will unquestionably prove to be the most profitable disposition which can be made of the crop. From the results thus far obtained there is every reason to believe that as the use of the crop becomes better understood it may in time hold the same place in the semi-arid West as that held by corn in the corn belt.

COAST POTATO GROWING.

[Written for Pacific Rural Press.]

While potatoes are not his main crop, in fact are only incidental to his dairy operations, J. D. Williams of Bodega, Sonoma county, always has a few acres planted to that crop despite the fact that commercial potato growing on a large scale was abandoned in the section years ago because of decreased fertility from continuous cropping.

Potato planting with Mr. Williams begins in May or the first part of June according to the season, after the land has been put in first-class condition by two plowings and liberal harrowing. If the ground is a little rough it is gone over with a roller to break up all clods.

Before plowing in the spring, usually about February 1 or a little earlier, the land is treated to a heavy coating of barnyard manure. This enriches the soil but does not damage the tubers as it would if applied immediately before planting. To further increase the fertility commercial fertilizer has been used in the hills at planting time some years.

Golden Coin is the variety which has produced the heaviest and most desirable tubers under Mr. Williams' conditions, good clean seed being purchased each year.

Thorough cultivation is practiced as soon as the plants are above the ground till such time as they cover the ground, the tubers ripening in October or November.

The yield the past year averaged about 87 sacks to the acre and owing to the high market prices that have prevailed most all of them were marketed. Ordinarily, however, they are graded in the field into two sizes, the smaller ones being used for cow feed in years of low prices, as Mr. Williams has found them to be an excellent feed for dairy cows in connection with other feeds.

SUPPORT UNIVERSITY FARM.

After careful consideration of all the facts available with reference to the University Farm, the Sacramento Valley Development Ass'n strongly recommends appropriation by the Legislature of \$250,000 substantially as recommended by Dean Thos. F. Hunt of the College of Agriculture. The items are given below:

Creamery	\$100,000
Building and Equipment for Animal Husbandry	60,000
Water supply, irrigation, distribution, sewerage disposal and fire protection	15,000
Minor structures and repairs	15,000
Agricultural Engineering	50,000
Green houses	10,000
Total	\$250,000

Says the Development Ass'n: "We believe that the importance of the work at Davis warrants the large amounts asked in these bills. This work is educating the farmers of this State and the young men of the State who are going to be farmers. The increased appropriations for which

A Yuba Tractor

coasts like a sled. Most of the power generated by the engine is delivered at the draw-bar—where you need it.

The rigid steel frame travels over highly polished steel balls. The track is rigid—and there's no slack to take up—the force isn't wasted—it's conserved.

LIGHT DRAFT PLOW

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Tractor Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P & O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

Senator Sorghum, a California Pioneer.

(Continued from first page.)

better than Salazar's—granulating well and making an excellent quality of white sugar," but nothing is said about the process which made it white! True sugar cane has been growing in small quantities in many parts of the State since that time, but has never reached commercial standing except for chewing. Incidentally, it should be noted that in 1857 a small exhibit of beet sugar was made at the State Fair and thus began the long and interesting experience in winning for California priority in this country in the commercial use of the beet for sugar—but that is another story.

The "Chinese Sugar Cane" Tragedy.—It was probably due to the fact that early Californians had eye and heart on true tropical sugar cane, for the reasons just stated, that the State fell so precipitately into the saccharine-sorghum delusion. There was in 1855 a large introduction by the U. S. Patent Office of sorghum seed from China under the name "Chinese Sugar Cane." Wide distribution was made in this State, for California even then had a reputation as the place where everything wonderful came through to perfection. For this reason the country expected more from Chinese sugar cane in this State than in other parts of the country where free distribution of seed was also made. So far as the growth of the plant is concerned this anticipation was fully realized. In his address at the State Fair in September, 1857, William Garrard, president of the State Agricultural Society, said this:

Of the Chinese sugar cane, out of many packages of seed distributed by our society, not an instance is known where the crop failed to mature whether irrigated or not, and in some localities, as at Mr. Campbell's on Kings river, it has reached a perfection unknown in other States.

In September, 1858, the California Culturist, a pioneer journal, generalized and specified as follows:

The Sorgho or Chinese sugar cane so widely distributed within the last three years, so highly valued by many and condemned as worthless by not a few, at least in the Atlantic States, has had during the last two years very fair trial in California and from every section of the State the most flattering reports have been received. As far north as Tehama county, Newell Hall has grown the plant to perfection and with a very simple arrangement for expressing and concentrating the juice has made a very good quality of syrup, fully equal to any molasses of commerce.

In that year also B. D. Wilson grew in the San Gabriel valley forty acres and was credited with being "entirely successful in making syrup and sugar from Chinese sugar cane." Also at the State Fair of 1858, J. C. Fall, president of the society, said this:

Successful experiments upon the growth of sorghum justify the qualifying expectation of those who have turned their attention to that praiseworthy and remunerative branch of husbandry, the manufacture of sugar.

The wish fathered the thought, for California was then importing about five million dollars' worth of sugar a year from Central America, Hawaii and Manila, and from the Eastern refineries also. It seemed to be game worth bagging. Ordinarily prizes were given for cane

samples at the State fair, and in 1859 there were "several kinds of cane crushers on sale in San Francisco." Evidently heavier guns must be used to get the game! The State legislature in 1863 passed a law to see if home-grown sugar could be legislated into being. The first thing mentioned in this law was this:

For 100 bags, of 100 lbs. each, of sugar from sorghum the State will pay a bounty of \$500; for the second year, \$250; for the third year, \$150; for the fourth year, \$100. For the first 200 bbls. of molasses from sorghum, \$200. The same awards are for sugar from the sugar cane and from the beet; for 200 bbls. of molasses from sugar cane, \$500.

None of these bounties were ever claimed and the law was repealed in 1871. Before that, however, viz., in 1867, the game was counted up, for in that year H. D. Dunn wrote:

Chinese sugar cane or sorghum has been cultivated to a comparatively large extent in previous years. The difficulties attending the making of syrup by new hands and the large expense entailed by way of machinery and pans has been a great drawback to its culture. So far as known no sugar of consequence has been made and as a general rule, from the ignorance of those making it, the quality of the syrup offered in this market has been quite inferior and slow of sale at unremunerative prices.

There was a revival of interest in sorghum molasses during the latter '70s and early '80s when Peter Collier's quest for sorghum and corn stalk sugar was causing large expenditures for laboratories and factories to secure sugar for 1c. per lb., improved varieties were introduced and some sorghum molasses was made with little profit, as in fact there has been scattered small production ever since, but the life really went out of sorghum as the basis of a sugar industry for California nearly half a century ago.

Sorghum for Forage not Sugar.—But though the play of sorghum sweets for mankind turned out to be an industrial tragedy sooner here than elsewhere, it was early seen that for other purposes California had made a great gain by securing the plant; and to note that, requires turning back over the years which denied the sugar. In 1857, in the midst of the sweetest anticipations, in his State Fair address Henry Eno of Campo Seco, Calaveras county, voiced this foresight:

If Chinese sugar cane cannot be successfully cultivated for the making of sugar and molasses it is believed it will prove of immense value for forage and that if cultivated for that purpose alone it will well repay the labor of the farmer. At least two crops can be raised in a year. I have known it this year, planted May 10, to have reached a height of 10½ feet by August. It was then cut down and a second growth started which was six feet high in September. It was irrigated.

And a year later Elam Brown of Lafayette, Contra Costa county, declared that he had "found no other known plant at present grown in California that can equal Chinese cane. Whether profitable as a plant to be converted into syrup or not, its value as food for stock will secure it a permanent place in our list of valuable farm products." And in the same year B. D. Wilson of Los Angeles county, who had forty acres

and is credited above with making sugar from it, adds this: "The produce of the cane is abundant beyond anything ever experienced, either as to its yield as cane, as fodder for cattle or seed which fowls eat with avidity."

The Non-Saccharine Sorghums.—During the sugary struggle above outlined, Californians had acquired about all the sorghum varieties which made any claim to saccharine standing, from the original Imphee, renamed in this country like the Early Amber of the great sorghum apostle Cyrus Kenny of Minnesota to the Early Orange of Collier, etc., and it is upon these and other offshoots from the old "Chinese sugar cane" that the foregoing conclusions on forage and seed values were based and are to some extent still predicated. But since they passed the zenith of their fleeting fame, as sugar producers, another and quite different branch of the sorghum family has come into greater prominence than the earlier branch ever reached, and is now advancing into still greater public service and importance. From their having neither record, ambition nor prospect in sugar lines they have been called the "non-saccharine sorghums." Their value is in grain and forage—the latter green, dried or siloed.

California Priority with Durra.—Prof. E. G. Montgomery in his book, "The Corn Crops," says: "The cultivation of non-saccharine sorghums dates from the introduction of white durra and brown durra into California in 1874 and the introduction of kafir in 1876, but they were not generally distributed until about ten years later."

This concession to California of priority in the introduction of the variety which we have always affectionately called "gyp corn," is based apparently on the fact that in its issue of September 19, 1874, the Pacific Rural Press described Egyptian corn as grown by R. J. Trumbull of San Rafael from seed which he, as a dealer in seeds, had introduced at the suggestion of Dr. J. S. Silver, "who had tested the grain in Egypt." We remember Dr. Silver as a picturesque old Californian of globe-trotting propensities who was always ransacking the earth for things which might be good for California. It is perfectly natural that he should have prompted this introduction. In our account of September 19, 1874, the plant is spoken of as an "agricultural curiosity" and described in detail, including its "bunches of grain hanging downward."

But we are not absolutely sure that the above mentioned introduction was really the first. Upon the publication of detailed accounts at the date stated, with full description of the plant, "gooseneck" and all, the San Diego News said that a party in that county has been growing it in a small way since 1863, and considered "one acre of Egyptian worth 25 acres of barley because one can irrigate that much from a well and keep two or three horses and several milch cows every year independent of drouth." It is possible that he had one of the old saccharine sorghums—but perhaps he really had durra. However that may be, it is not the first of its kind. A sturdy pioneer, Stephen Cooper, who was honored by his contemporaries as

the man who broke the first trail from the East over the Rockies to New Mexico in 1822, was resting from such labors on his farm near Colusa in 1858 and we have the record that he said in that year: "I grow Chinese sugar cane and Egyptian millet. They are much alike, but I prefer the latter both for grain and fodder."

We have also a statement of September, 1871, that Gorman & Sweet of John Day river, Eastern Oregon, had been growing "English rice corn, with grain growing not in the ear but on the tassel" which was good for stock and "yielded 80 bushels per acre where Indian corn yields but 30 bushels." They received 21 seeds in a letter from the Eastern States to start with. Now "rice corn" is an old name for durra and perhaps this is what they were growing in the later 60s.

In fact it seems likely that Prof. Montgomery was in error in dating the growth of durra from its introduction to California, for we have before us Killebrew's "Grasses, Cereals and Forage Plants," published at Nashville in 1878, in which, speaking of durra, he says: "About 25 or 30 years ago it could be seen on the plantation of almost every farmer in Tennessee. It gave very general satisfaction and yet it went out as suddenly as it came into popularity. This was due to the cry that it impoverished the land; a verdict which was accepted without question, and its culture was abandoned." It is possible that all the introductions to California and Oregon previous to 1874, which we have cited above, came from this discard in the Tennessee-Missouri region, which Col. Killebrew noted much earlier than the California direct importation of seed from Egypt; also that its killing the land for a following crop, of which the Imperial valley growers made such loud outcry some years ago, is not very new either; nor very true, if the crop and the land are skillfully handled.

California Gives Grain Sorghums a New Start.—It is, however, more important and true that California gave the non-saccharine sorghums a new start and a winning start—just as it did that other royal plant, alfalfa. This new start in California in the '70s was quick and strong. Before the end of the decade it was widely grown and appreciated. Isaac A. Grout, in January, 1878, wrote:

I was first to introduce Egyptian corn to the Central California Colony, but farmers outside planted it on small scale with great success. I consider it the best crop for the valley as it requires but little water.

It was then at this pioneer colony of the Fresno district that grain and forage sorghums first demonstrated adaptation to the needs of small farmers in our interior valleys, which is conspicuous to this day. And it was upon the demonstration by the colonists that large production was later undertaken and found profitable. But in California the planting of sorghums has usually been for temporary needs, the land soon going into alfalfa or fruit growing. For this reason the crop in this State has not reached the large figures of Kansas, Oklahoma and Texas—the four States indicated constituting nearly the whole grain and forage production of this country—largely because in the southern extensions of

WHAT EVERY FARMER WANTS

Cheap and Efficient Transportation His Great Need—How It Can Best Be Assured.

THE present situation of the railroads presents two alternatives, efficient federal regulation or federal ownership.

The experience of other countries proves conclusively that government ownership of railroads is more costly and less efficient than the system of private ownership in this country. The railroads of the United States have the lowest freight rates, the smallest capitalization per mile, the highest operating efficiency, and pay the highest wages of any railroads in the world.

High Rates on Government Roads

The charge for hauling a ton of freight one mile on the government owned roads of various countries and on privately owned roads of the United States is shown in the following table:

	Average Freight rate per ton mile
Germany (Gov't Railways)	1.24 cent
France "	1.30 cent
Australia "	
New South Wales "	1.59 cent
South Australia "	1.75 cent
Switzerland "	2.63 cent
Canada (Private ownership)	.76 cent
United States "	.73 cent

No railway system under government ownership can show a record for cheapness and service approaching that of American Railroads under private ownership. What the railroad situation needs is the adoption of a system of national regulation that will encourage initiative and investment and enable the carriers to meet the growing requirements of American business.

Keep Railroads Out of Politics and Politics Out of the Railroads

It is to the interest of the railroads and the interest of the whole country that the railroads keep out of politics and that politics be kept out of their management.

Government ownership under our political system would make the control of the railroads a partisan issue at every election. It would bring political and economic disaster.

No man in the country stands to lose more by the adoption of a political system of railroad management than the farmer. None will profit more from efficient national regulation that will do away with the present conflicts and waste of local control and enable the railroads to make the extensions and improvements necessary to keep pace with the business progress of the nation.

We invite discussion of this question and shall be glad to answer questions and to supply information on request.

General Agricultural Review.

OF GENERAL INTEREST.

Fresno Fair October 1 to 6, 1917.
Fresno Pure Food and Household Show Mar. 21 to 31.

Butte county farmers and business men have been seeking a farm adviser.

Potash production in U. S. in 1916 was 10 times as great as in the preceding year.

Kings County Fair is to be held at Hanford during the week beginning Sept. 24.

Machinery for a potash fertilizer plant is on the grounds at Mayfield, Santa Clara county.

The Healdsburg High School Agricultural Club recently formed will contest in potato growing.

Boycotts of high-priced provisions have sent the prices tumbling not only in Eastern cities but also in the West.

A total of 2780 vessels with cargo of 11,652,405 tons passed through Panama canal between Aug. 15, 1914, and Jan. 1, 1917.

The State experimental dry farm in Elko county, Nev., is to revert to the county if a bill passed by the senate becomes a law.

The Nevada State Legislature has asked Congress to build a military-commercial highway through Feather River Canyon from Nevada.

An appropriation of \$5,000 per year is asked for State weed control work under direction of the State Horticultural Commission.

Public subscriptions to the twelve district federal farm loan banks was \$130,000, leaving \$8,870,000 to be taken up by the Government.

A ten-acre experiment farm near Calipatria is to be planted with every kind of tree or plant likely to show promise of profitability.

Chico business men have guaranteed the Butte County Spring Exposition up to \$5,000 in case they stand a loss due to weather, fire, etc.

Ninety-three per cent of all the water for which the State Water Commission received applications in the past two years was for agricultural purposes.

San Joaquin Valley assessment values of agricultural products were increased 40 to 100 per cent as agreed by assessors in a meeting at Fresno recently.

The proposal to divert the waste water of the Alamo for use in District 3 of Imperial Valley is being opposed by growers in the north and who get this water free of charge.

The Reno, Nevada, Rotary Club is boosting for the bill before Congress to prevent railroads charging more for a short than for a longer haul on the same line in the same direction.

A district fair for Southern California will be staged at Exposition Park, Los Angeles, next fall if a bill in the Legislature providing a revolving fund of \$100,000 for the purpose is passed.

"It is just as important for the farmer's wife to understand something about agriculture as about domestic science," says Dean Thos. Forsythe Hunt of the California College of Agriculture.

It is said that there are in Los Angeles county 65,000 colonies of bees and that the output of honey and beeswax is worth \$175,000. Profitable and healthful employment is given to 2500 persons.

Bonds of the Alpaugh Irrigation District to the amount of \$180,000 have been validated by the State Bonding Commission and the securities have been sold to Aronson-Gale Company of Los Angeles.

At the California Wild Flower Show to be held in San Francisco April 24 to 28, 1000 different kinds of wild flowers are expected, and they will all be labeled with their com-

mon and scientific names. Last year there were 900 kinds.

The State Agricultural Society has elected these officers for the ensuing year: President, J. M. Perry, of Stockton; vice-president, Ellis Franklin, of Colfax; secretary, C. W. Paine of Sacramento; treasurer, I. L. Borden, of San Francisco.

Pests were intercepted by the State Horticultural Quarantine office in January, 1917, from the following countries: China, Hawaii, Japan, Java, Holland, Sydney, and Mexico, and from the States of Ohio, Idaho, Oregon, Texas, and Kansas.

It is proposed to line 100 of the 145 miles of ditches in the Orland project with cement, the Government to pay the bills and charge the cost to the property to be paid back in 19 annual installments. This would make the cost of the total irrigation project \$55 per acre.

The Western Pacific Railway is authorized to buy a controlling interest in the Tidewater Southern Ry., which will let the Western Pacific still farther into San Joaquin Valley. There are also rumors that they expect to extend to Mendota and thence through Panoche Pass to Hollister and Monterey.

Where moisture is the limiting factor, the conservation of one inch of rainfall is equal to about 2½ bushels of wheat per acre or its equivalent in other crops, says Henry Holtz of the Washington Experiment Station. Early spring disking and plowing and harrowing are the first means of saving the moisture.

The disgraceful, degrading, and humiliating gambling wheels, teddy bear outfits, etc., that teach children at our State and county fairs the way to get something for nothing, are not to be allowed at the traveling expositions of the Home Industry League of California to be held in all big cities of the State this summer.

The Chamber of Commerce of Santa Ana at a meeting last week passed a resolution opposing the bill now before the State Legislature to put all commission merchants under the jurisdiction of the State Market Director, unless the measure makes it plain that co-operative associations, such as the walnut and citrus interests, are exempt.

The Reclamation Protective Association was organized in Sacramento recently by representatives of 14 counties in the Sacramento and San Joaquin Drainage District. Its executive committee is working for the bill in the Legislature which would permit an election in the 14 counties to determine whether the District will be abolished. The Ass'n opposes the assessing powers of the State Reclamation Board and is circulating petitions to that effect.

The Southern Pacific Land Company of San Francisco has applied to the State Water Commission for 2½ cubic ft. per second of the waters of Millard Canyon near Cabazon in Riverside county for the irrigation of 550 acres. It is proposed to construct a concrete weir dam four hundred feet across the wash with its top level with the stream bed and the bottom extending 10 feet below to impervious strata underlying the stream, for the purpose of cutting off the percolating waters. The estimated cost is \$26,000.

GRAINS AND FIELD CROPS.

An increase of 300 per cent is reported in the acreage of potatoes planted this year around Ventura.

News comes from Van Nuys that packers there are offering to contract tomatoes at \$10.00 per ton the coming season.

Several hundred acres of grain were flooded recently by the breaking of the Lovelace levee in the Tulare Lake region.

Bean buyers are in the field in Sutter and Butte county offering to contract for 1917 crop of Lady Washington beans on a seven-cent basis.

A thousand sacks of Australian wheat were recently unloaded by the Sperry Flour Co. Part of this will be planted on their experimental farm at Farmington.

Spraying is recommended by U. S. Dept. Agr. for sugar beet thrips. Apply nicotine sulphate 6 oz.; fish oil soap 4 lbs.; water 50 gallons—to both sides of the leaves.

The demand and price of rice is improving for both paddy and cleaned. Past prices have discouraged large plantings and it is said that this year's acreage will be much less than last.

It is said that the importations of sugar-beet seed exceed any previous season by 50 per cent. Allen G. Freeman, of San Francisco, says 175,000 bags of seed have been brought into the country so far.

Oxnard reports a recent sale of a car of lima beans there by a grower at \$11.25 per cwt. One rancher who needed more seed than he had saved was asked \$11.50 per cwt., but said that he would plant his land to beets before he would pay that price.

It is said that potato growers around Monrovia are rolling in wealth. One grower is said to have made \$5,000 on a twenty-acre patch. Most of the growers sold their crops in the field at \$2.25@2.50 per cwt., while those that held got \$3.50 per cwt.

Howard K. Pendleton, a Sutter county farmer, allowed an orphan boy working for him to farm a little over two acres on his own account the past season. He planted it in potatoes. He marketed the crop the other day and presented the proceeds, \$1,500, to the boy.

It is reported from Ventura that C. E. Riley of Tulare county, conducting large rice fields near the Tulare Lake bottom for some years past with great success, is investigating land in the Point Magu district which is thought particularly adapted to rice growing.

It is said that growers have contracted with the American Beet Sugar Company for 36,000 acres of beets this year, an increase of 6,000 acres over last year. The acreage in the Oxnard district is 15,000 this year, against 12,000 last year. To this must be added 1500 acres at Newhall which is a new field for beet growing. Much replanting has been necessary this year because of the cold weather. In the San Fernando Valley replanting has been especially heavy.

A peculiar suit coming from the present excitement in the lima bean market has come to light from Oxnard. The J. M. Waterman Selling Agency at Oxnard is seeking an order restraining a local bean rancher from selling his estimated crop this year, put at 9,000 sacks, to any other than the Waterman Agency. It is alleged that on January 30 a contract was closed for his coming crop at \$6.60 per cwt. But since the recent jump in lima bean prices, he has notified the Waterman Agency that he will not live up to his contract.

CITRUS, OLIVES, FIGS, ETC.

The Santiago Orange Growers' Ass'n in Orange County has decided to put up a new packing house, ice-plant, and precooling plant.

Citrus Convention Riverside June 4 to 9 under auspices of State Horticultural Commission, University of California, and the Citrus Experiment Station.

The Lindsay Ripe Olive Co. is considering an addition to its plant so that tomatoes may be canned. Final plans await the signing up of the necessary acreage.

Orange Day March 10. Eat oranges! The Salt Lake Route is giving its patrons orange and lemon recipe books to stimulate consumption by describing a multitude of uses.

A State Fig Growers' Organization seems nearly assured. Many local associations are being formed to hold up contract prices for this year. In Stanislaus county they are holding for 12½ cents.

Because the power of appointing directors of district agricultural fairs is in the hands of the Governor of the State, and the further fact that agricultural district fairs are supposed to be perpetual, State Corporation Secretary Robt. Jordan refused to grant a request for the incorporation of the Napa Agricultural Ass'n.

What is the actual value of a good orange grove? Is a question that is just now agitating the San Dimas community. When B. F. Woodford purchased his fourth orange grove the other day, paying \$22,000 cash for a ten-acre grove near Charter Oak, there was much comment. Mr. Woodford said that in 1915 he paid \$21,000 for a seven-acre grove and since then he has picked \$16,000 from it. The day after Mr. Woodford bought his ten-acre grove O. S. Tillman of San Dimas sold a ten-acre grove near the Charter Oak school house for \$30,000, taking in the deal a residence valued at \$8,000. Two days later Mrs. J. P. Keith sold her ten-acre grove, which lies just west of the San Dimas packing house, to J. A. Crane of Santa Paula for \$20,000.

There was a meeting of orange growers last week at Pomona to discuss heating of orchards. There were nearly fifty ranchmen present. R. S. Vaile of the citrus experiment station at Riverside expressed the opinion that growers light up too early and too often. Instead of lighting up at 30 degrees, wait until 28 degrees are registered. J. D. Culbertson of Santa Paula, where 900 acres of lemons are grown and 65,000 orchard heaters are in use, came out flatly in favor of abolishing the smoke, although F. J. Smith and W. S. Jones of the Pomona district declared themselves in favor of the smoke. R. O. Price of Upland said that the smoke is an essential element in orchard heating. Geo. Laidlaw of Ontario declared when he was a greenhorn at the business he made \$2,000 in one night of Dec., 1912, by burning 1,000 gallons of oil in 1,000 pots.

DECIDUOUS FRUITS, NUTS, GRAPES.

Over 2,000 acres of Thompson Seedless grapes are now planted around Terra Buena, Sutter county.

Placer county strawberry acreage is reported to be short. Most of these berries are grown by Japanese.

A mass meeting of San Luis Obispo county bean growers has asked the State Insectary for ladybugs to control aphids.

It is reported that Phil Baier expects to plant Tragedy plums on a large part of 220 acres recently acquired near Exeter.

The New York Food Supply Committee has wired State Horticultural Commissioner G. H. Hecke asking prices on potatoes and onions f. o. b. N. Y.

The Corralitos Fruit Growers' Ass'n has been packing out about 21,000 boxes of Newtowns which were in storage. Prices are \$0.95 to \$1.05 f. o. b. Watsonville.

The rains while apricots were in bloom in Pajaro Valley were no particular damage as reported by a grower, though moist weather now might seriously reduce the crop.

San Juan Capistrano walnut growers in Orange county have formed an association and will put up a packing house. The district has a normal crop of more than 400 tons of nuts.

Heavy smudging was the rule last week in the almond district south of Chico and it seems probable that the crop has been seriously damaged in orchards where no smudging was done.

Reports from Bryn Mawr say that thousands of apple, peach, pear, and apricot trees are being set out in

upper San Bernardino Valley. It is thought that fully 400 acres will be set out to new orchards.

Apple shipments from Watsonville district for 1916-17 up to March 3 were 212 cars greater than to the same time the previous season. Some 3289 cars had been shipped, of which 1537 went East and 600 to Europe.

Fruit buyers have been busy in the Gridley district of Butte county contracting for cling peaches at \$40 a ton and one report late last week was to the effect that \$42 a ton was offered by one buyer. Prospects are for a good crop in that district.

Contracts for canning peaches were made about the first of March at the rate of \$42.50 and \$45 per ton in the Sutter county district, where the fruit seems to be considered superior, since representatives of most of the big canneries have been competing for it. The crop is estimated at 40,000 tons if about normal.

County Horticultural Commissioner G. W. Harney of Yuba county states that there has already been enough nursery stock shipped into that county to plant 2,000 acres. Mostly this has consisted of Thompson Seedless grapes, French prunes, and Bartlett pears. The nurserymen of Sutter county, he says, have put out six and a half million cuttings of Thompson Seedless vines.

MISCELLANEOUS NOTES.

Bean straw is being used in Ventura county for paper manufacture.

It has been recommended that instead of passing a standardization law for oranges at the present Legislature, a commission of 11 citrus growers be instructed to investigate and report two years later to the Legislature.

According to W. R. Wiles, squirrel inspector of Fresno county, over 90 per cent of the farmers there are now co-operating with him in an attempt to exterminate squirrels in that section. He states that the cost of extermination is about 10 cents per acre.

A large rice grower of Butte county reports making purchases of beef cattle in Shasta and northeastern Tehama county as low as \$35 a head to be carried through the balance of the winter on rice straw, bran, and polish. He states that many cattle in that section are too thin to stand the trip out of the mountains on account of the shortage of feed which he describes as acute.

Because practically all of the Thompson Seedless and Sultana raisins have already been sold by the Associated Raisin Co. they will pay \$1,200,000 to growers of those varieties on last year's crop this month. This makes the total amount paid per ton to date 1120, which amount will be increased by a further payment later in the year.

California lumbermen cut two hundred fifty million feet more of lumber in 1916 than in 1915, according to District Forester Coert DuBois. To date forty-five mills, each cutting ten million or more per year, have reported an output of 1,234,000,000 feet. The cut of forty-three of these mills was 1,221,742,000 in 1916, while in 1915 the same mills cut 976,410,000 feet.

MISCELLANEOUS.

GROCERIES WHOLESALE—Our prices are the Lowest and our quality the Highest. Dollars saved on every order. Freight paid within 100 miles. Send for catalog. Fresno and Company. Mail Order Grocers, 1264 Divisadero street, San Francisco.

SECOND HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. Spector Pipe Works, 306-8 Howard St., San Francisco.

EVERY SIZE BROUGHT IRON WATER Pipe and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a Square Deal. Weissbaum Pipe Works 160 Eleventh St., San Francisco.

WANTED—Second-hand Feed Cutter for filling silo. Also engine, pump and surface irrigating pipe. A. H. McHuron, 149 New Montgomery St., San Francisco.

AT LAST THE PERFECT SILO—The Star Round: No hoops. No bolts. No experiments. Any one can erect. Close price. Address D. O. Lively, 215 Hobart Bldg., San Francisco.

FOR SALE—One Johnson Tractor in running order. Good orchard engine. Correspond with Rancho De La Higuera, Yountville, Napa Co., and get particulars.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

ASK FOR SNOW'S GRAFTING WAX—In use all over the State. If your grocer does not keep it, send to D. A. Snow. E. D. Box 548, San Jose, Cal.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumers Catalog. Smiths' Cash Store, 108 Clay St. San Francisco.

FOR SALE CHEAP—A 2-unit Sharples Mechanical Milk in good condition. Mrs. Lena D. Snyder, Thermal, Cal.

JOE MILLER'S WHOLE WHEAT BREAKFAST FOOD. Miller Milling Co., Alpaugh, Cal.

SEEDS, PLANTS AND TREES.

FREE 1917 PLANTING GUIDE and "Pure Seed Book" 96 pages handsomely illustrated in many colors. Describes latest, best varieties vegetables, flowers, field crops, fruits, shrubbery, etc. A dictionary on gardening! Flower lover's delight! Field crop guide! An orchardist's manual! Berry-grower's book! A postal gets it. Don't buy seeds until you read it. Galloway Bros. & Co., Pure Seed Specialists, Waterloo, Iowa.

WHOLESALE PRICES TO PLANTERS—Plums, Prunes and Apricots on Myrobalan, 15c; Cherries, 15c; Peaches, 10c; Nectarines, 12½c; Almonds 15c. All 4 to 6-foot trees. Grafted Walnuts, 25c up. Grafted Pecans and full line of other stock. New surplus list ready. All stock guaranteed. Tribble Nurseries, Lodi, Cal.

ALFALFA SEED—Common variety and Smooth Peruvian, good quality, excellent color, high germination test, grown in Arizona under ideal conditions. Do not buy until you have compared my samples and prices with seed others offer. E. F. Sanguinetti, Yuma, Arizona.

HAIKY PERUVIAN ALFALFA SEED—We have less than one ton of Haiy Peruvian left. Very high grade and no dodger. Send your order at once at 32c. We have the best common alfalfa seed on the market at a very low price. Bomberger Seed Co., Modesto, Cal.

CITRUS TREES—all leading varieties. Large line Lisbon and Villa Franca Lemon, and Washington Navel Orange Trees. First-class stock and clean. Special prices to dealers or to growers in carload lots. Randall Brothers' Nurseries, Whittier, Cal.

ALFALFA SEED—There is a difference in the varieties and strains of alfalfa seed. Send your address for sample and our low price, and we will tell you just how our seed is selected—and why. Bomberger Seed Co., Modesto, Cal.

STRICTLY FANCY SEEDS—Alfalfa, Scarified Sweet Clover, Red Clover, Timothy, Rye Grass, etc. Free Bulletin—"Sweet Clover in the Northwest." Write for samples and prices. Ralph Waldo Elden, Central Point, Oregon.

WALNUT GRAFTING WOOD—Genuine Franquette. Same strain as Vrooman orchard was planted from. Willson's Wonder, grown by originator, F. C. Willson, Encinal Nurseries, Sunnyvale, Santa Clara Co., Cal.

FOR SALE—I have about 100 sacks of Oregon American Wonder Seed Potatoes. Good stock. H. A. Hyde, Watsonville, Cal.

QUALITY TREES—Seedlings, 5c. Prunes, 10c. Walnuts, 30c. Cash Nurseries & Seed Store, Sebastopol, Cal.

FOR SALE—Walnut Trees. Magnolia Nurseries, Whittier, Cal.

WANTED.

DAIRMEN WANTED—About April 1st, a married man, who is a good milker and who has some help, to rent dairy of about 30 good cows, do the milking, feeding, put up the hay, fill silos and do all work connected with dairy, for a share of income. Good recommendations required. Give all particulars first letter. Address P. O. Box 31, Separto, Yolo Co., Cal.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A." Western Normal, 524 E. Market St., Stockton, Cal.

WANTED TO HEAR from owner of good ranch for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

COUNTRY LANDS.

FOR SALE—948-acre stock ranch in Napa county. Price, \$17,000 net. All modern improvements. Living creek. 125 acres hay, grain and alfalfa land. Free range adjoining. 175 head of cattle can be purchased if desired. Liberal terms. Owner, Box 363, Napa, Cal.

WANTED TO RENT—Alfalfa ranch. Dairyman with small herd registered Holsteins wants to rent 40 acres of good alfalfa. Don't answer unless you have a good stand and good water. References furnished. Address, Box 470, Pacific Rural Press.

\$5,450.00—Andrew Linquest, 20-acre Peaches and Grapes ranch, two miles west Kingsburg, California. Improvements. Half interest. Pumping plant. See Linquest, C. E. Robertson, 105 Montgomery St., S. F.

30 ACRES irrigated bean, potato and onion land in Sacramento Valley for rent on shares to farmer with teams and implements. B. E. Priem, 529 Phelan Bldg., San Francisco.

B. S. COELHO, CORCORAN, CAL., Owner.—150 acres improved, subdivided alfalfa dairy, Stratford. Keeps 85 cows. C. E. Robertson, 105 Montgomery St., San Francisco.

FOR SALE CHEAP—320 acres good level land in Klamath County, Oregon. For information, address owner, W. H. Johnson, 22 Maple Ave., Watsonville, Cal.

FOR SALE, RENT, OR LEASE on reasonable terms. Creamery in good dairying section for summer business. For particulars, apply Box 64, Quincy, Cal.

SALE OR RENT—Paying apple orchard. Crop or cash rent to right person. Sale easy terms. H. C. Rawlins, Willows, Cal.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

640-ACRE MONTANA HOMESTEADS—New law. Circular free. Bureau 27 Boulder, Montana.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

EXPLOSIVES AND FARM INSURANCE.

[Written for Pacific Rural Press by A. J. Pillsbury, Chairman Industrial Accident Commission.]

In my recent communication to you regarding insurance rates for farm products I did not go into the matter of the use of explosives through fear that it would make the communication too long.

If the blasting is in connection with the breaking up of subsoil and other incidental work, the employer is required to keep a separate record of the payroll of all persons engaged in the storage, handling or use of explosives, including loading, capping, connecting, and firing, and the insurance rate for that kind of work is \$21.82 per hundred dollars of payroll. If the blasting payroll is larger than the general payroll a minimum premium of \$25 is charged. It is obvious, of course, that, while the rate is extremely high, the time spent in such work is generally short and the payroll not large, so that the insurance does not ordinarily run into a very large sum, but the risk is very great and comes mainly from two sources:

1. That the person handling the explosives is not thoroughly trained in their use, and

2. That such persons have become so thoroughly used to handling explosives that they cease to fear them and become careless.

Whenever a handler of dynamite gets so that he is not afraid of it it is time to set him to herding hogs or pitching hay and to keep him entirely away from dynamite until he gets to be afraid of it. Strange as it may seem, the history of the use of such explosives is characterized, not infrequently, with the habit of lighting matches and smoking cigarettes while handling dynamite caps and of fixing fuses with a box of dynamite within easy reach. In such cases they sometimes find enough of the remains of the farm worker to justify a funeral.

Less Expensive for Stump Clearing.—When explosives are used in connection with the clearing of land for agricultural purposes and not in connection with the operation of a farm, the rate for such clearing of land, including removing of stumps, is \$3.63 per hundred dollars of payroll and no separate record of the blasting payroll is required, such hazard being included in the average rate of \$3.63 for all persons engaged in the work and thereby in any degree subjected to the hazard. The minimum premium, however, for clearing land is \$10.00, but this minimum premium is not charged if the work is done in connection with clearing a part of a farm in operation and where such operation is covered by insurance and the payroll for the farm operation is the controlling payroll, that is, is greater than the payroll for the clearing of land.

It will hardly be necessary to add that, where blasting operations are carried on for breaking such soil, all workers except those actually

engaged in handling the powder should be far away from the scene of the blasting. I call to mind one case where stumps were being blown out and one ranch hand was watching the operation at a distance of a hundred yards or more and yet was killed by a flying portion of the stump. There have been many cases where rocks have been thrown with fatal effect several hundred feet from the scene of the explosion.

There are few instances where the Safety First rule is more necessary of application than in using dynamite as an implement in farming; and it is a task to which no inveterate cigarette smoker should be put lest he forget where he is and what he is doing and automatically proceed to light a cigarette with his hands full of dynamite caps. So likely is such a thing to happen that I know of an instance where a man whose entire occupation is connected with a powder plant found himself complacently smoking a cigarette with a double handful of caps in his possession. Although nothing happened, he has not gotten over being frightened over the incident to this day.

PUMP SUPPLIES LATE ORCHARD IRRIGATION.

[Written for Pacific Rural Press.]

Many orchards suffer for lack of water late in the season when the crops are off and the leaves seem deadened and dormant, says C. H. Schmidt of Fresno county. That is just the time they need water, especially on light soils like Mr. Schmidt's, being careful of course not to encourage growth so late that it will be frozen back.

But late in the season is when many irrigation systems fail. It was to forestall such failure that Mr. Schmidt put in a pump when he planted his peach orchard in 1908. Not always does he need it; for ditch water is usually plentiful; but he does not take any chance of exhaustion and death of the trees late in the fall, nor does he fail to get plenty of strong fruit wood for next year's crop.

The pump is a little one run by a 5 h.p. electric motor and throwing 300 gallons per minute; but with it he irrigates an acre in ten or twelve hours. He insists on the water reaching the lower root strata.

The last irrigation comes in October after the Phillips are off. The Tuscan are watered as soon as they have been picked. If the trees were not vigorous, says Mr. Schmidt, they might start new growth under such late irrigation without being able to finish it before winter. With the heavy manuring and alfalfa cover crop in his orchard, however, the trees start new leafage all over, which is supplied with necessary food by root and leaf action without exhausting the tree in any way. Of course such additional food must be furnished or the new growth will do nothing but exhaust the tree of its stored-up food. With Mr. Schmidt, this new growth matures satisfactorily and he considers the fall irrigation absolutely necessary.

Economical Pumping

—Can only be accomplished by the use of efficient Pumping Equipment.

Alpha Distillate Engine.

AN EFFICIENT ENGINE is one that will not only continue to develop the full amount of power required on the smallest consumption of fuel, but will also require practically no attention during operation. It must be free from repair expense and the possibility of a breakdown during the pumping season.

Alpha Distillate Engines and Viking Rotary Pumps

Make Efficient, Reliable Pumping Plants

All Alpha Engines are equipped with a high-class, built-in, gear-driven magneto; they start on the magneto without cranks, and the use of batteries and coils is entirely eliminated. Built in all sizes from 1 1/4 to 100 H. P.

VIKING ROTARY PUMPS

—an ideal irrigation pump

VIKING PUMPS will deliver more water per minute for the same amount of power used than any other type. Its very high efficiency is due to its positive delivery, its simple design and careful manufacture. It is SELF PRIMING, requiring no foot valve or priming pump and easy to install. Investigate the Viking Pump.

Built in all capacities from 20 to 1600 gallons per minute.

Viking Rotary Pump.

Send for complete catalog of both Alpha Engines and Viking Rotary Pumps. They are yours for the asking. Now is the time to consider pumping equipment.

How Old was The Old Oaken Bucket?

THE "iron-bound" bucket that hung in the well was covered with moss but the hoops were always tight and the bale was always secure. Time left its impress on the wood and on the metal but rust did not eat through the iron although the bucket was subjected to the severest of exposures. The iron was pure iron and pure iron resists rust.

"ARMCO" IRON CORRUGATED CULVERTS

By chemical analysis these are purer iron than were the hoops of the old oaken bucket. Under similar conditions "Armco" Iron should outlast even the old-fashioned iron. Under highways and railroads all over the country, "Armco" Iron Culverts give service like that of the old oaken bucket. They are the only metal culverts that can be counted on to outlast the generation that installs them.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing, and Formed Products, write the manufacturer in your vicinity, or

PITLESS PUMP FOR 20 ACRES.

To the Editor: I wish to put up a pump and the question with me now arises if a pitless pump would be just as good and cheap as a centrifugal pump. It is 20 or 22 feet to the water and the well is about 100 feet deep. What size of pump would it require to irrigate 20 acres of land, and what size of engine would it take to run it? Would it cost more power and money to run a pitless pump?—H. K., Bakersfield.

[Answered by S. H. Beckett, University Farm, Davis.]

The size pump necessary to irrigate 20 acres depends mainly on the crop to be irrigated. If alfalfa is to be seeded, a pump with a discharge of not less than 400 gallons per minute and preferably 700 gallons per minute is desirable. This would call for a 4 or 5 inch pump. If on the other hand an orchard crop is to be irrigated, a 3 or 4 inch centrifugal could be used.

Under the conditions stated, the type of pump to be used is going to depend on the "pull-down" or lowering of the water level in the well while the pump is in operation. The deep well turbine or pitless pump is best adapted where the lift is in excess of 50 feet. For lifts of less than 50 feet the centrifugal type is preferable. On a 40 per cent efficiency basis a 3-inch centrifugal pump will require 0.14 h.p. per foot of lift of water, a 4-inch centrifugal at 4.5 per cent efficiency requires 0.22 h.p. per foot lift, and a 5-inch on a 50 per cent basis requires 0.34 h.p. per foot lift.

I would advise your correspondent to secure University of Cal. circular 117 on the Selection and Cost of a Small Pumping Plant. This may be obtained by applying to the College

of Agriculture, University of California, Berkeley.

POWER NOTES.

The Farmers' Automobile Detective Ass'n has replaced an anti-horse-thief association in Indiana.

The California Automobile Association has eight automobiles mapping and signing roads and securing information for its Touring Bureau.

Join the California State Automobile Ass'n and help their work of making roads more tourable and less terrible. Dues are only \$6 a year with \$2 initiation fee.

A pressure gauge and safety valve permanently fixed in the automobile tire valve, is now on the market. It registers the pressure at all times and releases air if the tire is pumped too hard or becomes too hard due to expansion of the air.

A tail light is being made now which turns up a big red sign "Slow" whenever the brake is applied. This is to avoid read-end collisions. People who slow up without using the brake are seldom endangered.

The Riverside Portland Cement Co. have sold the horses and hay on their 100-acre lemon orchard near Whittier and are putting in tractors.

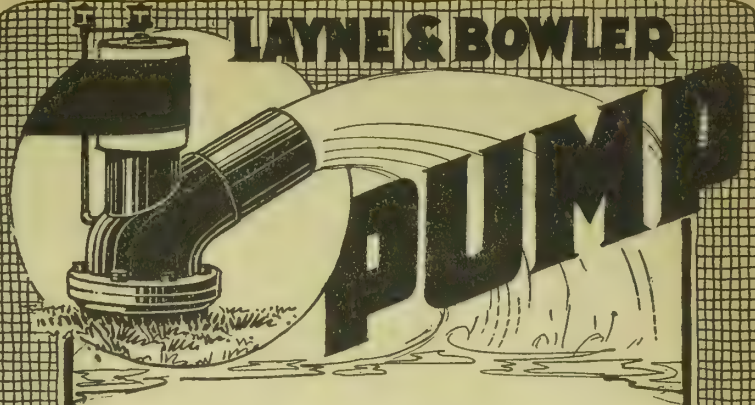

No more Avery orchard tractors will be available for California for some time, according to advices recently received by C. S. Anthony, the Avery distributor for the State. A carload was recently shipped; but the output of the factory, which is in Illinois, will be used locally as fast as made.

The Gillette Ranch of Lindsay has two new tractors in addition to the two already used on their 280 acres of citrus and olive orchard. Fast work is required to get the ground in good condition before it shall have dried too much to work at all.

AUTOMOBILE NOTES.

After the puncture in the inner tube has been repaired the tube should be rubbed with soapstone and allowed to lie for some time in a cool place.

In cities, never stop your machine unless you are headed to the right of the street. Never pass other cars at the intersection of streets in the business district. Wait your turn.

LAYNE & BOWLER

PUMP

The severe duty of Western irrigation service requires a pump designed to operate at low cost without danger of a breakdown or trouble. Its construction must be extremely simple and of such a character as to meet widely varying conditions. Layne & Bowler Pumps meet these requirements perfectly. Over 5000 in actual operation testify to this. Let the World's largest water developers solve your pumping problems. Our interesting catalog No. 25, on irrigation and pumps is yours for the asking. Write for it.

Desirability of Larger-Sized Dairy Cows.

Does the future welfare of the Jersey lay in the direction of larger-framed and more rugged cows, or will it remain with the delicately built small cow that has come largely as a result of intensive Jersey Isle breeding?

While there are advocates of both types it is a significant fact that the majority of experienced grade dairymen, at least in California, are demanding the more rugged animal and the greater number of our prominent breeders seem to be working toward that end also.

That a larger Jersey may be developed in this State than we have been accustomed to in the past is quite generally admitted, but there is some confusion as to how best to secure the additional size.

Although he has bred purebreds because of the increased revenue they produced in butterfat, as well as because of the satisfaction in owning good stock, T. B. Roy of Marin county has demonstrated a feasible plan of increasing the size of Jersey cattle that may well be considered by those interested along this line.

It is now over 30 years since Mr. Roy secured his first purebred Jerseys and during all of that time it has been a hobby with him to breed and keep large cows.

The practical working out of this hobby has been hinged on two controlling factors: good feed and development of heifers before breeding. Of course he has used discretion in selecting herd sires, demanding at all times big, rugged fellows with tested dams back of them. Some of these have not been as prepotent as he would have liked them to be, but on the whole they transmitted their size to the offspring.

Size without production, though, has never been considered proper by Mr. Roy, and through the use of the scales and the Babcock tester he has intelligently selected the heifers from the best cows for his own herd, disposing of the poorer ones regardless of the price they would bring.

Situated as he is on a hill ranch,

with spring pasture and grain hay as the main feed supply, a good deal of mill feeds are purchased, as well as some alfalfa hay, for a butter trade of long standing is enjoyed that requires a year-round supply.

After selecting the heifers that are to be retained they are carried along on good feed, with the idea that lack of feed will retard development of any animal. A rough board shelter also protects the entire herd from the cold and wet winter weather, which is another aid in development.

Breeding is usually practiced so that the heifer will come in with her first calf right around three years of age, and this, in Mr. Roy's mind, is the most important consideration in larger framed cows.

It sometimes happens that a heifer gets bred sooner than she should, and always they are around 200 pounds lighter than those bred later. The writer was shown several such heifers alongside of others which had been bred later, and the difference was sufficient to convince anyone of the correctness of Mr. Roy's theory.

While it is true that these smaller cows oftentimes produce as heavily as the larger cows in the herd, care is exercised against selecting heifers from those cows, as that would tend to reduce rather than increase the average size of the herd.

The exact weight of Mr. Roy's cows is not known, but as a whole there is an appreciable difference between them and the ordinary Jersey in the State. While one can only theorize as to the size that would have been attained had this herd been developed on an alfalfa ranch instead of on hill land, it is logical to suppose that the size would have been materially increased, because of the more plentiful supply of good feed.

The Farmers' Protective League has recently launched a campaign for more members in Southern California by holding a meeting in Los Angeles. C. C. Teague was appointed chairman of the organization.

Fancher Farm Maxie 186,369

Breaks World's Record

Fancher Farm Maxie—a four-year-old heifer, owned by Senator A. T. Fancher of Salamanca, New York, recently broke the world's four-year-old record, producing 46.84 pounds of butter in seven days.

This places her in second place among the world's dairy cows of all breeds and ages.

During the test period and at all other times since she first calved, she has been milked by

102 "Indiana" Service Stations in the West!

"Our duty to a customer does not end with our delivering to him a silo that is all we represented it to be; we must also assist him in learning to use it so as to get the best possible results."

Chas. K. Spaulding Pres.

THIS statement, from the man who outlines the policies of this company, explains why we strive so hard to make Indiana Silo Service equal Indiana Silo Quality! It also explains why Indiana Silo owners get such splendid results from the very first. They do not have to experiment.

Every silo representative we have in the field is a "service station," so to speak. Their mission is to give information and assistance, as well as to sell silos. Each man is also an "information-gathering" station, from which source we gather much of the experience, etc., set forth every month in our Silo Service Bulletin—"The Watch Tower of Prosperity." This data, carefully edited by our own agriculturist, will save thousands of dollars annually to users of the

INDIANA SILO

In the minds of thousands of men who read this, there is no doubt as to the superiority of Indiana Silo construction. Designed by the world's largest silo company, and tried out in actual use for over fourteen years, its clean, efficient record has been established on **OVER 60,000 AMERICAN FARMS**. Add to this our **ABSOLUTE GUARANTEE**, and we are sure you must realize your money is much safer invested in an Indiana Silo—known and sold in every state in the Union—than invested in any one of the unproven types to be found in every locality.

Indiana Silo prices have not advanced as yet, for we protected your interests as well as ours by contracting for a number of cars of steel early last Fall. Our business so far this year is breaking all records, and we may be forced to advance our prices, just as prices on your farm products have advanced. So our advice is—**ORDER YOUR SILO EARLY!**

Monthly Silo Bulletin FREE

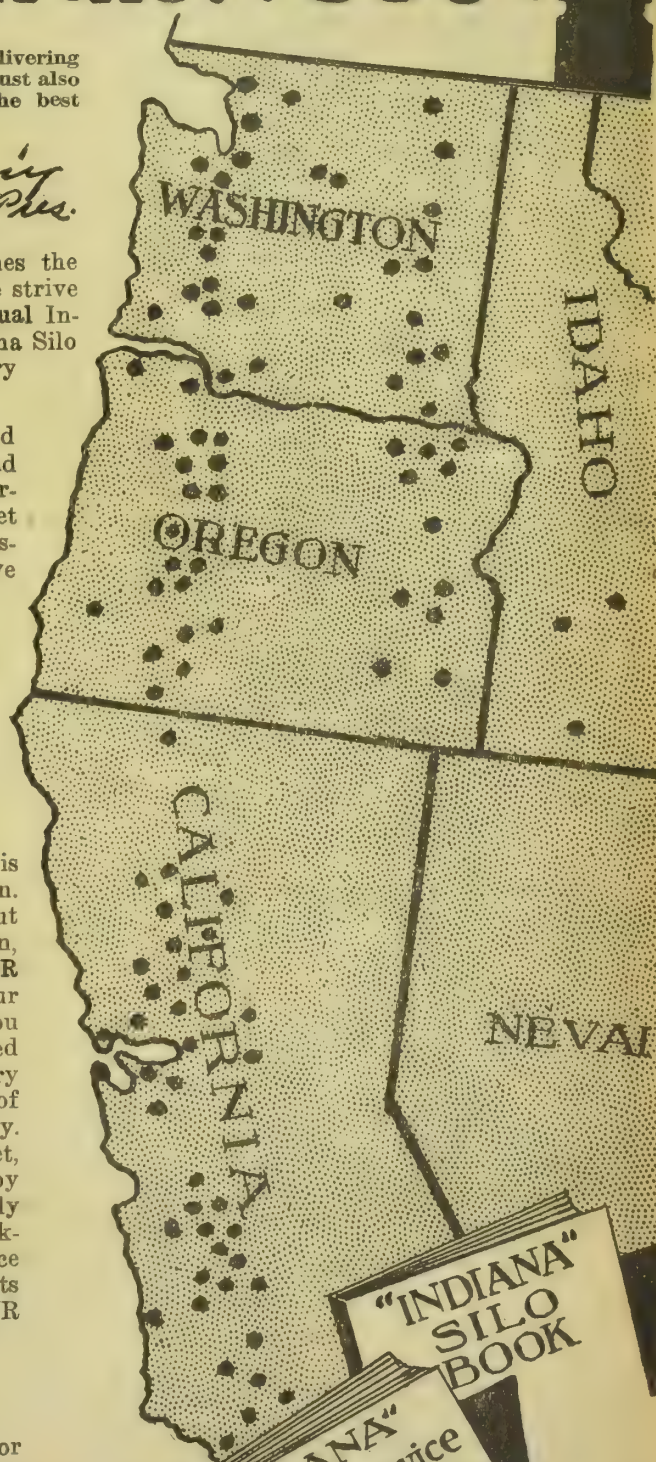

Whether you have an Indiana Silo now or not—regardless of what silo you are interested in, we will be glad to send you this silo bulletin each month. We'll also mail our complete free Silo book. Fill out the coupon, or send a postal. Address all inquiries to our Salem office.

Objections to Hide and Brand Law.

[Written for Pacific Rural Press by F. L. Gordon, Suisun.]

This bill is being advocated by, and is plainly in the interests of, very wealthy cattlemen who wish to be protected from theft and are not willing to make the effort and bear the expense as others in all lines of business are required to do. Instead of asking the aid they are entitled to from the county authorities, they see an easier way by shifting the whole responsibility on the very generous State of California. The legislation they propose is very annoying to small cattle men and more particularly so to the thousands of farmers that are not cattlemen but keep five to twenty-five or fifty head of cattle who run them in small, well-fenced fields and are very able and willing to protect them from thieves.

Annoying Details.—These thousands of farmers and small cattlemen will be compelled to brand and ear mark all their cattle (that are not actually used as milch cows or are registered stock) at the time of weaning from their mothers, with a

registered brand and a registered ear mark and pay 50c and \$1.00 according to the size of their herds, for registering such brand and ear mark, and pay such fee yearly for renewal. They will not be allowed to kill and offer for sale any of their calves they wish to dispose of for veal or any other of their cattle without first getting a license for conducting a slaughter house at the yearly expense of \$6.00 and they must notify their district inspector when they will kill any of their own cattle and he must come and inspect ear marks and brands, etc., before they can kill; and then said inspector must charge them a jitney for tagging the hide. They will not be allowed to sell and deliver any of their cattle without first notifying the inspector and he must come and inspect ear marks and brands and charge another jitney per head for such inspection. They must also give a bill of sale for any cattle sold, describing the cattle in detail, and said bill of sale must be acknowledged before some officer authorized to acknowledge signatures, and said acknowledgment must be paid for, of course. They will not be allowed to skin a dead cow and sell the hide until the inspector inspects the hide nor can they allow another party, even be he their own son, to handle and gather their cattle without a written permit to do so. I contend that all these regulations are radical in the extreme, a decided inconvenience, annoyance, and expense to the small cattlemen and thousands of farmers keeping a few cattle. Where it will benefit one, it is a hindrance and annoyance to a hundred; and those that will be benefited by senate bill 159 are very well able to take care of their cattle at their own expense with the aid of their county government.

[A copy of the bill is on file in our office for convenience of anyone desiring to study it.—Eds.]

HOG PROFITS AND FEED PRICES.

To the Editor, I would like to know whether it is more profitable to sell hogs at 9 cents with feed at present prices or at 6 cents with feed a little more than half as high.—W. P. A., Modesto.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

You do not state what feeds you are using for pork production at the present time, nor what they are costing you. With barley at \$2.50 per 100 lbs. it is doubtful if you can make a profit on hogs at 9c no matter how you figure it or how well you feed. It might be done, but the chances are very slim.

With feeds half their present price your chances of coming out even with hogs at 6c would be better than with feeds twice that high and hogs at 9c. If the price of hogs was in proportion to the price of grain, then you would ordinarily figure that there was a greater profit when both hogs and grain were high. This is due to the fact that the selling price is what you get for the gain that you put on. If in each case the gains cost you within 1c a pound of the market price you receive for them, there would be no difference in profit.

SILAGE FOR HOGS.

[Written for Pacific Rural Press.]

G. R. Cloes of San Diego county was feeding silage to hogs; but after quite a thorough test was not satisfied with it. Both milo and Indian corn had been fed. The milo was dry and pithy when siloed, the leaves all dead and the grain plump and plenty. Water from a ¾-inch hose, under medium pressure, had been run in with the chopped milo. Be-

cause it has such a large proportion of grain to stalk, Mr. Cloes says that if he ever feeds silage to hogs again it will be milo, for the stalks are wasted.

So it was with Indian corn, which was being very largely wasted except the grain, although it was fed on a clean wooden floor. Mixing ground barley with it seemed no more effective in getting the stalks cleaned up, which were still ignored by the hogs and left as litter.

Brood Sows Handled Conveniently.

[Written for Pacific Rural Press.]

Convenient farrowing pens at low cost can be seen on the Paulin and Wilson Duroc-Jersey ranch near Imperial, where about 1000 head are usually kept. There are 44 pens on two sides of a lane through which feed can be hauled and distributed into troughs and onto feeding floors along the lane. Each pen is 8 feet wide and extends 19 feet back from the lane. The floor extends back 10 feet, and the rest is sheltered under a galvanized iron roof whose lower edge is six feet above ground.

"High roofs are essential here to catch wind and get air circulation," say the young men. But the outer side of the pens is boarded up solid about 3½ feet to keep the sleeping hogs and pigs out of drafts, especially in winter. Partitions between sleeping quarters are also solid to

prevent wind sweeping lengthwise through the shed where it would blow on the animals.

Alternate partitions are removable, so the space for each group of sows and pigs can be doubled at will. The fixed division fences each have a water-trough set centerly underneath so it serves the pens on both sides even when the pens are doubled.

Having boarded floors, convenient to the alley or to the rear end of the shed, it is so easy to clean the pens that this work is done two or three times a week.

A dipping vat fixed in the lane is accessible to all pigs without much driving. An effort is made to dip them by hand at 1½ weeks old, and to drive them all through the tank at about three weeks.

Chopping Coarse-Stemmed Hay.

When the dairyman is compelled to pay as much as \$22 a ton for alfalfa hay as has been the case the past season, it stands him in hand to waste as little feed as possible.

In the dairy sections of Marin and Sonoma counties more alfalfa hay has been purchased this year than ever before in the history of those districts, and, as might be expected where baled hay was purchased, much of it was of a very poor quality—so bad, in fact, at times that there was little to it except stems. On the LeBarron Estate Com-

pany's ranch near Valley Ford there is very little loss from this coarse hay owing to the fact that they have a feed cutter in the barn through which all such hay is run before being fed.

The practice on that dairy is to feed all good hay just as it comes from the bale, but all bales containing hay from which the leaves fall off badly when the wires are loosened are run through the cutter. The expense is very small and there is practically no loss of coarse stems in the feeding troughs or mangers.

PREMIUM HOG PRICES.

[Written for Pacific Rural Press.]

Two cars of hogs were sold in mid-January by Geo. W. Paulin and Geo. H. Wilson of Imperial at 40 cents above the prevailing prices. They averaged 196 pounds and one carload was solid red and of uniform size and finish. The other car was spotted in color but uniform otherwise. Since Paulin and Wilson depend on local buyers to take their small lots, they give the local buyers a chance on the carlots, by inviting several to come to the ranch and bid on them.

COW-TESTING DAIRYMEN SELL COWS.

[Written for Pacific Rural Press.]

Probably the best argument why the majority of our dairymen should either aid in organizing a cow-testing association or join the one already operating in their district is the large percentage of association cows that are disposed of by their owners.

In talking with the secretary of an association recently he remarked that his chief trouble was to keep the number of cows up to requirements because of the heavy culling that had been done by members after they tested awhile. He told of one dairyman who had just sold 14 cows from his herd because the scales and tester had shown them to be costing more than they produced. It is interesting to know that he had only been testing five months.

It is further interesting to know that this same association had to suspend operations for a time last

year because of the heavy chopping of boarders by members as a result of the figures furnished them by the association tester.

If, as is generally contended, the man who tests his cows is more pro-

gressive and therefore more likely to have heavy-producing cows than his neighbor, it would be doubly interesting to know how many cows are costing more than their keep in non-members' herds.

Do not overwork the team during the first week of spring and thereby impair their efficiency during the rest of the season.

Bad-Tempered and Why?

Cows are sensitive animals and form habits easily. Many a good cow has become 'mean' through some irritating udder sore left to heal itself. Save the cows' disposition and serious danger by using Bag Balm, the great healing ointment, at the first sign of caked bag, inflammation, chafing, sore, chapped or injured teats. A great antiseptic healer for any scratch, bruise or cut.

Sold in generous 50c packages by feed dealers and druggists. Write for useful free booklet, "DAIRY WRINKLES."

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

T. B. Purvine reports the sale of registered Jersey bulls to the following dairymen: Walter Foster and Albert Martin of Sonoma county and James Fallon of Glenn county.

Over 300 dairy cattle have recently been entered in the Gridley Cow Testing Ass'n from the river district north of Chico. This brings the membership in the association up to the required quota.

The World's Grand Champion cow of all breeds, the Ayrshire Kilnford Bell 3rd, owned in Wisconsin, has just died, according to J. G. Watson of the Ayrshire Breeders' Ass'n, Brandon, Vt.

Stockton is getting some undesirable notoriety due to certain unclean dairies. State Dairy Inspector J. H. Severin is taking measures to have them cleaned up in a practicable way as shown by certain other dairies in the vicinity.

A. R. Magruder of the Gotshall Cattle Loan Co., Ripon, advises us of the sale of eight high grade Holstein cows and the registered bull, King Lunde Blacken De Kol to G. Haubruck of Thalheim. The bull was sired by a grandson of King of the Pontiacs.

F. L. Morris of Woodland reports that Aaggie Acme of Riverside is making the highest butter records ever made in California. She is on official test. In the 100 days preceding Feb. 27 she produced 8015 pounds milk containing fat to make 444.36 pounds butter.

The Holstein cow Wandermeere Belle Hengerveld has produced 32,465 pounds fat in seven days, having freshened at 4½ years. She is owned in Michigan; and is the 18th Holstein to exceed 32 pounds fat. This makes her butter equivalent to over 40 pounds in a week.

The Gridley Cow Testing Ass'n contains seven grade cows and one purebred which produced over 50 pounds butterfat in February, 1917. Sixteen cows produced over 45 pounds. H. E. Wickman's grade Holstein produced 78.1 pounds fat from 4.3 per cent milk. Five of the highest eight cows belong to J. H. Guill. George Clark, Tester.

The Solano-Yolo-Colusa Cow Testing Ass'n contains 14 cows which produced 50 pounds or more of butterfat in February. D. Beeman's Holstein produced 75.51 pounds. He had the highest record for a herd of less than 20 cows, his five Holsteins averaging 1.69 pounds. P. Gillian had the highest herd average for over 20 cows with 1.08 pounds daily. J. A. Weldon, Tester.

SWINE.

Hogs sold at \$14 to \$14.25 in Chicago Mar. 5.

Hogs are reported bringing pro-

ducers 12 cents at El Centro.

H. P. Eakle of Yolo is sparing no expense to build up a fine herd of Durocs.

Dr. J. B. Cady commends Kings county's improvement in conditions affecting swine cholera control.

About 150 hogs were sold around Meridian, Sutter county, for 10½ cents to go to Portland recently.

Porterville hog growers have marketed the past week 2500 hogs valued at over \$55,000, the prevailing price being \$11.00 per cwt.

A couple of Solano county feeders are buying hogs from the farmers and putting them to a hog-cafeteria containing Indian corn and milo.

A thousand hogs valued at \$18,000 to producers were shipped from Visalia Mar. 1 to Los Angeles. Shipments from Visalia have amounted to over \$5,000 per week for the past four months, according to buyers.

The Henderson Co. of Sacramento have recently sold 190 of their purebred Chester White and Duroc Jersey hogs to H. C. Guigg and T. R. Cooper. This reduces the size of the Henderson herds to about 10 of their choicest brood sows.

F. M. Johnson of Napa has recently bought a sow from Ohio. She is a daughter of the International grand champion Joe Orion 2nd. He has also bought a Cherry Chief sow bred to Critic D, which had more winners at Omaha than any other boar. Two other recent purchases are a daughter of Burke's Good Enough bred by Economy Stock Farm and a gilt from a University of California granddaughter of Col. Protection.

The Glenn County Farm Bureau, through its market agent, O. L. Leachman of Orland, shipped its first carload of hogs to San Francisco this week and has several other carloads of hogs and cattle to ship at once. They were a heterogeneous bunch of many sizes, ages, and colors. Farm Adviser W. H. Heileman says there has been a bigger increase in membership since this feature was started than ever before.

BEEF CATTLE, SHEEP, HORSES, ETC.

First cutting alfalfa hay has been contracted at \$12 a ton baled and on board car in the Los Molinos district.

Ruby and Bowers, extensive horse breeders and dealers, propose to handle purebred Herefords and Holsteins.

A trainload of cattle was recently received at Chualar from Nevada and 300 head are coming from Oregon to King City.

Wheat hay has found a ready sale at \$16 on board car at Tehama the past month; but supplies are about exhausted.

D. E. Richards, manager of the O. A. C. livestock farm, has been appointed secretary of the Oregon Station Registration Board.

That J. W. Yocum of Calipatria has sold his wool clip, yet to be cut, at 33c per pound is a good sign for sheepmen. This is said to be nearly twice as high as last year.

Prices of cattle and calves in the Coast counties hit bottom just before the rain, and bounced quickly as the spring pastures were assured. Buyers are having trouble to fill orders.

R. D. Mayes and A. J. Hillhouse of Dixon report their sheep in Nevada in fine condition. They expect \$40,000 worth of lambs; and their wool is contracted at 30 cents per pound.

Benj. Quigley of Linne, San Luis Obispo county, is looking for purebred Herefords to replace the 100 grade cows and heifers he expects to sell soon at auction in Paso Robles.

Consular advices from New Zealand dated in January showed fat wethers selling \$5.50 to \$10 per

head; lambs \$5 to \$7.40; fat steers \$73 to \$100; with all prices on the increase.

A large number of brood mares and youngsters purchased by Louis Titus at the Woodland Stock Farm dispersal, have been sent to New York and will be sold at the mid-winter auction next week.

The public sale of registered Shorthorn cattle to be held at Mayfield May 2, 1917, from the Carruthers Farms herd ought to interest every lover of the red-white and roan. The twenty mature cows have all been in California 2 years and are perfectly climatized to California and Coast conditions. Every one will either have a calf at foot or will be well along in calf to guarantee them breeders. The twenty head of yearling bulls and heifers are California bred, a large per cent of them having been bred and raised at Carruthers Farms. The eight two-year-old bulls are of the richest Scotch breeding. They have been in California a year and are climatized and are ready for hard service.

POLAND CHINA MEN FROM STATE ASSOCIATION.

At a big get-together banquet Tuesday night at Hanford, just preceding the auction sale, Poland-China men from all over the State organized a State-wide association for the purpose of systematically boosting the breed as well as to assist in the development of the swine industry in the State. Feeling as they do, that the Poland-China hog is particularly adapted to meet the conditions existing in the State, these men propose to proceed to advertise this fact to the end that there shall be an ever-increasing demand for the "truly American hog."

The following officers were elected, and the first meeting is called for the Farmers' week at Davis, in May: President, Wm. Bernstein, Hanford; Vice-President, O. L. Linn, Modesto; Secretary-Treasurer, R. H. Whitten, Los Angeles. Directors: Nate Hauck, Alton; C. R. Hanna, Riverside; H. J. Marsh, Modesto; M. Basset, Hanford.

HIGH-PRICED HOG SALE.

One of the most successful auctions that have ever been conducted in Imperial Valley was that of J. Frank Walters of Brawley, Feb. 26. D. L. Zinn proved himself some auctioneer, and Chas. Johnson an able ring manager.

The herd boar, Col. Crimson, sired by King the Col. and out of Crimson Lady II, was taken for \$165 by Paulin and Wilson of Imperial. The brood-sow, Ed's Model, and her litter of five was sold to R. N. Miller of Brawley for \$175. She was sired by Taxpayer. Ten gilts by Pathfinder averaged \$59 per head. One gilt by Illustrator topped the gilt sale at \$112.50.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene B. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St. San Francisco.

ATTENTION, STOCK MEN! Population increasing, meat decreasing. Greatest rush in years for Government and State land. Free homes. Safe investments without residence. School, State, Indian, Government lands. Now available. You have nine rights now worth \$1,000 each. Booklet and 640 acre Homestead Circular Free. Write Joseph Clark, Sacramento.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on
Blatchford's Calf Meal than on all
other milk substitutes combined.

100 lbs. makes 100 gallons of milk substi-
tute, costing only one-third as much as milk.
Prevents scouring and insures the early
maturity of sleek, handsome calves.

It is steam-cooked and no trouble to pre-
pare or use.

Write for Pamphlet "How to Raise Calves
Cheaply and Success-
fully with Little or No Milk." At dealers, or
Coulson Poultry & Stock Feed Co., Inc.,
Petaluma.

BAKER'S TRACELESS HARNESS

Best plow rig. NO WHIFFLETREES—NO TRACES.
Handiest farm harness.

Indispensable in the orchard with special fitness for
all low down work. You can hitch closer to your
load, plow and cultivate close to the row and save
all the worry to man and team. No weight of
whiffletrees for man to lug. Everything clear behind
team. Use our outfit and save your trees. Highest
endorsement of farmers and fruit growers.

YEARLING JERSEY BULL

Register of Merit Ancestors.
Dam, Mae of Venadera, Sire, Thomas Exite King
A splendid show bull, well grown and ready
for service—PRICE, \$100.

Also full brother to above, 3 mos. old,
Price, \$75.

For particulars address
E. E. Greenough, R. No. 3, Merced, Cal.

swollen from the stifle to the hock.
He lies down most of the time with
legs stretched out and generally has
to be helped up. He urinates fre-
quently and the urine is of a whitish
color. His feed has been wild hay.
I am now giving him chopped barley
and wheat bran. Has a good appe-
tite.—E. M. C., Eagleville.

Give the colt one pound Glauber's
Salts dissolved in warm water, then
follow with this prescription: Hexa-
methylamine one dram, sodium
salicylate one dram and fluid extract
colchicum one-half dram. This dose
to be dissolved in water and given
to the colt twice a day.

MARE'S KIDNEYS BAD.

To the Editor: One of my mares is
in bad condition. Eats well, feels
well, but does not stand the work,
stays thin standing in the barn. Kid-
neys are bad; frequent and copious
urine often contains sediment. Af-
ter standing she lifts her hind legs
up and seems to have difficulty get-
ting them down again. Feed alfalfa
hay and barley. Oat hay acted on the
kidneys so bad I had to stop it.—H.
P. M., Ripon.

Quit feeding alfalfa altogether.
Give the following: Fluid extract
nux vomica 2 ounces, fluid extract
gentian 2 ounces, fluid extract cas-
cara 2 ounces, Fowler's Solution
enough to make 16 ounces. Give
two tablespoonfuls of this twice a
day.

SWELLING ABOVE HOOF.

To the Editor: About three months
ago my pony became lame. I noticed
a little scratch from which the blood
trickled. I put some turpentine on
the wound. Soon a swelling ap-
peared above the hoof and I had the
shoe removed. I poulticed it with
flaxseed and pus ran out a little.
The last month I have been using
gasoline and sometimes kerosene,
also Black Horse and XXX liniments.
Put lime on the sore.—C. H. P.,
Santa Clara.

Your pony has developed a quitter,
and an operation is the only means
which will afford relief. Consult
your veterinarian.

PUS IN MARE'S FOOT.

To the Editor: Three months ago
a 12-year mare went lame. I turned
her out to pasture and yesterday
found her frog was full of pus. Foot
is not feverish or sensitive nor the
leg swollen, but she limps.—M. F. M.,
Santa Margarita.

If you had examined the foot thor-
oughly when horse went lame you
would have found that a nail had
punctured the foot. Clean out all
the dead horn and pack the tract
right down to the bottom with cot-
ton soaked with tincture of iodine.

TO CHECK BLEEDING BAG.

To the Editor: What is the best
way to check a blood vessel to pre-
vent an animal bleeding to death be-
fore veterinarian arrives? How can
we prevent blood poison? I want
something to keep on hand. A cow
cut a vessel in her bag.—M. P. De-
lano.

Pack the wound tightly with cot-
ton soaked in tincture of iron and
bandage this tightly in place.

WORMS IN COW'S BACK.

To the Editor: My cow on pasture
got grub worms in her back.—J. D.,
San Leandro.

Consult old issues for treatment
of this trouble.

Raising Poultry for Profit

WHY IT PAYS TO USE PURE-BRED FOWLS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The first question a person asks who is thinking of going into the poultry business is, Does it pay to buy purebred fowls? Generally they add to the inquiry the information that they only want them for utility, which in plain terms means profit. But the trouble is, most folks get mixed up in the meaning of "utility." They think "utility" means a scraggy, mongrel-looking hen, of no particular color, shape, or breed.

This idea is all wrong, because a real utility fowl can and should be a good-looking fowl as well as an industrious one. By purchasing purebred fowls you are getting the concentrated knowledge of the best breeders and originators of fowls, who know. They had one particular idea in mind in originating the breed, and their idea has been backed up and every good quality increased and perpetuated by subsequent breedings, by culling and selecting for the best qualities in the original breed.

Now, unless we exempt bantams and a few ornamental varieties, it is safe to say that originators and breeders had in mind the utility of the fowls they went to work on.

A few words on crosses are here necessary. A cross is the result of using the male of one pure-bred fowl on the female of another; but you must have confirmative evidence that both were really pure-bred specimens of the breeds they represent; if you have not this evidence you simply produce another mongrel to the already big list, and it will be of no more value than any other specimen of the mongrel breeds. Intelligent line breeding—that is, breeding the one strain of the same breed, without crossing the blood strain by introduction of outside blood—requires skill; but when it is practiced right, it brings out the best qualities of the breed, not merely for show purposes, but for utility purposes.

If I have a few hens, say but four, of known laying merits, and I have a male from one of those hens and an equally good sire, I can safely breed those five for one year and get a number of good hens. But if I just hatch eggs from all hens having the same color and other features, I am merely perpetuating the species, even though I buy new blood every year. So that pure-bred poultry have been bred for a definite purpose, while the mongrel has always been a haphazard proposition that turns out like a boy pitching pennies—heads or tails, just what happens to fall face up.

The pure-bred fowls, even in Leghorns, are so badly mixed up one hardly knows where to find one; but believe me, it pays to get a few and breed up from them, provided you want Leghorns. The farmer and small rancher, however, should not tie himself to Leghorns. He needs something which, when he gets through with it, he can get more for than he has spent in raising it. This cannot be said of the small breeds; but when you get to the brown-egg

breeds, it is simply a matter of choice which will bring in more money for table purposes after they have served their purpose as layers than it cost to raise them. Sometimes, I admit, we may get good result from a cross, but it is simply guess-work. One time I tried Houdan on Buff Orpingtons, and they gave me the horrors till I got rid of them. Now, the Houdan, when well bred, in some localities, is a splendid fowl for the farmer. It has more breast meat in proportion to size than many larger breeds, it is docile, easy to fence, and lays a large white egg—as large, in fact, as the black Minorca. But in localities where they have fleas, the fleas get in the topknots and drive the hens crazy; and in other localities where there are hawks, the topknot makes the Houdan an easy prey for hawks.

However, I am not going to exploit any particular breed; they are all good if bred right, fed right, and housed right. One man or woman will take a pen of fowls and make them lay and pay, then turn them over to another person who may be equally earnest, but somewhere he lacks in judgment, and the same fowls are a loss financially. The difference lies in the people, not in the fowls at all, and very often it is just a simple cause that merely wants to be understood in order to make the adjustment. If you cannot make that adjustment yourself and find out the thing needed for yourself, no amount of talking will give it to you. It's what in animals we call instinct, I guess, and textbooks call it "intuition"; but it's one and the same thing, and if you have not got it I can't tell you where they make it.

A HIGH-PERCENTAGE HATCH OF EGGS.

[Written for Pacific Rural Press.]

We found John W. Johnston of Imperial county in his incubator cellar busily testing eggs that had been in four days. The regularity with which he returned them to the tray made us marvel; and he told us that out of 1590 just tested, only 108 had proved infertile or dead germs. During his six-months hatching season last year, he sold 10,000 baby chicks and kept over a thousand for himself. These represented 80 per cent of the eggs he had put into the incubators.

Several reasons were given for the remarkable fertility and strength of the eggs being set in mid-January, when we would ordinarily expect weak eggs. The principal reason is, perhaps, vigorous cocks. When a cock gets a harem which does not run away from him, but goes with him about the fields, one that hoganizes well, and acts vigorous, he is retained. A cock with a "henly" head, one which tries to hobnob with all the hens, and runs when another cock gets after him, is not popular with the hens and is not a good breeder. Of vigorous cocks about one per 15 hens is kept, and is found sufficient on the open range.

The second main point is vigorous hens. They have a 40-acre alfalfa-

threshed because the hens get enough exercise in the alfalfa. A mill-feed mash is fed with all the skim milk the hens want. Twenty-one cows are now milked, the first ones having been bought so skim milk would be available for poultry. Now the surplus skim milk is fed to hogs.

Care of Eggs.—The eggs are not allowed to get over seven days old, though Mr. Johnston has had good hatches from eggs 14 days old. They hatch better if set fresh, however. They are put into egg cases when gathered; and each night one or the other end of the case is propped up several inches. The raising of ends alternately every 24 hours shifts the yolks and keeps them from sticking.

The incubator cellar has 5000-egg capacity, with the possibility of double-decking the incubators. It was dug three feet into the ground and a low wooden A-roofed shed built over it so there is plenty of standing room. A ventilator in the ridge lets out some of the hot air; though it was comfortably warm at the time of our visit. Mr. Johnston was then beginning the incubation of a 6000-chick order.

QUESTIONS AND ANSWERS.

Squabs — Chickens — Rabbits.—Tell me, please, which is the most profitable for the person of limited means, squab raising or chickens, and is a broiler plant practical? Where can I get a book on rabbits, raising, mating and feeding?—Marie L., Newman.

The squab market is not always reliable, but chickens are always salable, so it is much safer to go into chickens, as the returns are quick and sure. Yes, a broiler plant is both practical and profitable if run right. For a good book on rabbits write to Mr. Frank H. Snow, editor of Petaluma Poultry Journal, Petaluma.

Dropsy of Legs.—We have a hen whose legs are swollen to three times normal size, now going to the toes, legs are soft and puffy. Seems to feel good, eat good, and is laying. What is the cause and cure?—Mrs. J. W., Mitchell.

This is dropsy of legs or gout. Cause is cold ground and lack of exercise that has made the circulation sluggish. Nothing wrong organically. Give a few doses of castor oil, say one tablespoonful three times during a week, or every other day. Put some litter in scratching pen or feeding ground and feed plain, unstimulating feed. But plenty of exercise will solve the question.

Rabbits with Sore Ears?—What is the cause of my rabbit does getting sores and scales inside their ears?—F. F. U., Napa.

[Answered by Geo. H. Croley.]

Among rabbit breeders it is the most common belief that this trouble is due to a parasite that is carried to the hutch with the grain or fodder. As a remedy some breeders have obtained satisfactory results through several treatments with peroxide of hydrogen. Apply this with a sponge or soft cloth. If the ears have become very much inflamed dress them with finely powdered boracic acid, carefully dusting this over the affected surfaces. Handle the ears very carefully to avoid pain, increased irritation and spreading of the sores.

POULTRY NOTES.

An oversupply of fats or oils, particularly vegetable oils, is the most common cause of unseasonable or repeated moultings.

Two trios of Rhode Island Reds and one of Rhode Island Whites, all from winners at the Panama-Pacific International Exposition, were recently shipped to New Zealand.

A convention of poultry keepers of South Africa recently met at Port Elizabeth. Great interest was manifested over the rapid development of the industry in that part of the world.

Prevent toe picking by giving chicks salt water. Mix one teaspoonful of salt in one quart of water. Give chicks one drink of this each morning, then substitute fresh water for the rest of the day.

A swallow of loose, moist earth for the hens will increase egg production in the dry summer months.

A trap nest has been recently invented that releases the hen after she has laid an egg. The egg in rolling into a wire basket opens a door to a yard reserved only for the hens that have laid an egg.

"We have a lot of milk now for the chickens and I believe it is valuable now that feed is so high. Where I sell my chickens, they want milk-fed ones, and I get two to three cents above market price for them when the young ones are fattened," writes Noble H. Brown of Lodi.

At a large enthusiastic meeting of farmers at Imperial recently, Dr. Elwood Mead endorsed the proposed \$2,500,000 bond issue for irrigation improvements in Imperial Valley.

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

EXTRA QUALITY White Leghorn chicks, 12c until March 1st, then 10c. Carefully line bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying, and lose a dollar per pullet in raising; get the Best and Succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—200 acres devoted to superb vigorous Hogenized White Leghorns. Bigelow chicks are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. Shipped on approval; examination before paying. The Bigelow Poultry Ranch, Sonoma, Cal.

HIGHEST CLASS—Winners at State Fair, Oakland, Modesto, Reno. White Rocks and White Leghorns. Incubator chicks. Rocks, \$25.00 per 100; Leghorns, 10.00 per 100; Hatching Eggs, \$2.00; \$5.00, and \$10.00 per 15, according to quality. Rock Eggs, \$10.00 per 100; Leghorn Eggs, \$6.00 per 100, from range flocks. The best of stock and a fair deal. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

MAMMOTH BRONZE TURKEYS—We are now booking orders for Eggs. Guaranteed Eastern Strains of rapid maturity. 1st-prize winners at 1916 State Fair and P. P. I. B. Correspondence solicited. John G. Mee, St. Helena, Cal.

THOROUGHbred French Rouen Duck Eggs for hatching from winners at San Jose, Oakland and Arizona shows. Also Bourbon Red Turkey eggs. Mrs. Emma V. Miller, Farmington, Cal.

BRONZE TURKEYS—Young Toms for sale. No more eggs till further notice. Free circulars. Albert M. Hart, Clements, Cal.

COLORED MUSCOVY DUCKS—Quiet, quackless. Weigh up to 10 lbs. Good layers. Eggs, \$1.00 for 12. P. M. Cox, Sonoma, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood

Writer and Breeder Of Utility Poultry.

160 pages of text, besides many full-page illustrations. Cloth bound.

This Book Will Help You in the Many Details of POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

PRICE, \$1.00 PER COPY, POSTPAID

PACIFIC RURAL PRESS, San Francisco.

CALIFORNIA Hog Book

A Practical Treatise on Hog Raising in California

By W. S. Guilford,

Director of Agriculture, Sacramento Valley Irrigation Company and a practical swine breeder.

First Edition—1916

256 pages of text; 31 pages half-tone engravings, besides line cuts. Cloth bound.

The author has had large personal experience in hog breeding, besides the opportunity of observing many plants in this and other States. He has brought together a wealth of practical and scientific information concerning the hog, its anatomy, the breeding, feeding, marketing, as well as diseases and remedies.

Price, \$2.00 per Copy, Postpaid.

PACIFIC RURAL PRESS, Publishers. 525 MARKET STREET, SAN FRANCISCO.

S. C. WHITE LEGHORN CHICKS.—You can pay more, but you will get no better chicks. My strain has been bred for years for egg production and vitality. Your order will have my personal attention, the eggs gathered, selected, incubated, the chicks boxed and shipped to you by me. Satisfaction to you is my motto. H. R. Teal, Whittier, Cal.

VICTOR BROODERS

Better than a Hen

Defeated all other makes at P. P. I. B. Heat evenly distributed over all chicks. Chicks don't crowd, trample and smother each other. Safe to operate. VICTOR BROODERS raise more chicks than a hen, carry no lice, make no crimples. Raise your chicks with VICTOR INCUBATORS and BROODERS. Keep the hens laying. Ironclad guarantee with machine. Send for FREE booklet.

VICTOR INCUBATOR CO. 1376 Market St., San Francisco

Mrs. Best's Letter.

SPRING STYLES.

Dear Friends: The shop windows are now gay with the bright colors of the new spring togs. Pure color as usual in the early spring, is seen everywhere. The sports' influence of last summer continues this year, only instead of the rose and blue so predominant then, there are canary yellows, Chinese blues, and various reds.

Separate skirts in wool plaids are shown regularly plaited. Heavy silks and washable satins, also in vivid colors or stripes on a light background, gathered with an inch heading and decorated with round patch pockets.

New Sweaters.

Silk sweaters are shown in the same styles—sailor collars and sash, but divided at the waist line in color, half being plain and the other half of a contrasting color in plaid. Wool sweaters in middy styles that slip over the head, called "slip-ons," are made of Shetland wool in loose weaves in soft colors with contrasting sailor collar and close-fitting cuffs. Some of these lace up at the neck like a middy blouse.

These loosely woven sweaters are much in vogue now, and many people are making their own. The size of the knitting needle determines the appearance, of course, and the large needles are used for the more fashionable weaves. About a pound of wool makes a medium-sized sweater.—ninety stitches across the back and fifty for each side of the front. Many of the home-made sweaters have kimona sleeves knitted right on to the body. In making a sweater knit across the back evenly until the desired length is reached, measuring from under the arms. Most of the garments cover the hips well. Then knit straight across 65 additional stitches on both sides of the back for the length of the sleeve. Continue thusly until the desired width of the sleeve is reached. The fronts are then knitted separately, shaping them for the neck, and then join onto the back. The neck should be one-third of the distance across the shoulder for a loosely fitting sweater. Shetland wool for the light jersey and Germantown for the heavier is used. And for the collars and cuffs the Angora wool can be bought now, which puts the new finishing touch to this spring's sweaters. Buttons may be knitted to cover molds, or fancy bone buttons may be used.

The new garment, the coat dress, is proving very popular. It is shown in jerseys, sport silks, and serge. The dress is conservative in style and designed so that with a fur it looks perfectly appropriate for street wear. As you know, in San Francisco women always wear suits or coats on the street, and so this dress, assimilating a coat, fits in well. One shop showed such dresses of blue serge, some with fancy vests of bright blue, embroidered in gold; others perfectly plain, even devoid of a white collar. Another shop displayed a wine red jersey cloth dress, which was embroidered in a dainty pattern with bright blue and purple—this was quite a color combination, but it was well planned, and was not garish. The same window held a canary-colored silk, narrowly striped

THE HOME CIRCLE

with blue and black fashioned into a sport suit.

Spring Parasols.

Parasols are very gay and coquetish. They are flat and small, and made of Roman striped ribbon or of Kaiki Kool silk in the new designs. They seem very suggestive of warm days and of course are advance styles.

Dress Coats.

One shop displayed a chic dress coat of bright blue taffeta. It was three-quarters length and very full, being plaited at the neck. The sleeves were large and like big puffs and made of blue taffeta embroidered in silver, while the rest of the coat was plain blue. There was a plaited ruff around the collar that stood up straight, and added dignity, which was then demurely removed by the ruffles at the wrist. It was certainly a most novel coat. It had style and did not sacrifice good taste. A coat similar in style was made of rose and blue satin, the rose being the dominant color, but the blue managed to appear on the soft collar and peeping out as a careless gesture showed the lining. All the evening wraps displayed with the light evening dresses seem very loose and full, of beautiful stuffs, and of bright colorings.

Beaded Bags.

The beaded bags seem just as popular as ever. With spring they have become brighter and more elaborate. Fancy shapes are shown, and the silk back ground is hardly seen in the heavy beading.

Pretty Blouses.

New blouses are of the same general style—soft collar, ruffles down the front, low neck and long sleeved. Crepe de chine and Georgette embroidered, or hemstitched, or picoté in flesh or white compose the pretty conservative blouses. Bright striped tub silks and striped Georgette, too, is shown for sport wear.

Rosabella Best.

RICE AND HOMINY RECIPES.

Why not use rice or hominy in the place of potatoes during the time of shortage, or until the new crop is harvested? Both rice and hominy are cheap and nourishing, and either will take the place of potatoes. Here are a few recipes that are good. Try them.

Hominy, Southern Style.—Mix one cup boiling water with one teaspoon salt and add gradually, while stirring constantly, three-fourths cup fine hominy. Bring to boiling point and let boil two minutes. Then cook in double boiler until water is absorbed. Add one cup milk, stirring thoroughly, and cook one hour. Remove from range and add one-fourth cup butter, one tablespoon sugar, one egg slightly beaten, and one cup

milk. Turn into a buttered dish and bake in a slow oven one hour.

Fried Hominy.—Take prepared hominy and fry in bacon fat; serve piping hot with syrup. Both appetizing and nourishing.

Hominy and Horseradish Croquettes.—Steam one-fourth cup hominy with one-half cup boiling water until water is absorbed; then add one-half teaspoon salt, three-fourths cup scalded milk, and steam until tender. Add two tablespoons butter and three and one-half teaspoons grated horseradish root. Cool, shape, dip in crumbs, egg and crumbs, fry in deep fat and drain on brown paper.

Strawberry Sauce.—Work one-half cup butter until creamy, using a wooden spoon; then add gradually while beating constantly, one and one-half cups powdered sugar. Wash and hull one quart box strawberries, cut in halves, and let stand in a warm place fifteen minutes. Add to butter and sugar mixture, and beat until well blended.

Parched Rice, Tomato Sauce.—Cook three-fourths cup rice in boiling salted water until kernels are soft. Drain, pour over one quart hot water and let stand until cool and dry. Put two tablespoons butter in hot iron frying pan and when melted add rice, and cook until rice is slightly browned, stirring lightly with a fork. Put in a hot serving-dish, pour over one cup hot tomato sauce and sprinkle with one-half cup grated cheese, lifting rice with fork that sauce and cheese may coat each kernel.

Compote of Rice with Stewed Pears.—Steam-cook one-half cup rice, using one-half milk and one-half water. When kernels are soft add three tablespoons sugar, and the yolks of two eggs, slightly beaten. Mound on a flat dish in conical shape and place on rice halves of stewed pears. Sprinkle all with one-fourth cup finely chopped Canton ginger.

Rice Chinese or Southern Style.—So many people like rice the way the Chinese and Southern cooks prepare it, but do not know how it is done. Here is a very simple formula—in fact, it is so simple that it can hardly be called a recipe. The whole thing depends upon one item, viz., plenty of boiling water; so that the rice will boil and "gallop" each grain by itself. This prevents it from getting mushy. You cannot use too much water—at least two quarts to a cup of rice. When the rice is cooked, but not too soft, drain through a colander and wash off with running cold water. This separates the grains. Now pack into a deep bowl and stand in a vessel partly full of hot water and dry out the rice by letting the water boil around the bowl. Of course the rice should be washed before cook, as well as after.

Floral Department.

[By Geo. N. Tyler.]

TUBEROUS BEGONIAS.

Tuberous-rooted begonias have been greatly improved the last few years, but amateurs do not have very much success with them, owing to lack of knowledge in their cultivation. These notes will help them to grow them as they should be grown.

Your first start should be made in late February or early March, from tubers obtained in a dormant condition. These place in pots corresponding to the sizes of the tubers—4, 5, or 6-inch pots will answer. Water sparingly after potting until they are well started, when they should not be allowed to become dry.

As soon as well started, and before they commence to form buds, they should be repotted, placing the strongest in eight-inch pots, using six and seven-inch pots for the others, and water again sparingly for a week or ten days, when they will have commenced to root.

You will find that they require a great deal of water as they grow and fill the pots with roots. In that stage you should give them once a week (when in a moist condition) a watering with weak liquid manure, or use nitrate of soda at the rate of one-eighth of an ounce to one gallon of water.

They will do well in any light soil. The compost I prefer is formed of three parts leaf-mould, one part loam, and one of well-decomposed cow manure, with an additional of enough sharp sand to show well through the mixture.

In potting drain your pots well. There is nothing better for the bottom than a few pieces of broken pots, with some moss over them—enough to prevent the soil from washing down.

At the first potting cover tubers with about one inch of soil, but when you repot, perform that operation with care and set slightly deeper.

Do not water tuberous begonias on the foliage; water only the soil they are growing in. It is advisable to remove the seed-bearing flowers. By doing so you will prolong the season of bloom and improve the quality of the flowers.

By the first of October they will be past their best blooming. You should then begin to dry them off. The best location for that purpose is a sheltered shady place out of doors. Give very little water, and when the growth dies off remove them in their pots to a cool basement or cellar away from fire or sun heat.

They should remain there without any watering until the end of the following February, when they should be removed to their flowering quarters, lightly watered, and as soon as growth starts repotted. In doing so remove all old soil. They dislike fire heat, and they need a cool house, slightly shaded and well ventilated, night and day. By well ventilated is meant enough fresh air to be comfortable for you to remain in there with no drafts; by right temperature, 65 to 70 degrees is correct; over that they will not do well. Should you have no greenhouse, they will grow and bloom to perfection in a window facing south.

Better than grandeur, better than gold,
Than rank and duties a thousandfold,
Is healthy body and mind at ease,
And simple pleasures that always please.
A heart that can feel for another's woe,
With sympathies large enough to enfold
All men as brothers, is better than gold.

AN ELEVATING CHOICE.

When I'm a grown-up man, Ill do
The things I've always wanted to.
I'll hunt rhinoceros and deer,
And go barefooted all the year.

I'll live in tents and swim all day,
And give my dress-up things away.
I'll never, never do the chores!
I'll always eat my meals outdoors,

And call for one whole choc'late cake,
The very minute that I wake.
But still, 'twould be such lots of joy
To be an elevator boy;

Fly up and down from floor to floor,
And oh, what fun to slam the door!
I guess that's what I'll do some day—
When I'm a man, grown-up and gray.

—Daisy D. Stephenson, in the
Churchman.

A TEA-PARTY TALE.

Marjorie was happy, there was no mistaking it. She skipped merrily down the street, and burst with a cheerful clatter into the nearest house:

"I'm going to have a tea-party all my own," she cried breathlessly to the two little next-door girls. "Aunt Lou said I might, and I want you both to come. She's going away this afternoon, Aunt Lou is, and she'll let"—Marjorie reserved this best until the last—"she'll let me use her dishes. They're the same ones Aunt Lou used to give her tea-parties with when she was a little girl."

"Oh!" cried Lois and Geraldine together, we'll go to your party for certain sure; just see if we won't."

Lois and Geraldine had been Marjorie's friends ever since she could remember. It seemed that they had played together always, for when they first learned to walk their wobbly, uncertain steps had led them toward each other. Geraldine was a little taller and bigger than the other two, but Lois and Marjorie were almost like sisters.

Aunt Lou didn't altogether understand little girls and their ways. She thought that if small people had plenty of bread and butter, and good, clean homes and faces, they ought to be perfectly happy.

Now this wonderful thing had happened; Aunt Lou had suggested that Marjorie have a tea-party, and had brought out delicious things to eat from a middle shelf, and her very own china tea-set from the tip-top shelf of all.

It seemed that Aunt Lou had been a little girl herself once upon a time, for there was the tea-set—that showed it plainly enough.

"I'll be ever so careful," Marjorie said, as she lifted them down and placed the precious pieces side by side.

Aunt Lou smiled and said, "I'm sure you will, Marjorie."

Aunt Lou had grown wonderfully kind and good of late. She even brought out the prettiest cloth for Marjorie's little table—a lacy cloth all starchy white that hung down over the edges.

It was a very happy trio that sat down to the small table spread for three. Marjorie had drawn up low chairs to sit on, chairs that weren't so high that their feet dangled uncomfortably a long way from the floor. These were the right kind.

They had cakes and jelly to eat, sparkling red jelly that shivered and shook. Marjorie filled up the cups, not with real tea, of course, but with

something better.

"You've got to hold the lid on," she explained as she poured out a cupful, "because it rattles round and falls out if you don't."

"Won't you have some more sugar?" Marjorie gave the bowl a little push toward Lois. A gentle shove it was, but the edge of the table was near, and the other things took up a lot of room; and so, though Lois's hand shot out to save it, she was a few seconds too late, and the plump bowl reeled and went crashing to the floor, where it lay in two broken pieces almost at Marjorie's feet!

"Oh, Marjorie!" cried Lois, with a frightened gasp.

In an instant the three chairs were forsaken, and Marjorie was bending over the jagged pieces of what had been a brave white sugar-bowl only a minute before. Her lips quivered pitifully, and the other two tried their best to comfort her. But the deed was done; it couldn't be helped now, and a sweet, sugary trail led over Aunt Lou's good carpet.

After the next-door girls had gone, Marjorie's heart grew heavy. What would Aunt Lou think? When she had been so kind about lending her dishes, how could Marjorie ever, ever tell her what had happened?

She picked up the pieces and placed them together. They fitted exactly, and from a little distance one would never know but that the sugar-bowl was perfectly good and whole.

A mean suggestion thrust itself into Marjorie's head. Suppose she put it back on the shelf just as it was. Aunt Lou might never know what had happened, not for some time, anyway.

But Marjorie's better nature won the day. She would do what was right—she would tell Aunt Lou herself that very night.

"Aunt Lou," she began bravely, "I'm sorry—I didn't mean to—but I"—

"Well?" Aunt Lou eyed her sharply. "I broke your white sugar-bowl!" Marjorie expected she hardly knew what after this confession, but nothing could have surprised her more than what Aunt Lou really did.

"Oh, is that all!" she cried in a relieved voice. "Bring it here, will you?"

"I broke it myself in the same place a long time ago," she said. "See where I had it mended so well that you could hardly find the place. We'll have it mended again, and I'll give them all to you to keep."

"O Aunt Lou!" cried Marjorie,

clinging to her. "I'll never be afraid to tell the truth again, never."

Aunt Lou held her tight for a minute, then kissed her, and said, "That's right, dear. Sometimes it takes courage, but it's always best."
—Gertrude Bowen, in Playmate.

USE RICE AS A VEGETABLE.

The high price and scarcity of potatoes has caused many restaurants in the cities to use rice as a vegetable, and the patrons seem to like it as well for a change as potatoes. Rice as served with meat orders is simply boiled and steamed and eaten with gravy or butter. While unpolished rice is said to be the best for food, yet the white, flaky, polished cereal looks better and people seem to prefer it.

MACARONI AND WELSH RAREBIT

Half pound macaroni, $\frac{1}{4}$ pound cheese, $\frac{1}{2}$ cup butter, 1 teaspoon salt, $\frac{1}{2}$ teaspoon paprika. Cook macaroni in rapidly boiling salted water (1 teaspoon salt to 1 quart water) until tender, grate cheese, melt butter. Put macaroni, cheese and butter in layers in baking dish, sprinkle with salt and paprika. There should be two layers. Place in oven ten minutes. Garnish of Welch rarebit: Melt $\frac{1}{4}$ pound cheese, add

Burning off the "Slash." The "slash" (bark, undergrowth, tops, etc.) burns off, but the logs simply char slightly. Only Redwood can be logged this way.

The wood that resists fire

Fire, that bugbear of the farmer, has small terrors for the man who builds with California Redwood.

Made fire-resistant by nature — contains no pitch. Extremely slow to ignite, slow burning and easily extinguished.

California Redwood

Resists Rot and Fire

California Redwood also has wonderful endurance. Not affected by dry or wet rot — even when in the ground — or changes of temperature.

When properly seasoned, will not shrink, swell or warp. And is easily worked.

The ideal wood for all farm structures from henhouse to silo, barn or farmhouse.

Write us today for free booklet, "California Redwood on the Farm."

If your local lumber dealer does not carry Redwood in stock, send us his name, and we will arrange so he can easily get it for you.

CALIFORNIA REDWOOD ASSOCIATION
771 NEW CALL BUILDING, SAN FRANCISCO, CAL.

Ask for the Child's Story of the Big Trees of California — there's a copy for every child in the nation.

$\frac{1}{2}$ teaspoon salt and $\frac{1}{4}$ teaspoon paprika and very gradually yolk of 1 egg, beaten and diluted with $\frac{1}{4}$ cup cream or rich milk, stir constantly until mixture is smooth. Spread upon diamond-shaped pieces of toasted bread, dispose these on macaroni and serve immediately.

SMALL ECONOMIES FOR THE HOUSEWIFE.

We have formed a habit of depending too much upon canned goods, which are comparatively expensive because of being composed in a large measure of water. In the purchasing of fruits for home use, the housewife can make some economies by purchasing dried fruits of various kinds.

Many housewives this year did not can much fruit for themselves. The price of fruit was high and the price of sugar was unusually high. Unless the home drying of fruit was undertaken the problem of supplying fruit will be an acute one.

Valuable friends to the economical and wise housekeeper are raisins, dates, figs, prunes and all dried fruits. Dried peaches, apricots, apples and pears are inexpensive from the food-value standpoint.

It is interesting to note also that dried fruits can be used in combination with cereals and in puddings in ways that are much more satisfactory than when using fresh or canned fruits.

Prunes and figs especially have a decided laxative effect. If you find that your dates and figs are too hard they may be softened and thus made more palatable by pouring boiling water over them.

Poisonous Cosmetics.

Some few issues back we were rash enough to say a few uncomplimentary words on face washes, bleaches and other "beautifying" agents guaranteed to transform the face of a gargoyle into that of a smiling seraph. We don't know that these preachments do much good, and more than half suspect that they are a waste of words. Still, it is some satisfaction to take an occasional whack at an evil even if you miss the mark. Then, too, our country cousins may not be so sophisticated as our city sisters, and need not this admonition—though it is whispered that they are rapidly "getting there." We find comfort in reading what another reckless writer has to say on the same subject, in the Journal of the American Medical Association. He lets loose thus wise: "Many cases of general nervous debility, some of insanity, and perhaps some of paralysis are caused by the use of cosmetics containing lead. Many of the vague and little understood abdominal pains of women are due to this cause, and abdominal sections have been done because of lead colic." "In reporting two additional cases of lead neuritis from cosmetics, he expresses the belief that among the thousands of girls who use preparations containing lead there must be many cases in which the untoward effects are not readily recognized as being due to lead poisoning and which are consequently overlooked. The relative infrequency with which lead poisoning is diagnosed in women leads one to believe that it must be often overlooked."

All of which might suggest that that portion of our femininity ambitious for something which unkind nature denied them, had better confine themselves to the use of such

simple cosmetics as creams, etc., of known composition.

Infant Feeding.

Last year in Missouri alone more than 7,000 babies died. Three-fourths of these children died before they were three months old. At least half of these babies could have been saved by proper feeding, in the opinion of Miss Louise Stanley of the University of Missouri College of Agriculture. It is very important that the child should have during these first months the best food, and nothing else is as good as that which nature has provided—mother's milk.

Mother's milk is best for the baby for the following reasons:

1. It is adapted to the needs of the child in composition and amount.
2. It is provided at the proper temperature.
3. It is more easily digested by the baby.
4. It does not sour.
5. It contains no bacteria and dirt.
6. It strengthens the baby against disease.

If mothers realized how much greater is the chance for life of the naturally fed child, they would make a greater effort to nourish their children. There are few mothers who can not with consistent effort nurse their babies. The mother must have abundant and wholesome food, plenty of liquids in the diet, plenty of rest, exercise and fresh air. Regular nursing stimulates the flow of milk.

Mineral Oil in Constipation.

This writer was asked last week if the purified mineral oil, of which "Russian Oil" is a type, has any virtue for the relief of constipation, and if it has incidentally any harmful effects. We believe it is both effective and harmless. Our experience has been confined largely to its use among children. We were first tempted to recommend it in a case where a child about four years old positively could not be induced to take castor oil. The child took the mineral substitute without objection, and in time, the mother said, came to rather like it. In other cases uniformly good results have been obtained. This oil acts as a mechanical lubricant of the large (or lower) intestine, and in this way helps the peristaltic action of the bowel. We cannot conceive of any harm arising from its use if the oil is thoroughly purified and free from foreign matters. For certain reasons we think it inadvisable to take it at meal time, or within an hour or two of the meal, either before or after. Food oils, like olive oil, are helpful in a similar manner, but are less effective, as they are absorbed, while the mineral oil passes through the body unchanged, and is practically inert.

Patent Medicines.

Better leave them alone. They are worse than a waste of money—they are a menace to health. There are perhaps half a dozen proprietary remedies or less, out of the thousands with which the market is flooded, that have some curative virtue, but even in these exceptional cases the remedy is likely to be abused by those given to too much self-doctoring. There is no manner of question that vastly more harm than good is done through the indiscriminate and excessive dosing fostered by patent medicine venders.

IN THE KITCHEN.

For most housewives, the kitchen is headquarters.

The whole household and adjoining premises work to better advantage if the wheels of kitchen machinery operate smoothly and turn out good things.

The two titles "housekeeper and homemaker" are usually vested in one and the same person, but if a woman finds herself unequal to both, it is far better to choose the latter.

"Think of it!
The price hasn't
gone up for
these fine
Clothes!"

Yes, think of it! It will pay you to look into this, see the fine clothes, try them on, and then be astonished that such fine style and sturdy wearing qualities can still be bought for \$17! A great demand centered on this suit of one nationally-known price has enabled the makers to effect great economies and keep the price \$17, as before. Get your suit today!

You know the price before you go into the store—\$17 always, everywhere. Watch your local newspapers for advertisements of the nearest Styleplus Store. Look for Styleplus in the Store Window. Look for the Styleplus Label in the coat collar. If there should not be a Styleplus Store in your town, ask your favorite dealer to order a Styleplus suit or overcoat for you.

SAN FRANCISCO.

San Francisco, March 7, 1917.

WHEAT.

Sonora wheat was the only variety which was offered here that failed to advance during the past week, this offering running largely to second grade stock and proving hard to sell. The rumor that more Australian stock would be brought here caused a slight flurry early in the week, but this proved to be baseless and prices came back to their old level. Northern Red is in especially good demand and is being held for \$3.20 per cental in most instances. Business in futures was without any great feature.

Sonora wheat \$2.75@2.80
Northern club Non-offered
Calif. Club, cti. 2.70@2.75
Northern Bluestem 3.00@3.10
Northern Red 3.90@3.20

BARLEY.

Easier prices on fancy seed barley was the only change occurring on this offering last week, with \$2.60 the general top here. The situation on futures still seems uncertain.

Seed, cti. \$2.50@2.60
Shipping, cti. 2.35@2.40
Brewing, cti. Nominal
Choice feed, cti. 2.25@2.30

OATS.

Trading in oats was probably quieter than for any of the other grain offerings during the past week. There was no export demand and local trading was very light indeed.

Red feed \$1.85@2.00
White 2.00@2.05
Red seed (Texas) 2.90@3.00

CORN.

Prices on corn were generally unchanged although the offering here of large quantities of dirty Egyptian brought a lower price range for this grade. Really fancy lots of this variety continued to command top prices. [First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, cti., bulk \$2.15@2.22 1/2
California, sacked 2.20@2.22 1/2
Milo Maize 2.00@2.20
Egyptian 2.25@2.35

BEANS.

While advances in the bean list were not so general this past week as during the preceding period, there were enough of these to show the general upward tendency of the market. Export trade and buying for the East has been of about equal volume and local buying has also been a considerable factor. Sales for a pool of small grocers was reported, their purchases being made in anticipation of still further advances here.

HAY.

A trio of causes have figured to bring a sharp decline in the receipts of hay at this market for the past week. This week's total was 764 tons, as compared with 1367 tons last week and 1817 tons for the preceding week. The main factor is the low stocks in the country, those having any hay on hand preferring to hold it for feeding to their own stock until the green feed is sufficiently advanced. The rains also figured in this state of affairs. Still another factor in the local shortage is the lack of hay cars. The new crop is reported to be progressing satisfactorily and no serious damage has been done by the few frosty mornings lately. All grades of hay were advanced here, the general gain being \$1 per ton. Export trade for the week was about average. Alfalfa hay and straw were both quite scarce and in very good demand and advances on these two lines would not be surprising.

[Price per ton, carlots, San Francisco.]

Wheat, No. 1 \$21.00@22.50
No. 2 19.00@21.00
Tame oats 19.00@23.00
Wild oats 18.00@21.00
Barley 18.00@21.00
Alfalfa 17.00@21.00
Stock hay 17.00@18.00
Straw, per bale90@1.15

FEEDSTUFFS.

Slack trading, light receipts and the rains combined to produce a quiet week in the feedstuffs market and prices on these offerings were without any change. It is reported on the street here that there will shortly be another advance in coconut meal.

[Per ton, San Francisco.]

Beet Pulp, per ton \$30.00@31.00
Alfalfa meal, per ton 23.00@24.00
Bran, per ton 30.00@31.00
Oil Cake 42.50@45.00
Coconut cake or meal 31.00@32.00
Cracked corn 48.50@49.50
Middlings 39.50@46.00
Rolled Barley 45.00@47.00
Tankage 47.00@48.00
Rolled oats 44.00@45.00
Rice middlings 31.00@33.00

POTATOES, ONIONS, ETC.

There has been a decidedly easier feeling in the local potato market for the past week but whether this easiness is to continue is a matter of considerable interest. The receipts of Washington potatoes here did a great deal to bring about the break in prices but it is doubtful whether the Northwest will be able to ship much more stock this way. On next Friday the Canadian government is to place an embargo

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

on the shipment of potatoes to the United States and this may bring a halt in the sending of Washington potatoes here. The continued offering of Japanese onions, and a slower retail call have been responsible for easier prices and stocks that were firmly held at \$13.00 per cental two weeks ago are now being offered freely at \$9.00. General vegetable prices have met with some changes, advances on peas and delta celery being the most notable of these. New rhubarb is being offered here now and commanding as high as 10 cents per pound.

Peas, per lb. 4 @11 c
Hubbard squash, per lb. 2 1/2 @3 1/2 c
Lettuce, crate \$1.00@1.50
Celery, Delta, crate 3.50@4.50

Salinas Cleaned up
Oregon 3.25@3.75
Sweets, per lb. 5 c
Onions 6.00@9.00
Garlic, lb. 3@5 c

POULTRY.

Weaker Eastern markets and the resumption of shipments from that section to this market have figured in an easier market tone, although this as yet has not taken the form of a big price decline. Buyers are inclined to be offish and only very light local receipts have served to hold this market steady.

Turkeys, live, lb. 22@24 c
do, dressed, large, lb. 26@28 c
Broilers, 18 lbs. to doz and less 32@35 c
do, over 18 lbs. to doz. 29@31 c

Belgian Hares (live) 13@15 c

BUTTER.

Butter prices have broken rather sharply this past week, the current receipts being too heavy for the local

Special Livestock Market Report.

San Francisco, Mar. 7, 1917.

The livestock situation in U. S. and California is peculiar. President A. T. Wilson of the Panhandle and Southwestern Stockmen's Association is quoted as having told the convention of that body on Mar. 5, 1917, that while there are 20,000,000 more people in U. S. than seven years ago, there are about 18,000,000 less cattle. Other figures indicate that the increased population is only 10,900,000; and the U. S. Dept. Agr. says that there were over a million more cattle in U. S. Jan. 1, 1917, than Jan. 1, 1916; although the production of meat and meat products in 1916 was 22,378,000,000 pounds or 3,000,000 pounds greater than in 1914. A local packer did 75 per cent greater business in 1916 than in 1915. Yet the price of steers for at least the past three months has been a good bit higher than for the winter of 1915-16 and the winter previous. In California probably half of the mature cattle are in packers' feed lots or under contract; while the remainder are being held by growers for higher prices. It is admitted by packers that the higher price is likely to come before the situation is relieved by grass cattle.

Steers, No. 1 9 1/2 @ 9 1/2 c
No. 2 8 1/2 @ 8 1/2 c
Cows and Heifers 7 1/2 @ 8 c
No. 2 7 @ 7 1/2 c
Bulls and Stags 6 @ 7 c
Calves, light 9 @ 9 1/2 c
Medium 8 1/2 @ 9 c
Heavy 7 @ 8 c
HOG receipts are small and all from California, while the price soars as told elsewhere. The quality seems not so good as months ago.

[Rough docked 20 pounds, piggy sows, 40 pounds, stags 30 pounds.]
100 to 150 lbs. 12 c
150 to 300 lbs. 12 1/2 @ 13 c
300 to 375 lbs. 12 1/2 @ 12 1/2 c

SHEEP are unavailable. Very few have come into San Francisco for a week except yearling lambs from packers' feed lots. Prices quoted are the same as last week, being merely nominal for lack of movement of stock.
Prime Wethers 10 1/2 @ 11 c
Ewes 8 1/2 @ 9 1/2 c
Lambs 12 1/2 @ 13 1/2 c

WOOL: No change is quoted in wool, as very little is being bought; and growers who have not contracted are looking for higher prices. Mendocino contracts are not yet being made. Pulled wools are very high back east. The English embargo keeps all wool from her colonies out of U. S. It is stated that while before about two years ago 75 per cent of mutton came from aged sheep, at least 60 per cent of mutton now comes from lambs, reducing the possible wool output of the future. About 1/4 of the Nevada spring clip is reported under contract, and nearly two-thirds of the Oregon clip, at prices considerably under those now prevailing.

Sacramento Valley, spring clip, 39@40c
Mendocino, year's Nominal
Southern, spring clip 28@30c
Southern, 7 months 15@18c
Imperial Valley, 7 mos. 14@15c
Nevada, year's 31@32c

HIDES and TALLOW: The present California hide market is ruled by peculiar circumstances and presents an almost unknown situation at present. There is a seasonal shortage of light hides on this Coast and the producer is being paid two cents per pound more for this type of hides than the Chicago tanners will pay, delivered at their front door. On the other hand, heavy stock is practically unsalable here and the East shows almost as little interest in this grading. Light hides are quoted at 22 cents delivered in Chicago and 24 1/2 @ 25 cents here. The tallow market looks very firm with prices quite high.

Steers 23 @ 25 c
Cows 23 @ 25 c
Light hides, 25 to 48 lbs. 25 @ 26 c
Kip 20 @ 22 c
Calf and veal 29 @ 30 c

Dry Hides 32 1/2 @ 33 1/2 c
Dry Kip 35 @ 36 c
Dry Veal and Calf 38 @ 40 c
Pelts, long wool \$3.25@3.50
Short wool 1.25@1.50
Horse hides, wet, large, ea. 5.00@5.50
dry, large 3.00@3.50

Los Angeles, March 6, 1917.

CATTLE: The past week brought no change in this market. Last week's prices were firmly maintained. Offerings were not heavy from either California or Arizona. Killers, while all in the market, were cautious buyers, only taking such lots as needed from day to day, showing no disposition to buy ahead, hoping for a weaker market as spring advances and the coming of grass. The Eastern markets are hardly so strong.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$9.00@9.50
Prime cows and heifers 7.50@8.00
Good cows and heifers 7.00@7.50

HOGS: Not so many hogs in the past week and prices reached the highest point here for many a long day. California and Arizona furnished all the supply. No Idaho hogs in the high prices East drawing them all that way. The Kansas City and Chicago markets paid such prices during the week as to justify shipping to those markets from the Imperial Valley.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. \$10.25@10.75
Mixed, 200@250 lbs. 10.75@11.75
Light, 175 @ 200 lbs. 10.75@11.75
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: While there is no change to note in this market from a week ago, it remains firm. Buying light at the high prices. Utah and Idaho continue to furnish what comes in. The high prices of wool making flockmasters more reluctant than ever to sell off their sheep. Lambing has been going on now for more than thirty days and it will not be long before spring lambs will be coming in, and this is expected to relieve the market.

Per cwt. f. o. b. Los Angeles:
Prime wethers \$9.00@10.00
Prime ewes 9.50@10.00
Yearlings 9.50@10.00
Lambs 13.00@14.00
CALVES: Market quiet. Offerings continue good and sales slow. Selling at \$3.50@3.50.

No. Portland, Ore., Mar. 5, 1917.

CATTLE: Today's receipts of cattle were quite a surprise to the trade, being much above expectations. A total of 1400 head were unloaded. Market was rather slow at the opening. One load of prime hay fed steers brought \$9.85 while another load brought \$9.80. A number of loads of light steers went from \$9.35 to 9.75; good steers sold from \$8.75 to 9.25 while medium grades brought \$8.00 to 8.50. There was a fairly good demand for all cow stuff, butchers were the most active bidders, especially for the off grades, one load of cows and a few heifers brought \$8.15 with a few other sales of good cows from \$7.50 to 8.00. The balance of the stuff was made up of dairy and half-fed cows which sold from \$6.50 to 7.25. A few prime heavy bulls brought \$7.25 while the bulk of good bulls brought \$7.25@7.75.

HOGS: There was but a light supply of hogs here today and prices took another sharp advance; a gain of 50 cents was in order on all sales. One load of prime light hogs brought \$13.50 while the bulk of sales were from \$13.25 to 13.35. Pigs sold up to \$12.25 with the bulk of bids at \$12.00.

SHEEP: Sheep prices scored another advance in both the sheep and lamb division. Best lambs brought \$12.90 to \$13.10; one load of yearling wethers sold at \$11.75, prime shorn yearlings brought \$10.00, while several loads of good mutton ewes brought \$9.75; demand was good and all supplies were moved readily.

trade to care for. Eastern quotations have been about steady but the differential between their figures and San Francisco quotations has not been such that shipping is warranted. One car left the State for the East during this period, but this was sold outright to the agent of a foreign government. The Northwest is buying rather freely here, Alaskan trade having opened up early this year. Prices, however, are still far in excess of the quotation in effect on the same dates last year.

EGGS.

A marked resumption of Eastern buying has been seen on this market during the past week and local dealers now look forward to steady prices as long as the quotations in the East warrant purchases here. During the past week nearly fourteen cars of eggs have been shipped out of this market, either by rail to the East or by water to Seattle, and this outside trade has proved a life saver to the market. Receipts are very heavy for this season of the year and any drop in the East is almost sure to precipitate another break here.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

CHEESE.

The Eastern demand for cheese has been so great that any stock which is offered on this market is immediately snapped up for Eastern account, and shipped from here with only a cursory inspection. As a result the prices on every type except Jack cheese have advanced and sales at the top figure on this type are more common.

Y. A.'s 22 1/2 c
Fancy Calif. Flats, per lb. 21 c
Monterey Cheese 16@20 c

DECIDUOUS FRUITS.

Deciduous fruits were without quotable change during the past week, with trading in this line somewhat lighter than the average for this season of the year.

Apples:
Bellflower, box \$.60 @ .75
Newtown 1.10@1.25

CITRUS FRUITS.

An advance on fancy grapefruit proved the only notable change on a very dull market. The high prices named by the Association have as yet failed to meet with popular approval and hand-to-mouth sales have been the rule. However, the retailers' supplies will soon be exhausted and they will then have to meet the asked prices.

Oranges:
Navels, fancy, per box \$2.40@2.75
do, choice 1.85@2.25
Tangerines 1.50@2.00
Lemons:
Fancy, per box 3.25@3.50
choice 2.50@2.75
Lemonettes 1.50@2.00
Grapefruit, fancy 2.25@3.00

DRIED FRUITS.

Most of the dried fruit trade, both from the packers' and the producers' ends, seemed to prefer to lean back and watch political developments in this past week, and very little trade in futures was reported. Spot trading is naturally light as only small holdings exist in this market.

[Net to growers, bulk basis, f. o. b. shipping point.]
Apples, new crop 5 1/2 @ 6 c
Apricots, per lb. 15 @ 16 1/2 c
Figs, black, 1916 6 @ 6 1/2 c
do, 1917 5 1/2 @ 6 1/2 c
do, white, 1917 6 @ 6 1/2 c
Callimyrna, 1917 9 @ 10 c
Prunes, 4-size basis, 1917 5 @ 5 1/2 c
Prunes, 1916 5 1/2 @ 7 1/2 c
Pears 6 @ 7 1/2 c
Peaches, 1917 6 @ 6 c

HOP.

That brewers anticipate a much decreased business as the result of the passage of the Reed "bone-dry" law by Congress last week became immediately apparent when the offered prices on all kinds of hops were sharply cut. Little or no trading was reported, as first hand holders are said to believe that a reaction will have to come.

Sacramento 7 @ 9c
Sonoma 7 1/2 @ 9c
Mendocino 8 @ 9c

LOS ANGELES.

Los Angeles, March 6, 1917.

BUTTER.
Receipts of week ending Mar. 6, 1917 —310,575.
Receipts of week ending Mar. 6, 1916 —351,600.

Receipts the past week were light for the time of year and with a very good consumptive demand prices were held steady up to Saturday, extras up to that time continuing to bring 35c. The general tone of the market was weak and only the firm markets East enabled holders to maintain old prices. Extras in Chicago were held firm at 40c through the week and extras in New York were 40 1/4 @ 41c up to Monday. With the opening of the current week the market here broke on Monday 1c, extras selling on call at 34c in anticipation of better receipts. Prices now are 8c higher than this time last year, and the feeling is that present prices are kept up solely by the light production. Tuesday the market on call broke 1c and trading light. Only 10 cubes of extra selling, 5 at 33 1/2 c and 5 at 33c.

Extra creamery 33c
Prime first 32c
First 31c

HOG PRICES BEYOND RECORD AND STILL GOING

Never in a half century have hogs been so high priced as they were about two weeks ago; and since then they have advanced nearly \$2.00 per cwt., being quoted March 6 in Chicago at \$14.75 for heavyweights, and being marked up in San Francisco Mar. 7 to \$13. This is in spite of the condition revealed by one large packer's statement that he had received twice as many hogs in Feb., 1917, as in Feb., 1916. On the Portland market, they have been 3½ to more than 4½ cents higher all the past winter than the high prices on corresponding days the previous winter which was generally considerably higher than the winter before. One load of prime light hogs sold Mar. 5 in Portland at \$13.50. At Los Angeles there was a 50-cent rise Mar. 6 over our quotations of a week before. The extreme prices are reducing herds to an extent that may mean a scarcity next year even greater than this.

Prices to growers in Southern California are considerably lower than in Sacramento Valley, with San Joaquin Valley prices intermediate between the two. Sharp competition with Oregon buyers even as far south as Glenn county has forced prices; and much stock is going to Portland from that section.

1917.	Wed.	Th.	Fri.	Sat.	Mon.	Tu.

EGGS.

Receipts (railroads) for week ending Mar. 6, 1917—3343 cases.
Receipts (railroads) for week ending Mar. 6, 1916—5327 cases.

There was more life in this market the past week than for some time. While receipts were very good and the Eastern markets declined prices here worked higher. Besides a good consumptive demand there was very good buying on storage account for March and April delivery, and this caused an advance in the cash market. Extras sold up 2½c till Monday, case count 4½c and pullets 3½c. Case counts are now 8c higher than this time last year. Chicago first lost ¼c and the New York market was weak. Tuesday brought little change in the market here. Trading on call was light and extra and pullets were the same as the day before. Case count, however, advanced 1c.

1917—	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Extra	23½	23½	25	25½	26	26
Cse Ct.	20½	20½	23	25	25	28

1916—						
Cse Ct.	18	18½	18	18	18	18

POULTRY.

There was further advance in this market the past week. No Eastern poultry in and the local receipts were light. This caused buyers to bid up higher for broilers, fryers, hens and roasters. Broilers were advanced 3c and fryers 2c and demand good at this improvement. Turkeys, ducks, and geese unchanged but firm under light offerings.

We quote from growers:	
Broilers, 1½ to 2 lbs.	32@33c
Fryers, 2½ to 3 lbs.	28c
Hens over 4 lbs.	22@23c
Hens, under 4 lbs.	21@22c
Ducks	22@23c

Geese	18@19c
Roosters, 3 lbs. up (soft bones)	25c
Turkeys, heavy, 12 lbs. and up	29@30c
Turkeys, light	24@25c
Squabs, live, per doz.	\$1.50@3.00
Dressed	3.75@4.85

CABBAGE AND CAULIFLOWER.

The market the past week went all to pieces. The receipts were not heavy, but the arrivals were poor and there was very little shipping demand for either cabbage or cauliflower. Home demand moderate and supply in excess of its requirements. Hence the sharp break in prices. Cabbage was dull at \$2.50@3.00 per cwt. against \$4.00@4.50 per cwt. a week ago. Cauliflower was 80c@1.00 per crate against \$1.40@1.50 a week ago and sales slow.

BEANS.

There was not much doing in this market the past week. The high prices caused buyers to hold back and go slow. Limas and whites remain unchanged, while pinks and blackeyes are higher, they not having advanced so fast as the white and limas heretofore.

We quote from growers:	
Limas	12.50@13.00
Large white	12.00@12.50
Small white	12.00@12.50
Pinks	8.25@8.50
Blackeyes	7.50@8.00
Tepary	5.75@6.25

HAY.

There was a general advance the past week in all hay. Receipts light and a very good demand was had both for alfalfa and grain hay. Local buying, however, was only moderate and mainly of alfalfa for dairy purposes, the bulk of the demand coming from the country. Receipts 79 cars.

We quote f. o. b. Los Angeles:	
Barley hay, ton	\$20.00@22.00
Oat hay, ton	21.00@23.00
Alfalfa, northern, ton	18.00@19.00
Alfalfa, local, ton	21.00@22.00
Straw, ton	11.00@12.00

many on sale. Lemons, while steady, were very slow sale, the best still bringing 1@1½c per pound in the grove picked. Poor stock has to sell for what it will bring.

AUCTION SALES.

New York, March 5.—Twenty-eight cars navel and two cars mixed oranges and five cars lemons sold. Market opened lower on navel but recovered before the close. Market easier on lemons. Snowing. California navel averaged \$1.50@3.10. Lemons averaged \$2.85@3.65.

Boston, March 6.—Thirteen cars sold. Market unchanged. California navel averaged \$2.10@3.20. Lemons averaged \$3.35@3.65.

Philadelphia, March 6.—Nine cars sold. Market unchanged on oranges, slightly lower on lemons. California navel averaged \$1.75@2.95. Lemons averaged \$2.50@4.35.

"Second Thousand Answered
Questions in California
Agriculture"

(Sequel to "1000 Questions in California Agriculture Answered")

By Edward J. Wickson,
Editor Pacific Rural Press

The second book is in no sense a revision or republication of its predecessor. Particular care has been taken that nothing in this volume shall be a duplication of the preceding one.
It is a most valuable book for reference for the California farmer. Solves without delay almost any problem in Fruit Growing, Vegetable Growing, Grains and Forage Crops, Soils, Fertilizers, Irrigation, Live Stock, Dairy, Feeding Animals, Diseases of Animals, Poultry Keeping, and Pests and Diseases of Plants.

1916 Edition—Fully Indexed. No trouble finding what you want.

Price, \$1.50, Postpaid.

PACIFIC RURAL PRESS

525 Market Street,

San Francisco

Over 250 new paid subscribers were added to our list during the past week. These subscribers pay \$1 per year for the Rural Press, and are secured without the use of premiums.

H. W. Brown, Palo Alto, writes: "I found the Rural Press an excellent advertising medium, as I have sold all my White Orpingtons through it. Have had a remarkable number of inquiries from all over the State."

J. W. Evans of Ceres, in remitting his subscription, says: "Your paper is to the agriculturists' well-being what the heart is to his physical well-being. In it lies the sleepless current of influence prompting to action."

We have just received a very handsome booklet issued by the California Almond Growers' Exchange, which gives the system they work under in handling most of the almonds grown in the State. The book also gives valuable statistical data relating to foreign and domestic shipments, also it contains pages of testimonials from satisfied dealers, customers of the Exchange. The almond growers can congratulate themselves upon the wonderful success made by their organization during the seven years of its existence.

HOLDING 1917 DRIED APRICOTS AND PRUNES

Packers are offering 15 cents to the growers for 1917 dried apricots and 5½ cents for 1917 prunes according to reliable authority. One packer refused to take orders at 14 cents packed which would easily permit him to pay growers 13½. But growers are holding tight and very few sales have been made. This is an exercise of good sense not always displayed in previous years. There is no telling what the crop or war conditions may be. A dried fruit exporter says there has been no export since Feb. 1 for lack of ship space. High freights and insurance, and difficulty in obtaining permits from England to supply European countries are added hindrance to export. But if the crop should be light, as a Santa Clara grower fears on account of rain and frost, America will use it all. The exporter mentioned believes that in case U. S. goes to war or if the war ends, dried fruit prices are sure to rise. If we remain in the present uncertainty, they may drop. At any rate there is no use selling until the probable crop is known.

15-35 Model E
Burns Kerosene

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

WHEN you buy a tractor you buy so much metal fashioned into a certain shape, because you expect it to render valuable service. You know that you cannot get more out of any machine than was put into it when built. Paint and fancy fixings do not make a tractor; therefore, buy a tractor that is built right, not merely for looks nor because of unproved claims.

Every year sees a stronger indorsement of the actual service that owners get out of the 15-35 Model E Sandusky Tractor. Built upon thoroughly tried and most exacting specifications, using only the best materials, on correct engineering principles, service and durability are put into it at the start.

The Sandusky Tractor has been thoroughly tested on hundreds of farms, and the universal verdict is that it is the standard by which tractor performance may be judged.

For great power, ease of handling, reliability and durability The Sandusky Tractor excels. Its direct drive on heavy duty work, its reserve power, and its scientific construction put it in a class by itself.

The Sandusky Tractor must demonstrate that it can do your work on your own farm before you can buy it. It will plow, harrow, disc, fill silos, shred fodder, saw wood, pump water,

build roads, and do all kinds of belt work more economically, more satisfactorily and more easily than any other method. With it you can prepare a better seed-bed, and do it at the right season, or cut your grain at the right time. It never tires, is not affected by climatic conditions, never gets sick, and it doesn't eat when it's idle.

Farming with The Sandusky is farming certainty. Then why buy any other than the best—why depend on immature or freak designs, much paint and loud talk to do the work that is to make your farm more profitable?

Brief Specifications

Our own four-cylinder, four-cycle, 5 x 6½ heavy duty, slow speed vertical motor; positive combination force feed and splash self-contained oiling system; Bennett air cleaner; three-speed selective transmission, 2 to 5½ miles per hour with direct drive on low; ideal three-point spring suspension; all steel construction; small over-all dimensions and short turning brakes; easily handled; surplus cooling capacity.

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book good for 200 hours of service goes with every Model E. This means expert service and help without charge when you want it. See catalog for details.

Our Binding Guarantee

We guarantee The Sandusky Tractor full 15 horse power at the drawbar and 35 on the belt pulley; capable of handling at least four 14-inch mold-board plows eight inches deep where a big team can pull a 12-inch plow six inches deep; to run belt machinery up to a 32-inch separator; to have one-third reserve over its drawbar rating, and for one year against defective workmanship and material.

BOOK E134FREE—A 40 page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the Sandusky Tractor. A copy will be mailed you upon request.

THE DAUCH MFG. CO., Sandusky, O.

If the Model E is too large for your requirements let us send you information covering our 10-20 Model J. Ask for booklet J-134

The Sandusky Tractors—both Models—are ready for inspection at and delivery from our principal Factory Branches and Service Stations at: Indianapolis, Ind.; Bloomington, Ill.; Milwaukee, Wis.; Lewistown, Mont.; Minot, N. Dak.; Fargo, N. Dak.; Sioux City, Iowa; Lincoln, Nebr.; Wichita, Kans.; Dallas, Texas; Leesburg, Fla.; Los Angeles, Cal.; Sacramento, Cal.

LOS ANGELES

Feeding Citrus Trees From Mangers.

[Written for Pacific Rural Press.]

A HUNDRED and forty thousand citrus trees have been basined by the National Orange Co. of Riverside County, according to E. A. Chase, to whose pioneering efforts the great citrus development of Riverside is largely due.

"We don't give advice, but point to our groves," says Mr. Chase. "We are satisfied with the basin system. Think we have great results so far, though we've been at it only two years."

In some cases, the basin levee is thrown up just outside the drip of the tree, and this is most favored by Mr. Chase, though it has drawbacks as mentioned below. Another way is to put the basin between two trees, leaving them on a narrow strip of dry ground between. On steep ground, two or more basins per tree may be necessary to avoid digging too deep on the upper side, for the bottoms must be level. Almost all of the basins are mulched with manure, bean straw, cheap alfalfa, weeds, prunings, fertilizer, etc. The advantages of mulched basining are: (1) the expense of cultivation is avoided.

(2) The ground, which gets "hard as bone" if not cultivated at just the right time after irrigation, is kept mellow and moist so angleworms may be kicked out with one's shoes any time during summer, and bacteria are permitted to be most active in making fertilizers available.

(3) Less water is used, though it is applied twice as often. The mulch prevents evaporation and baking; and because no cultivation is necessary, the frequent watering is possible. There would not be time for a cultivation after each of such frequent irrigations. This keeps the trees more evenly supplied with water; and as foreman S. H. Moulton of one of the orchards explained, "Though the basins were in poor shape last summer, we never wilted a tree." It is aimed to run the water three inches deep in the basin each irrigation. (4) Fertilizers of all kinds applied in the irrigated mulched basins are immediately in reach of the rootlets; for the basined ground is full of feeders up to the surface. Every inch of the rich surface dirt in a level basin is thus useful to the tree; while it is recognized that the surface dirt is entirely wasted by the ordinary system of summer cultivation. (5) More trees per acre are desirable, in order to use all of the ground. The Chases planted some trees 14x20 feet, and later took out some of them alternately, leaving them 20x28 feet.

That is now regarded as a mistake, since the basins have been put in. "We ought to crowd the land with trees," says Mr. Chase, "and if we were planting now, I think it would be best to put them 14x18 or 20 feet.

Level mulched basins for citrus trees permit most economical use of water and fertilizers, better use of land, better condition of soil without cultivation, better crops, and better tree growth.

between trees entirely used, especially where basins are built only large enough to catch the drip from the trees. Surface pipes are used on some of the steep orchards to carry the water. In the others it is run down a furrow between rows, and cut into each basin, filling it three inches deep and then passing to the next one. Then at the next irrigation the furrow is already open clear to the lower end, so the water is turned into the lower basin first, and then successively into the upper ones. Neither the furrow nor the center is cultivated at all. Thus it dries out and shows what the soil all over would be if not mulched, or cultivated at just the right time. It quickly gets hard as rock. Of course, no roots can grow in the centers, and they do not need to; for they have plenty of food available in the surface soil of their basins.

Wide centers should then be left at regular intervals for driveways.

How the Basins Are Handled.

—So far, none of the centers between rows are occupied by basins; and not in all cases are the spaces between basins occupied by trees. That is the reason closer setting is proposed. Another way to use this soil would be to enlarge the basins, leaving room for only a furrow between them. Perhaps that much soil per tree would be unnecessary; but the trees may need sunshine and air that would be precluded by closer planting. Still another way to use the centers would be to grow summer cover crops there to use for the mulch; but that requires more water than may be available.

About 100 pounds of dry mulch are needed per basin. Mr. Chase says they can't grow enough between the rows; and thinks perhaps water is too expensive to try it in summer. We had already noted in orchards at Corona that the winter cover crop was mowed twice and thrown into the basins. At the Riverside orchards, bur clover was expected to be knee-high before March 1. But most of the mulch is bought and hauled in. Spoiled alfalfa at \$8 per ton is considered cheap mulch and fertilizer. Prunings used as mulch ought to be chopped. Otherwise they hold everything so loose it dries out. The mulch should become compact and several inches thick or the ground in the basins will bake. Digging in some of the approved basins showed the ground loose, mellow, dark colored, filled with rootlets and angleworms.

The basins must be level all over the bottom, to soak all roots uniformly at every irrigation. This was not realized when they were first made; and much labor and root damage are being required to get them in shape now.

(Continued on page 328.)

Heavy annual crops are due to giving the trees the food and water they need where they can get it. Mulched basins have proved very economical and effective.

WHY IS IT A GOOD YEAR?

THE rains have come along in good sequence and with ample moisture—just as everyone had reason to expect, and no one right to deny. Such a March, if carried with equal step to the end, will insure full production, though the mid-winter run-off is of course less in such a year, and that is an ideal condition, for it insures production on the mesas and plains by its coming as needed, and keeps the rich lowlands open to make their grand contribution to abundance. The temperatures, too, though they do chill the slim shanks of lean and slippered Pantaloon, awaken new flame of prophecy in the flashing limbs of Pierrette. Thus the winds of a cold March in California hold fast the snow-masses in the mountains while the blossoms are bursting in the valleys and prophecy abundant water in the streams when the irrigation times begin in the foothills and out upon the plains. It is proving, in fact, a glorious type of winter for everything but grazing, and it is our own fault that we are pinched by that. If we exercise but one-tenth the foresight which farmers in wintry countries find essential to their safety in the way of storing roughage for stock, we can easily insure against loss of stock or sacrifice of value in buying feeds at rates above possibility of return. Beyond this one problem which it enforces, such a year as this is really the best we have because it opens all the good land to production with ample time for all the work needed to secure it. With such late rain the plains will make their crops from several months of seeding; the low lands will have but brief overflow or none; reclaimed lands will keep their levees solid; the irrigated lands will have long runs of water from retarded snow melting. It will be worth much to our own people and much to a hungry world that California will this year have all her lands in producing commission and all her people standing confidently and resolutely by the land.

VACANT LOT FARMING AGAIN.

WE SEEM to have shot ourselves quite a piece into the limelight by our objection to the popular obsession that all the ills in the food situation can be cured by turning vacant spaces in towns and cities into vegetable patches, either by municipal ordinances or by voluntary associations of urban people. It does seem very foolish to fly in the face of popular fervor, and it would probably serve us right if we should be publicly pelted into perdition with onions and potatoes, were it not clear that such manifestation of poetic justice would at this moment cost the public more than any worth of our demerits. It would be cheaper and better to do nothing so expensive and allow us to roast in the flames of popular indignation. For when the currents of popular fervor are turned on by enthusiasts, whose demagogic power waxes inversely as their knowledge of economics and horticulture wanes, these currents make short work of obstructions, and therefore we ought to be allowed to go out, with a sputter and a flash, by this electrical analogy. Still, while we are content to burn for the sake

of the truth which we believe to be in us, we must say a few words to show more clearly in just what our previous contentions have rested, and to warn the horticulturally and economically insane, who are promoting the idea of urban food production on the commercial basis of leasing land, hiring labor, and buying implements and supplies, as rural production has to be pursued, that such urban ventures, because of outlay, misdirected effort and reduced values of such products as are secured, are practically sure to be disappointing and unprofitable. On the other hand, growing stuff in one's own dooryard, largely with one's own muscle and materials and for one's own use, is likely to be a very interesting effort, if one has knowledge and taste for it, and profitable, too, because the outlay and risk are practically nothing.

WHY IT WILL NOT WORK.

THE chief cause for the popular misunderstanding of the matter seems to lie in the confusion in the minds of writers and speakers as to what might be and what should not be undertaken. The common reasoning seems to be if one can be encouraged to take his own spade, rake, and hoe, and dig, smooth, plant, and cultivate an area which his own family can compass therefore his town or his association of consumers could hire and buy and commercially crop the open spaces, which are now play-grounds for the kids in every neighborhood, and profitably produce foods for the city for less than farmers can and will produce them. In the propagation of this fallacy, in which promoters are, for their own personal vanity or perquisites, exciting the city people, the city papers are ignorantly helping them in this exploitation of public interest. This effort is based upon a fundamental misconception of commercial food production as a business requiring technical knowledge of several kinds without which the product will come to naught through wrong cultural practices, lack of protection against pests or other natural adversities and lack of skillful handling in other respects. Besides all these things, such production requires the attitude which a man or woman who makes good must assume toward his or her own business in the world and mastery of it, and that constitutes a farmer. Of course, one may live in the town and exert the attitude and mastery of a farmer in his farming business, but that is rather rare. For a city person, or a bunch of them, to undertake promotive, protective, and productive commercial farming on land which is not farming land, under conditions which are not farming conditions, and with a point of view which is not that of a farmer, would be as misplaced an effort as to build an ice factory in the boiling crater of Lassen's peak.

LAND BANKS GETTING TO WORK.

JUST as we go to press we receive the announcement that by appointments by the Farm Loan Board the twelve district land banks are now officered and will proceed at once with organization. The Berkeley Land Bank will open with the following officers: President, Burrell G. White of San Francisco; vice-president, R. L. Douglass, Fallon, Nevada; secretary, A. S. Reed, Los Angeles; treasurer, Dr. George W. Thomas, Logan, Utah. These officers and Dr. Elwood Mead of Berkeley will constitute the directorate. Lysander Casidy of Phoenix, Ariz., will be registrar and attorney. Commenting upon a recent announcement that the Farm Loan Board was getting into preparedness for the work, Orange Judd Farmer of last week says:

The splendid news is announced by the federal farm loan board that it has arranged for the sale of half its first issue of federal farm bonds bearing 4½% interest. The rate to be charged the farmers on loans will range between 5 and 5½%. From the number of applications from farmers wanting loans officials estimate that as high as \$50,000,000 in bonds may be issued within the first year. The government will place approximately \$8,370,000 at the disposal of the banks by subscribing for stock in the district banks. These funds will be drawn upon as fast as needed and although each bank will issue its own bonds the board will undertake the marketing of them.

We have been asked by those who have not

taken the pains to study the plan how banks which received such small stock subscriptions preliminary to their organization could expect to do any business. It must, of course, be understood that the total of such preliminary subscriptions was expected to be small, and therefore the law provided that the government should make the temporary investment which it is now making. As loans are granted, borrowers are required to subscribe for stock to an amount equal to 5 per cent of the loan in each case, and therefore the more loans made the more stock is subscribed, and when the amount becomes great enough the government will withdraw its investment, and the loan system will proceed by its own motive power, which is a three-cylinder motor: the money from the sale of bonds, the interest and amortization payments by borrowers, and the stock subscriptions of borrowers. The gasoline which this motor will consume consists of utmost economy in operation, of limited return to stockholders, and of exceptional security to investors in their bond-buying. The sparks which actuate all operations are low interest and abolition of fees to borrowers, small payments, and no costs of renewals, popular good will, which recognizes the obligation of the body politic to insure fair financing to the food producer and recognizes also security which inheres in exact appraisal of collateral property, and in a cost to the borrower which enables him to meet the obligation required to redeem it. All these things constitute a new system of banking, but they are based upon the principles which underlie all sound banking, although much practice of banking, in its relation to agriculture especially, has often widely departed from them.

WINE GRAPE MEN AND SALOONS.

IT IS pretty clear now that the grape men never should have joined hands with the hard-drink people to whom the saloons are indispensable. This unholy affiliation nearly cost the wine grape interest its very life, and manifestly the only way to save it now is in the repudiation of the hard-drink motive which brought it into such danger. The resolution of the wine interest to cut loose was announced in these columns as the result of a mass meeting of grape men in this city last January and a new declaration now appears in the resolution adopted by the California Grape Protective Association at its meeting in this city on March 10th. It was the result of a referendum by means of a postal vote obtained from the grape growers and wine makers throughout the State which showed a majority of five to one in favor of the Rominger bill now before the legislature for the regulation of the liquor traffic. In this way the wine grape interest pledges itself anew to the following: The reduction of saloons to one to every thousand inhabitants; Sunday and midnight closing, elimination of screened boxes in cafes and saloons and the abolition of dives and disreputable cafes, as well as the removal of saloons from the residence districts of cities. The break came from the hard-liquor men when the latter on consultation refused to concede any of the points necessary to such regulation as outlined. Thus is an issue squarely joined between the saloons and the wine interest as it should have been joined years ago. It now remains to be seen by legislative vote whether this declaration for decency on the part of the wine interest will save it from the punishment richly due to the bad company with which it formerly consorted—bad company which the world seems fast coming to the point of punishing with righteous anger.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., March 13, 1917:

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Scale on Boston Fern.

To the Editor: I am sending a specimen fern leaf. Please tell me cause of scale and how I can get rid of it. This fern is a large one and there is a great amount of this scale on it.—K. R. G., Honcut.

Your Boston fern has rather a bad infestation of hemispherical scale of which the mature form is about an eighth of an inch in diameter and as smooth, roundish, and brown as half a filbert. It is a very common pest on house and greenhouse plants. Where only a few plants are infested it is easiest to clean them off by hand just as you would any other piece of home bric-a-brac. In the case of a fern it is a good time to do it at once, for now you probably have more mature fronds and less new growth than at any other time of the year. Remove and burn about half the old leaves, cutting low and taking those which seem oldest by color and aspect. This will allow you free access to those you retain. Go up and down each of these with an old tooth-brush, scrubbing and dipping frequently into laundry soapsuds. You must not only dislodge the old brown scales but clean the whole surface of each frond to remove young scales which you may not clearly see. Then give the plant a good shower bath with clean water and watch it for survivals.

Of course we cannot tell you the "cause" of the scale. It is just as much an earth inhabiting animal as we are ourselves and probably a good deal more efficient in its life work. It is on your fern because it had sense enough to catch on to a good thing and it will not easily let go.

Smut on Olive Scions.

To the Editor: Please advise me a safe, sure and simple way to kill "smut" on some olive scions I have received from the southern part of the State. Of course I wish it to be harmless to the vitality of the scions.—H. R. B., Reedley.

It is not the smut you need to remove from the scions. It does not at all matter whether you remove that or not. The danger lies not in smut but in the insect upon whose exudations the smut grew. It is the insect which has the power to bring your trees to distress: the smut is only the visiting card of the insect. But you must be sure that any insects which are on the scions shall be dead ones. If you have only a few stiff-wood scions you can wash them off with laundry soapsuds—rubbing firmly, but not too hard, with a soft rag. If you have too many for that or too small brush, you can kill everything by putting it in a tight barrel, box or tank, and rigging a tight cover of some kind. Then put on top of the packed-in stuff a dish with 1 oz. of squirrel bisulphide to each 12 cubic feet in the receptacle and clap on the lid tight and leave it on 40 minutes. Then everything will be dead and the cuttings unhurt. You may be dead too if you don't leave your pipe on top of the clock in the kitchen before you start in on the job.

Irrigation During Blooming.

To the Editor: Is any injury occasioned by irrigating peach trees when in full bloom?—J. A. E., Modesto.

There has not been demonstrated to be. Trees of all kinds are irrigated during blooming when the water comes then, and though there has always been some impression that it is not a good practice, such fact has not been proved up and isolated as to cause so that it could not be otherwise attributable. For our own part we should be more scared of irrigating a short time after blooming because fruit is more apt to be upset then than in the flower. Until some one scientifically proves something about it, we should plan to skip the whole period by filling the ground up before the buds swell (if the rains do not do it) and let the next come when the fruit is seen to be taking hold well. This would be particularly desirable if one was using very cold water in deep checks or basins. There are other reasons to think that the plant may be seri-

ously disturbed by being suddenly cooled off while in action—but with water at ordinary temperatures or warmed by running in furrows we would take the chances of the wrong time rather than to let the tree go dry.

Garbanzos.

To the Editor: When is the proper time for planting Garbanzo beans? Is there a good market for them? Would they do well on heavy loam soil along the Merced river? The land has been flooded by river and is now in fine shape for plowing. Can they be planted this month and harvested in June? What is the average market price for them in San Francisco?—L. F., Turlock.

Garbanzos are not beans, and will not sell for beans. They are near-peas, and their English name is chick-pea. They are in their manner of growth and their uses more like lentils, but in their appearance more like a lop-sided pea. They ought to do well on such land as you describe, but they are likely to require more time for ripening than you give. The price is uncertain, though you might find some one to contract for them. They are not much used by Americans. Money has been made in the past by shipping them to Mexico, but our relations with Mexico are a little rickety now. We would rather be caught growing straight American beans than garbanzos.

No Great Chance in Hoarhound.

To the Editor: A friend of mine has forty acres covered with hoarhound. Is this medicinal plant of any value commercially. If so, how is it cured? Are the roots used, or just the stalks?—D. S., Dos Palos.

Hoarhound is an abundant weed all the way from the Cliff House to Cape Cod. Any one who wants it can gather it off the landscape. Commercial herbalists dry and pack the leaves in forms convenient for the trade, and have the business in this and other abundant "yarbs" so organized that it is hard for an amateur gatherer to break into the trade profitably. These herb-packers contract with regular collectors who could easily supply a million times the present output if they could make wages at it. The desirable part of the plant is the leaves, which are dried and packed in small parcels for retail druggists and in bulk to candy makers. It is the decoction of these dried leaves which is usually employed for medicinal purposes. Candy-makers are the largest users, and effort to make a contract with them is the first thing to undertake if you wish to push the project.

Lentils Not Popular.

To the Editor: Please give information on the growing of lentils in this locality. What is the time of planting and method of culture? Would it be advisable to try them extensively?—E. R. L., Ripon.

Lentils are a kind of pea which Americans have little use for and our seedsmen do not usually find it desirable to offer the seeds, which indicates a minimum demand. They are grown just like a dwarf pea, for they do not climb. They have a pea's endurance of frost and you can plant them now in drills for cultivation like peas—if you have the seed. The lentil may offend American ideas of efficiency because it only has one or two peas in the pod. It is like the garbanzo in that kind of shiftlessness. Americans like peas which put 8 or 10 peas in a pod and make the pod big enough to grab easily. Besides, the lentil is not eaten as we eat peas: it is used only in stews and soups and for that purpose we use "split peas," which are cheaper because more easily secured in quantity and suit our taste just as well. You certainly should not undertake lentils extensively unless you can get a contract with a buyer who has a good European appetite.

Pineapples in Stanislaus.

To the Editor: I have been wondering if it is possible to grow pineapples in this valley. Some years ago I was in Grahamstown, Cape Colony, and there I saw acres of this fruit growing. The

rainfall was about 15 to 20 inches and just as warm as here.—T. W. M., Modesto.

You surely can, if you will build a lath house for half shade, surround it with a low wind-break of evergreen shrubs, to exclude dry hot wind, and sprinkle frequently to increase atmospheric moisture in very dry times; or you could arrange so that your buildings and fences would give such protection—rigging an overhead shelter against frost during the winter. Such a little undertaking might interest and please you very much, but there would be no money in pineapples thus grown. No matter how well you might succeed, it is too easy to get pineapples from places where moist, frostless air prevails naturally. Commercially it is a forbidden fruit for California, though we have seen an acre of them growing in this State.

Fertilizing Strawberries.

To the Editor: What is the best fertilizer and method of applying it to my bearing strawberry plants? The soil is Pinole gravelly loam, and stable manure is not available. The climate is favorable and I get good crops, but not large paying ones, the soil not being sufficiently fertile. This is especially true of the fall bearers. I irrigate and cultivate well, and would get paid well if I knew how to fertilize well.—E. P., Ukiah.

If the plants are growing vigorously, that is, making good leaves (according to the habit of the variety), fruiting can be promoted by using superphosphate at 200 lbs., and muriate of potash 100 lbs. to the acre. As potash is shy now free scattering of wood ashes will take its place. As you are probably scant of nitrogen, 100 lbs. nitrate of soda per acre is also promising. Apply the superphosphate and ashes now and the nitrate after the early blooming. Scatter well to get even distribution over the ground, not too near to the roots.

Seed Corn

To the Editor: I expect to plant sweet corn and field corn (yellow dent) on river bottom land. Which will be better to plant, home-grown or Eastern seed? How early is it advisable to plant?—W. A. F., Oakdale.

Plant the best, well developed and matured, home-grown seed you can get. It is pretty well settled now that (except for the sake of trying new varieties) the best seed is that which is well grown and selected from plants grown in the locality and which demonstrate by their success their adaptation to local conditions. Plant when your situation is free from frost. There are local variations on that point, but it is usually about May 1, except in low frosty places.

Grafting-Over or Re-planting.

To the Editor: I have about 15 acres of wine grapes about 12 years old which I am thinking of grafting to Thompson Seedless. Would you advise grafting or replacing with young vines?—H. L., Live Oak.

Vine grafting is a very simple operation if done in the sawn-off stump below the ground surface. There are many good transformed vineyards in the State. Whether you should trust to grafting-over depends upon how thrifty, healthy and strong-growing the variety is which you have and how good a grafter you employ or how good a mechanic you are yourself. You must decide advisability for yourself.

Alfalfa Roots.

To the Editor: In following an alfalfa field with vines the plowed-up alfalfa roots are somewhat troublesome in cultivating the vines. If plowed and cultivated under, have they enough fertility to pay for the trouble, or would you advise raking them up and hauling them off?—E. B. M., Fresno.

They certainly are good for the soil. We should chop them up with a sharp disk and work them in. It will also cost less than to gather them up.

Caterpillars and Crane Flies.

In our last issue the printers mixed up our "black spiny caterpillars" and our "Crane-fly larvae" so that the reader could not apply proper treatment to the former. All of the paragraph under the Crane-fly heading from the line "colonies as they hatch," etc., belongs to the black spiny caterpillar prescription—and we would like to apply the same lead-arsenate treatment also to a few black, spiny printers!

Spring Work on Grapes.

[Written for Pacific Rural Press.]

De Lano Bros. of Fresno county got results from good cultural practices on Thompsons and Malagas. When seen late last August, they had been picking over 25 pounds green per vine from Thompson Seedless set out in January, 1913, on 7½ acres. Of this, about 23 tons were sold green at \$40 per ton. One-third were being left for raisins because the price for green fruit dropped.

The Malagas on six acres of 9-year vines were expected to yield 80 tons this year. The yield was 60 tons in 1915 and 74½ tons in 1914.

Principal points in the De Lano grape culture are to let the ground dry as much as it will in spring until forms of bunches appear. Weeds are hoed or shoveled away from vines and basins dug around the trunks. Then plow to cut surface roots and reduce sap flow until grapes are set. In 1916, plowing started the first week in April. They plow about 8 inches deep. Two rounds are first made with a 5-inch single plow away from the vines.

After the plowing, the ground is harrowed and worked down to hold moisture until the June irrigation. This is generally applied by running levees through alternate rows both ways and flooding the checks. Then a single plow knocks down the levees and the ground is plowed toward the vines not nearly so deep as the first plowing. Then it is cultivated both ways as close as possible to the vines. The mulch thus made usually dries out as deep as the second plowing, but keeps the ground moist below that.

Very seldom do the De Lanos irrigate twice. An irrigation in October, 1913, did not seem to show results. Water is withheld until June; and this year another irrigation was given in July. At the July irrigation, a furrow through each center was filled, and when it had settled away it was filled again. The soil is not heavy. A layer of the subsoil is clayey but grape roots go through it.

Sulphuring with resublimed sulphur is insisted upon from the time the first leaves start, as long as there is any danger of mildew. Only two or three vines showed the disease this year in the form of "measles" on the fruit. When "forms of bunches" have appeared, the De Lanos pinch off the shoot, beyond the bunch. This year it was during the second week in April. The object of this is to divert sap flow into the bunches and enlarge the sap channels and stems while they are yet soft. That Mr. De Lano does not see any marked difference in size of stems whether pinched at this time or not, may probably be due to his plowing just before pinching, as the sap flow is thus cut off. Mr. Henry, under whose direction the work was done last year and this, advises delay of plowing until the bunches bloom. The pinching cost \$6 an acre at \$2 per day on the Malagas, including the pulling out of unproductive shoots.

No fertilizer is given except manure and cover crop. They get over the whole place with manure about once in five years but irregularly. The cover crop is mostly barley, but could as well be a legume.

Prune Grower Balks Peach Borers.

[Written for Pacific Rural Press.]

Peach borers do not damage prune trees if they are kept away from them. That is not so hard, for they generally enter the tree at the ground. W. H. Stuart of Santa Clara county uses his spray materials successfully. Right after the heavy rains are over in spring, he slakes a barrel of lime in hot water. As soon as it is thoroughly slaked he pours five gallons of crude oil slowly into it, stirring to emulsify the oil.

He digs dirt away from the crown as if he were going after borers, and applies the mixture with a brush like whitewash from some inches below ground to nearly a foot above ground. Then he banks fine dirt tight against the tree and packs it. When the larvae hatch and drop to the ground, they roll away from the tree; and if they come back, can seldom find anything to push against

while starting their holes. The dirt should be packed a second time in spring to keep worms from any cracks whence they might work on the tree. This makes a double insurance against the pest.

The man with the drag barked about 40 of C. J. Oswald's fruit trees in Kern county. To prevent infection with crown gall and other possible diseases or pests, he daubed each wound with varnish last spring. This is still protecting whatever wounds are not already healed over.

Olive trees are much used as windbreaks for citrus orchards in Tulare county. They are a great protection and are making the road borders attractive as well as profitable. Missions and Manzanillos are generally preferred.

Sticky Whitewash for Orchard Trees.

[Paste this in your hat.]

To the Editor: Please give a formula for whitewash that will stick.—D. H., Stockton; A. W. B., Sebastopol; G. E. R., Reedley, et al.

[Answered by J. B. Hurdley, Yucimpa.]

The formula for whitewash which we find most satisfactory is as follows: One-half bushel of lime, slaked in boiling water; one peck of salt, dissolved in warm water; three pounds of ground rice, boiled to a thin paste; one-half pound of Spanish whiting; one pound pure glue, dissolved in hot water. To this add five gallons of hot water and let stand a few days. This gives a whitewash which will remain on the trees an entire season.

TALKS ON Nitrogenous Fertilization

Number 11

WHAT do you pay for in a ton of fertilizer? Plant-food, of course! But your fertilizer is not all plant-food, by any means. It contains other substances which necessarily enter into the chemicals and mixtures. Actual plant-food is indicated by the guaranteed analysis, and the fertilizer that carries more of the plant-food your soil needs is the best one for you to use.

SULPHATE OF AMMONIA

In buying Sulphate of Ammonia you pay for nitrogen, about the most essential plant-food in California soils, true enough; *but*, in a ton of Sulphate of Ammonia you buy *more* nitrogen—*more* pounds of active, available, lasting plant-food—than you can buy in a ton of any other nitrogenous fertilizer.

That means that each pound of plant-food in Sulphate of Ammonia receives the *lowest* charge for cost of production, transportation, handling, storing, and distribution on the farm.

Sulphate of Ammonia, because of its reliable, uniform composition, its superior mechanical condition and its easy distribution, is the simplest of fertilizers to handle on the farm.

In field and orchard, on lawn or meadow, for truck and garden crops, applications of from 100 to 300 pounds per acre give splendid returns.

Blight-Resistant Pear Stock.

To the Editor: In regard to the Chinese sand pear (*Pyrus calleryana*) as a blight-resistant stock, what results have been obtained by Prof. Reimer of the Southern Oregon Experiment Station.—R. G. R., Sacramento.

[Answered by Prof. F. C. Reimer, Tallent, Ore.]

While we regard *Pyrus calleryana* as a very promising new stock for pears our work with it has not yet

reached a point where we can recommend it for extensive commercial planting. It is true that we regard it as very promising, but as yet we haven't sufficient proof to say that it is a desirable and congenial stock for Bartlett and other varieties. In grafting and budding it unites readily with our cultivated varieties, and the young trees grow well, but it still remains to be determined whether the union will be permanently congenial and satisfactory. We are now testing it in this manner.

The type from southern China, which is growing at Oroville, and also near Sacramento, Cal., should be planted only in mild climates, as it appears to be tender in cold regions. The type of this species from Central China can be grown in much colder climates.

The only trees of this species in bearing in America, so far as I am aware, are those belonging to Mrs. L. Williams, Oroville, Cal., and to R. D. Stephens, Mayhews, Cal.

MUSCAT CROPS INCREASED BY LESS CULTIVATION.

[Written for Pacific Rural Press.]

That seemingly shiftless cultivation is the only way to get a crop of grapes in some cases seems shown by Chas. Westrup's Muscat vineyard in Fresno county. From 88 acres of 8-year vines, on well-drained soil, he took 16,000 trays in 1915. In 1916 he rented 20 acres to his son and from the remaining 68 acres took 35,000 trays, according to Frank Henry, whose directions were followed in 1916.

One block of 980 vines never had a crop before, but produced 2113 trays this season. The soil was "too fertile"; and with ordinary cultivation forced so much wood growth that grapes didn't set. All the cultivation this block got this season was a plowing with four horses on a 2-gang plow after the ground had dried out. Then a cultivator was used in one direction and a rotary harrow cross-wise. Lack of further cultivation directed the vines' energies from wood growth into fruit production.

Comparison.—The shoots were pinched as noted in other articles, to get an early setting of the second crop on the whole piece. On the 20 acres operated by the son, the vines were summer-pruned and treated as previously. He lost his second crop and got 9000 trays from the 20 acres. His crop was 450 trays per acre, while that from the remaining 68 acres averaged close to 515 trays.

TRAGEDIES WITH CLYMAN'S.

To the Editor: Referring to the inquiry about Tragedy prunes. They bear well if mixed with Clyman plums.

T. J. True.

Lancaster.

This is an oft-tried combination, but it does not seem to have worked everywhere that both varieties have been tried. Some more of our readers might tell how they made Tragedies bear where they had not previously.

A shipment of Watsonville Newtown Pippins sold recently in London at \$4.45 per box or \$2.50 f. o. b. Watsonville.

Oranges

Lemons

Grapefruit

Avocados

WE HAVE a splendid stock of well-rooted, properly grown citrus trees. Planters will find it greatly to their advantage to buy from a large nursery like ours, where the best methods are employed in growing trees.

There is a strong demand for California citrus fruits. Large national advertising and improved growing methods have greatly enhanced the value of this industry. If you have suitable land with water, there is no crop that will return so large a revenue per acre as the citrus crop.

Orders for any considerable number of citrus trees received from all points in Southern California will be filled from our nurseries at La Habra, Orange County, which will mean a saving in both time and freight.

Spray Early for Citrus Red Spider.

[Written for Pacific Rural Press.]

Kill the first few red spiders on citrus trees and then they can't lay eggs which would require another spraying when they hatch, is the advice of Mr. Griffin, until recently of the Leffingwell Ranch in Los Angeles county. During the eight or nine years Mr. Griffin was on the Leffingwell Ranch, he neglected his own; and red spider put them into a sick condition, yellowing the leaves and causing many to drop. His home orchards were sprayed thoroughly with lime-sulphur last fall; and when seen this spring by our representative, he was among the trees keeping a personal lookout for red spider or any-

thing else that might come along. The spray was still plentiful on the old leaves; but since the spiders prefer new growth, that must be watched especially.

"Spray any season when you find them," says he, "using lime-sulphur 1 to 25 in early spring when trees are most dormant, and as weak as 1 to 60 when there is much tender growth and warm dry weather to follow. You must consider condition of trees and weather; and be careful." One spring Mr. Griffin used 1 to 25 just before a warm, drying windstorm; and it burnt badly.

Lime-sulphur is considered much better than dry sulphur, and more effective in cool weather though not when temperature is high enough to vaporize the sulphur well. Dry sulphur on the trees is knocked off by the work stock in cultivating. It irritates the eyes of men and beasts, having, at least temporarily, blinded several mules on this ranch. Soluble sulphur was not mentioned by Mr. Griffin, but Deputy Horticultural Commissioner B. R. Jones of Los Angeles county says that lime sulphur is still in the lead for all around effectiveness; and he also urges growers to spray before injury is noticed and before the first-appearing red spiders have a chance to lay eggs. "Each of these will produce many more; and prevention is always better than cure. The lime-sulphur should be used at a strength of 2½ to 3 per cent for a 30 degree Baume product."

TREAT THE APHIS EARLY.

[By Deputy Horticultural Commissioner B. R. Jones, Los Angeles.]

Every grower of peas, beans, cabbages, cucumbers, melons and other plants likely to be troubled with aphids in any form, should watch them very carefully and at the very first appearance of the insects, give treatment at once. (1) Because the plants are then small, making treatment easier; (2) because if you wait until damage is done to the plants, the insects will have become so numerous that the constant hatching will result in the destruction of the plants notwithstanding treatment thoroughly given. Probably strong soapsuds containing one part to 400 of "40 per cent nicotine sulphate" or "Black Leaf 40" is the best treatment, taking care to apply it to the under sides of the leaves in particular.

Tree Aphids.—This is also as good a spray as any for the black aphids on peach trees which sometimes are so numerous as to make the young leaves die and turn brown. About the same amount of the spray liquid as has been used on the top of the tree should be soaked into the ground about its roots, as in the case of the woolly aphids on apples and pears, to insure good control of the lice. For woolly aphids, the spraying must be very thorough and repeated when necessary, and wood ashes, blue stone, or tobacco stems or dust on the soil about the tree are a help. In few cases only are these two kinds of tree lice destroyed; but if they are given thorough treatment they will become much less injurious.

Lady Bugs.—The common native lady bugs help in controlling all kinds of aphids and they should never be destroyed, either in adult form or while in the form of a dark-colored, bristly larva, three-quarters of an inch long, pointed at both ends with a couple of square yellow or red spots on each side of the back near the middle. These queer-looking creatures are very frequently not recognized as the larva form of this insect. However, the main point in

controlling the aphids is early treatment before they become too numerous and the plants and trees are weakened by their work.

The Tulare County Canning Peach Growers' Ass'n has decided to operate again. They sold over 4,000 tons last year to a Pasadena cannery because local canners would not come up to their prices. Only one or two eligible peach growers in the county have not signed up.

TREE SPRAYS

Whether or not your crop will pay for the labor and outlay largely depends on the care of the trees and the spraying. These depend on the quality of the materials used in compounding the remedies and sprays.

Scientific preparation, backed by the name, insure you the quality of

Growing Phenomenal Berries.

[Written for Pacific Rural Press.]

From 13 Phenomenal berry plants, R. S. Weaver of Merced county didn't get enough berries for family use two years ago because he neglected watering. He didn't get many berries last year either, because of the underdevelopment due to the preceding drouth. But the next neighbors got all they could use and then some from a similar row of Phenomenals planted on a field ditch and trained to the fence. The ditch contained water most of the time when the main canal had some. Seeing this, Mr. Weaver watered liberally last summer, beginning soon as they needed it and continuing irrigation weekly through the bearing period. There is every prospect of a big crop this season, for canes grew last year up to 20 feet long, making big long laterals from every joint near the base late in the season.

Pruning.—New growth is allowed to run on the ground all summer while last year's wood on a trellis is bearing a crop. The new growth is not much in the way, for its laterals do not develop till picking is done. After bearing is over, any time up to the next spring, the canes which bore this year are cut en masse from their low trellis of two small wires side by side and perhaps a foot apart. Then the past year's growth is easily twisted around the wires like Loganberries. By growing on the ground many have rooted at their tips, supplying plants to sell or increase the patch.

Phenomenal berries are Burbank hybrids of blackberries and red raspberries, similar to Loganberries, but, according to Mr. Weaver, larger and better. They are best planted about 10 feet apart in rows about six feet

apart. Fruit buds show in clusters when shoots from leaf axils of both the main canes of last year's growth, and their laterals, are a few inches long, as noted by Mr. Weaver. Some developed more slowly than others, so the ripening season was several weeks long.

FEEDING CITRUS TREES FROM MANGERS.

(Continued from first page.)

Previous to the basing, the grove had been irrigated by furrows straight down the rows, so the ground between the trees did not get wet enough to allow roots to grow there. When the basins were made between the trees and only as wide as their diameter, water was run into the basins, but there were no roots to use it. The feeders between the rows died slowly for lack of water; and for a month or more the proprietors became alarmed; for the trees looked very sick. But as soon as new roots became established in the basins, tree growth "shot ahead" with healthy color.

Unless future years reveal unexpected objections, one or the other sort of basins is considered permanent on all the trees of the National Orange Co.

EXCESS SAP AND ALMOND DROP.

You who have almonds on sub-irrigated lands can save a part of your crop by cutting off the ends of the limbs just when, or before, the trees begin to cast their nuts, and as fast as these limbs begin to dry or heal, cut off more limbs, or more off the same ones, so as to keep the overflow of sap escaping until the nuts quit falling, writes M. L. Porter in Modesto Herald.

This will save you part of your crop and is the best you can do except to graft your almond trees to peaches or other fruit that will stand more water than almonds.

Fine Crop of Short Staple Cotton.

[Written for Pacific Rural Press.]

From 35 acres of Mebane cotton, Lee Benge of western Imperial county made 38 bales last season, some of it yielding $1\frac{1}{2}$ bales per acre. While it was growing, there were six weeks when it needed water but didn't get it. The land had not been plowed for four years of cotton cropping. Part of the rows were eight feet apart. It was planted dry early in April, because Mr. Benge was at other work. He believes the crop would have averaged $1\frac{1}{4}$ bales if he had plowed the ground. He believes there would have been three bales more on the piece if he had double listed. He made $\frac{1}{2}$ bale more per acre the year before on similar land planted late in February than on some planted in May. There are usually two weeks of warm quiet weather late in February and early in March. If cotton is planted then, the best crop will be gathered, says Mr. Benge after two years of experience and close observation of neighbors' crops. But good results follow planting even as late as June 1. March and May are the best months to plant according to Horticultural Commissioner F. W. Waite.

Planting dry is a mistake also, thinks Mr. Benge; for he has noticed that everyone who irrigates before planting gets a good stand, other conditions being favorable. His land is a medium hard soil with more sand than extra hard land, making it less sticky.

How the Crop Was Made.—Last season a rolling stalk cutter was run over the field. Then it was listed and about 15 pounds of selected seed planted per acre, using a two-row corn planter and plates with holes about the size of a dime. These drop three to five seed at a time on tops of the ridges. It is better now to use extra seed than to take chances on a poor stand.

The seed comes up in four to eight days, depending on weather and moisture, though it can be made to come up in two days by rolling it in wet ashes and allowing it to absorb warm moisture awhile before planting.

As soon as it is up it is harrowed crosswise of the rows with two horses and a three-section tooth harrow. This breaks any crust, kills weeds, and smooths ridges so they won't dry so soon. Part of Mr. Benge's was harrowed twice where the weeds were worst and the cotton thickest. He got a better stand there than elsewhere; though the harrow knocked down many plants and seemed to be killing them. They would straighten up in an hour, however. To get the roots deep away from summer heat and dryness, irrigation was withheld until the leaf edges curled and parched slightly.

As soon as possible after the plants came up, a shovel cultivator stirred the soil except a strip three inches wide in the rows, using a slow team to avoid covering the plants.

Plants are chopped out to 24 to 30 inches apart on rich ground; because if too thick, they grow spindly and bear a small crop in the tops where it is hard to pick. On poor ground they are left 10 to 14 inches

apart. Many of the stalks fall over at the chopping, but straighten up in a few days. As soon as they are standing nicely, they are cultivated, throwing dirt toward the rows.

February-planted cotton makes its first crop of as many as 40 or 50 "squares" late in April; and if not allowed to get too dry, these produce blossoms and cotton. From the first irrigation until October, "hard" land should be irrigated every ten or twelve days as the irrigation is practiced, for it does not take much water each time. Soft land does not require it so frequently, especially if well cultivated. Irrigation is run through the furrow between each two rows, aiming to run it only half way up on the sides, which is difficult where the ground has not been thoroughly leveled. It should be held until it has soaked through the ridges, though perhaps not till it has wet the tops of them.

Lots of people do not cultivate after each irrigation; but Mr. Benge does, and it was only by frequent cultivation that he brought it so well through the six weeks of water shortage last summer.

As against the good crop of high-priced cotton produced by this extra care Mr. Benge bought a crop of 35 or 40 acres on the stalks, which had been planted June 10 and poorly cared for. It yielded $\frac{1}{2}$ bale per acre.

BEANS AT LIVE OAK.

In answer to J. V. S.'s (Lodi) question in your issue of Feb. 17: From my experience here at Live Oak, blackeye would be my first choice, pinks next. The large whites are most successfully grown (as you say) on moist river bottom soils, which is natural bean soil. Here we are under irrigation, which gives us unnatural moisture.

One of the most successful crops grown in this section was planted with best results June 15 to 25. Our experience has taught us that by planting between those dates, or thereabout, there is practically no danger of red spider (which, by the way, I think is the bean bug our friend has in mind). If there are no red spiders in his territory he would likely get results planting large whites the last of March or first of April. If his soil will hold moisture enough to sprout his beans, would much prefer the month of May.

C. Frank Westlake.

Live Oak.

According to Horticultural Commissioner Harney of Yuba county all of the available bottom land on the east side of the Feather river, both north and south of Marysville, has been leased for bean culture the coming season. He estimates that there will be 1,000 acres more beans than usual in that district. He also states that practically all of the Sutter Basin will be planted to beans and that the Durst Hop Co. are planting fully a third of their hop land to beans besides a large acreage which they have rented.

Fundamentals of Agricultural Economics.

[By Thomas Forsyth Hunt, Dean of College of Agriculture, Univ. of California.]

The value of an industry to a community or to society is not wholly dependent upon the capital earned upon the investment, but in large part depends upon the labor return obtained by those who actually occupy the land, whether as owners, tenants, or laborers. It is absolutely essential to the permanence of our political and social ideals that the man who actually occupies the land, whether he owns it or not, shall receive such income for his labor as will enable him to rear and educate a self-respecting family.

No one doubts the importance of ability in any occupation. Some may not, however, understand its significance when applied to farming. Farm records have been compiled in many parts of the United States. They show that in a great many of these regions, one-fifth of the farmers have a labor income of \$800 to \$2000 more than the average of the particular locality. The average labor income for a particular locality rarely falls below \$300 or rarely rises above \$500 per year. The labor income of the upper one-fifth lies somewhere between \$1100 and \$2500. This is only another way of saying that the labor income is three to five times as great among the upper one-fifth as it is for the average farmer.

In the very nature of the case, farming being operated upon an openly competitive basis can only return on an average a moderate wage plus the current rate of interest for high-grade securities, which is always a low rate of interest. It is a fundamental law of business that the better the security, the lower the rate of interest. As Ambassador Herrick says: "Mansions may become boarding-houses, factories may become fit for nothing; but good fertile land will have a value as long as civilization lasts."

A distinction must be made between the security the land affords and the security which improvements offer. The world over, land is capitalized at not far from a 3% basis. The capitalization of the improvements, and therefore, the farm as a whole, will vary with the nature of the improvements. If, for example, a man has improved his farm with a peach orchard, the productive life of which is, say, fifteen years, he should not only receive interest on the capital, but he should receive in addition an annuity which will amortize within fifteen years the principal invested.

Every Farmer Should be above the Average. — Dean Hunt presented tables of figures tending to show that in any neighborhood yields three to four times the average are to be expected on particular farms and under special conditions. It was laid down as a general rule that a qualified farmer should expect to produce a yield 50 per cent greater than the average farmer, but that a man who bought a property on the basis of exceptional yields is generally destined to failure. For successful farming, Columella says there are three conditions necessary: knowledge, capital, and a fondness for the pursuit.

In 1910 the average value of a

farm property in the United States was between \$6000 and \$7000; in California it was between \$18,000 and \$19,000. Arbitrarily using as a basis of discussion a gross income of \$4000 per year, it was shown that the average farmer would require a capital of \$25,000. Assuming, however, that no man should engage in farming unless he is 50 per cent above the average, a capital of \$16,000 would be required.

It was shown that only a portion of the \$16,000 should be spent for unimproved land, say, not to exceed \$6000. The \$4000 gross income may be divided roughly into ex-

MADEWELL SURFACE PIPE
ROBINSON HARDWARE CO.
GILROY, CAL.

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook. The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

The Only Car That Does Those Things Is Hudson Super-Six

The Super-Six is the only car that ever went 1819 miles in 24 hours.

It is the only car that ever went from San Francisco to New York and back in 10 days and 21 hours. In that one round trip it twice broke the ocean-to-ocean record.

At Pike's Peak, a Super-Six Special defeated 20 great rivals, all specially built for hill climbing. It made the best time in the world's greatest hill-climb.

It holds all the speed records for stock touring cars, and the records for quick acceleration.

Note What That Means

You say you don't want a racing car. We know you don't. You will never, perhaps, use half the power or speed of the Super-Six.

But mark that this motor is a small, light, simple Six. We have added no size or cylinders. We have taken a light Six and, by this invention, increased its efficiency 80 per cent. And solely by reducing friction, which destroys the motor and wastes its power.

We Did Just This

The Six-type motor had great limitations. Despite all perfections, much vibration still remained. And vibration causes friction.

Some engineers, including the Hudson, were testing Eights and Twelves. They felt that twin-type motors might solve the friction problem. The trend was away from Sixes.

Then Hudson engineers brought out this Super-Six invention. It is a Hudson invention, patented by Hudson. In this new-type Six they obtained all the efficiency and endur-

ance sought for in the multi-cylinder type and they did this without adding cylinders, complications or weight.

All in Endurance

All the Super-Six records—for speed, hill-climbing and long-distance—were won by this motor's endurance. They mean that motor wear and friction are reduced to almost nothing.

By excelling in these feats, it proved that this motor will outlast any other type.

That is what you want above everything else. You want less wasted power, less wear, less friction. That means, of course, supreme performance. But it also means supreme economy.

What You Can't Afford

Some men will say, "I can't afford a superb car like the Hudson."

But you can. All this beauty, luxury and superlative performance will cost you less than many a car without them.

The Super-Six invention, in all probability, doubles the life of a motor. It saves the power which was wasted in friction. And this year we add a new gasoline saver which saves a great deal more.

No other fine car gives such value as the Hudson. No other car has a motor which compares with this. A higher-quality car is impossible. Yet note how far the Hudson undersells many cars that it out-performs.

Go see and prove this car. It is now the largest-selling car above \$1200. And the saving shows in the Hudson price.

HUDSON MOTOR CAR COMPANY, DETROIT, MICHIGAN

penses, \$2080; interest at 5 per cent on \$16,000, \$800, and labor income \$1120. It was pointed out that if this farmer was paying interest at the rate of 8 per cent, his labor income would only be \$640. If on the other hand, a man owns a farm, on which he intends to raise a family, he may be content with 3 per cent interest on his investment; hence will receive a labor income of 9 per cent of \$1440 per year. If, in addition, the farmer has children who enable him to do his work within the family, his outside expenses may be reduced and his family income thereby increased.

The important fact with reference to these children is not the money they earn; but it is that the training which they get in contributing to the family income is of the utmost importance to society.

Renters and Debtors Need Larger Farms.—Dean Hunt repeatedly stated that the figures given should not be taken literally, but as illustrating the method to be employed in arriving at a probable income. If a man must go in debt for a farm, he needs a larger income than if he has the money to pay for it, an economic principle which is constantly being ignored in agriculture. In like manner, a renter needs a larger farm because he must not only make a living for his own family, but he must in whole or in part make a living for the family of the land owner. In 1910 the average size of a farm in California operated by the owner was 227 acres; that by tenants was 342 acres.

Can a Living Be Made on One Acre?—The answer is that if a labor income, such as has just been discussed, was earned from one acre, it would be worth at least \$16,000. Paying \$1000 for an acre that is dear at \$50, does not qualify it to produce a gross income of \$4000. While not denying the possibility of producing \$4000 worth of products from an acre of land, it is necessary, strange as it may seem, to state the simple fact that ordinary mortals seldom do it. It is not the number of acres a man owns, but it is the total gross income which the property is capable of producing which determines whether it is possible to make a living on it.

GRASS FOR COAST RANGE.

To the Editor: What kind of grass should we use to seed mountain ranges in this section? They are getting so they don't produce much. We have rains until June.—H. L. H., Potter Valley, Mendocino county.
[Answered by Prof. P. B. Kennedy, University of California.]

The grass that your correspondent would be able to grow in Potter Valley would depend upon the exposure, slope, shade conditions, and character of soil. Under the trees, and particularly where the land may have been burnt over, orchard grass usually makes a good growth if planted in the fall before the rains. English perennial rye grass, Italian rye grass, and crested dogstail will also make a fair growth under the same conditions. Velvet grass is of some value as a rough feed and withstands a great deal of drouth and makes fair feed early in the spring, but later if it gets old, is not very palatable.

Along gravelly creek banks, where

there is some seepage moisture in winter, and perhaps very little during the summer, a considerable amount of sweet clover may be raised by simply scattering the seed on the land.

It is difficult on the loamy soils that lose their moisture very rapidly, to get anything but the native species to grow, and these have been very largely eaten out and replaced by worthless weedy species. We have not yet found a grass that will meet the requirements under these conditions. The grass must be so aggressive as to come into strong competition with weedy species already present as well as have great drouth-resistant qualities to enable it to endure the long period of drouth with little or no moisture in the soil.

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near \$2 a bushel offers great profit to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE

and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of Oats, Barley and Flax. Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Gilbert Roche, Canadian Government
Exhibit, San Diego, Cal. Canadian Gov't Agt.

"Best in the Long Run"

Corn Yields \$90 Per Acre.

[Written for Pacific Rural Press.]

Whether California is a corn State or not, a \$90 an acre crop is not to be sneezed at, and that is what O. C. Kiefer of Butte county realized on old alfalfa land last year. During the winter Mr. Kiefer plowed up an old alfalfa field that was pretty badly run out. The land had been poorly leveled the first time for irrigation, so it was carefully gone over with scraper, and by April was ready for another good deep plowing. That time it was plowed an average of 13 inches deep. Planting was done the early part of May with a corn planter, Orange County Prolific seed being used. As soon as the rows could be distinguished, it was cultivated with a disk cultivator, and during the season it was treated in the same manner five or six times. Besides the cultivations it was irri-

gated twice, the last time when it was tasseling out. When harvested about the first of November, it yielded an average of 3600 pounds of shelled corn, which sold for \$2.50 a hundred or \$90 an acre. But in his location corn does not do well on land that has not previously been in alfalfa, attempts of his father on such land showing comparatively poor results.

It may also be of interest to silo owners to know that corn planted and cared for as Mr. Kiefer cared for the above made better silage on adjoining places than corn that was grown after a crop of grain hay. This is explained by the fact that the later-planted corn did not have so much time to mature; and as a result carried a smaller percentage of grain.

ALFALFA

250 lbs. of Mococho Superphosphate per acre will increase the yield of alfalfa enormously. "In some cases the alfalfa growth has been tripled," writes Mr. F. F. Lyons, San Joaquin Co. Farm Adviser. Write for particulars. THE MOUNTAIN COPPER CO. 332 Pine Street, San Francisco.

FREE PLANS FOR FARM BUILDINGS.

Hereafter any farmer who has farm buildings to build can obtain typical plans of such structures from the University of California, without cost. Through this free distribution of typical plans for farm structures, the farmers of California will be able to make use of the best modern ideas of architects, engineers, and agricultural experts as to how to design farm structures so as to get the best possible returns in the way of service, sanitation, and satisfaction.

For a year and a half the problem of preparing plans for farm structures especially suitable to California conditions has engaged the attention of the Division of Agricultural Engineering of the College of Agriculture. Now plans are ready for free distribution for dairy, hay, and utility barns; milk-houses, hog-houses, and chicken-houses; silos, septic tanks, feeding appliances, and various other farm structures.

Any farmer who is planning any building work on his farm should write to the Agricultural Extension Division, at Berkeley, and ask for a complete list of available plans and how he can borrow them. The importance to the prosperity of California of this very practical new activity of the University is shown by the fact that ten million dollars is spent every year by the farmers of California on farm structures, and yet extremely few California farmers have in the past had the advantage of architectural and engineering advice from experts in farm architecture and farm engineering.

CONVENIENT ONION CULTIVATION.

[Written for Pacific Rural Press.]

An Italian onion grower near Merced economizes cultivation labor by a clever scheme. Ridges are thrown up with centers two feet apart. The seedlings are laid against one side of each ridge about three inches apart and with the root crown about half way up the side. Dirt is raked from the furrow to cover the seedling roots and this makes a narrow trench from which water readily "subs" to the plants. Then a little more dirt is raked from the near side of the adjoining ridge to cover the onions deeper as they grow, and prevent the 'dobe soil from baking.

DO YOU LIKE WILD MUSTARD?

Wild mustard can be controlled, according to State Horticultural Commissioner G. H. Hecke, by use of iron sulphate at rate of 100 pounds to 52 gallons of water, application to be made when weeds are about six inches high. A spray pump of at least 150 pounds pressure should be used with a set of nozzles arranged like a potato sprayer, throwing a fine penetrating spray. This spray will do but slight damage to growing grain. The mustard soon withers, leaving the space it occupied to be filled by growing grain, thus increasing the crop, consequently the yield, with a corresponding net increase to the farmer.

Much rice has been bought in Butte county for shipment to the Allies via Galveston.

JOHN DEERE IMPLEMENTS

The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

[The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.

John Deere Spreader

The Spreader with the Beater on the Axle

Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric drive—a new and exclusive driving device. Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.

New Deere Light Draft Gang Plow

For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.

The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

John Deere Quick Detachable Shares—great labor and time savers. Shares can be taken off easily, only one nut to remove.

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Teeth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-152.

JOHN DEERE, MOLINE, ILL.

John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs. Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Harvesting Machinery

John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

The John Deere Grain Binder has wide and high bull wheel—great power. Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horses and makes square corners and full swaths possible.

John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory.

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

John Deere-Syracuse Sloping Landside Chilled Plows are unsurpassed for general purpose work in light soils. They leave a clean, open furrow bottom.

Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—noted for satisfactory scouring qualities, strength and uniformity. Right and left hand styles.

JOHN DEERE, MOLINE, ILLINOIS

PROOF that Blasting the soil pays fruit growers

EVIDENCE

"In preparing the ground for the planting of trees the *Rural Press* recommends the use of powder." PACIFIC RURAL PRESS, San Francisco.

"We advocate the use of explosives for loosening up compact soils and hardpan in tree planting, knowing the value of such work." FANCHER CREEK NURSERIES, Fresno, Cal.

"The use of a good explosive is of great benefit in planting an orchard, as the ground should be loose enough to allow roots to go to their natural depth easily." BENEDICT NURSERY CO., Portland, Ore.

"We favor blasting holes for trees where the soil is heavy. Powder will loosen the soil, giving it a better chance to become aerated, as well as making it more retentive of moisture." OREGON NURSERY CO., Orono, Ore.

"My orchard has made excellent growth, due to the fact that I used dynamite, breaking up the soil and making excellent beds for the roots. If I were to set another orchard I would not think of doing so without blasting each tree hole." T. A. JOHNSON, Boise, Idaho.

"We have used explosives in digging tree holes in the hard caliche subsurface layers which occur here. We find this cheaper than the use of pick and crowbar, and more satisfactory in that the soil is shattered deeper than the hole could be dug." GEORGE T. FREEMAN, Arizona Agricultural Experiment Station, Tucson.

"The use of Farm Powders in the orchard industry is rapidly being learned and appreciated. The worst looking orchard I ever saw, suffering from a lack of drainage, was blasted two or three years ago, and now it looks as fine as any other well kept orchard in this valley." E. H. SHEPARD, Publisher "Better Fruit," Hood River, Ore.

"We have observed many cases in which powder has been used for blasting beds for fruit trees, invariably with great success. The use of explosives is of material benefit when the soil is inclined to be rather shallow and underlain with a hard subsoil. There are few soils in which blasting cannot be done profitably." THE FRUIT GROWER, St. Joseph, Mo.

"I have done a great deal of orchard planting and use powder for making the holes. At first it was used chiefly on heavy hardpan or other soils that were difficult to prepare with the spade, but is now used on all classes of soil. I am planting trees even in light soil, easily handled; I should prepare all the holes with powder. Trees so planted make extraordinary growth." FRANK FEMMONS, Oakhurst, Cal.

"Generally speaking the growth of plants depends upon the condition of the soil into which the roots penetrate. If the depth of loose soil is too limited or the surface water is permitted to stand too long, the growth is impaired. Explosives properly used in such instances have invariably relieved the condition and resulted in excellent growth. The yield is often three times as great on blasted soil as from those untreated in the same vicinity." ROSECROFT NURSERY & FRUIT FARM, Sumner, Wash.

"The O'Connor prune orchard near Los Gatos in the Santa Clara Valley, California, was blasted in 1913. During the previous six years the largest crop was 3,900 pounds. In 1914 after the blasting, the crop was 8,000 pounds, more than double. It was a dry year, too. Where there were from 30 to 40 per cent. of 'drops' in the orchards on both sides, the O'Connor place lost only about 5 per cent. Prunes from the blasted orchard averaged much larger and the trees made a better growth and retained their foliage a month longer than the orchards on either side." JOHN A. GALPIN, Los Angeles, Cal.

"My orchard was planted three years ago and all trees were of even age and size. I intended to blast the whole orchard but ran out of powder and finished the small balance without it. This enabled me to compare the growth of the trees and satisfy myself that the expense was justified. The trees that were planted in blasted ground show a growth of 75 to 100 per cent. over the trees that were planted in ground not blasted. They also appear healthier and more satisfactory in every way. I have just bought 1100 more prune trees and would not think of planting them without preparing the ground with powder." HERMAN H. SMIDT, R. 3, Oregon City, Ore.

is given by many fruit growers in the accompanying page from the Giant book, "Better Orchard Tillage." These men say that blasting

- enables the trees to root deeper;
- adds moisture storage capacity;
- saves labor and money;
- improves orchards that are not doing their best;
- is always profitable when properly done;
- places the soil in the ideal condition that permits newly planted trees to make extraordinary growth;
- increases the yield of fruit.

Scores of the most successful fruit growers in the Pacific Coast States plant all of their trees in beds blasted with one of the

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

—Eureka Stumping Powder or Giant Stumping—both of which are made especially for this and other agricultural work. They have found these Giant Powders particularly well adapted to subsoiling and for blasting tree beds.

Some kinds and grades of explosives tend to shatter and pulverize anything they come in contact with. They act too quickly. These ordinary dynamites do not do the work well and cost more. Eureka Stumping Powder exerts its strength slowly, comparatively speaking. It tends to disrupt, crack, split and heave the soil and it extends its influence over a wide area. It loosens and pulverizes the soil instead of packing it and throwing it high in the air. This is the action that is wanted in soil work and this action the "high percentage" dynamites will not give.

Warning Giant Powder is the trade name of explosives manufactured by the Giant Powder Co., Con. Because Giant Powders are best known everywhere, many have assumed that all high explosives are Giant Powders. Insist upon having the genuine, made only by The Giant Powder Co., Con. If your dealer has only ordinary dynamites, write us and we will see that you are supplied with real Giant Powders.

Try ONE BOX

Perhaps you have never planted trees in blasted beds. To make it easy for you to prove the value of blasting the soil, we print a trial order form in the coupon to the right. Fill it out and we will have our nearest distributor supply you—at the lowest market price—with a 25- or 50-lb. case of either of the Giant Farm Powders. Blast beds for all of your trees. Plant one in a spade-dug hole, the ordinary way. Note the difference in growth.

If you are using explosives for tree-planting, test a case of Giant alongside of the brand you have been using. After blasting with each, take a spade and see how much more thoroughly Giant does the work.

Remember that you can blast whenever the soil is dry, from a day to a year before planting time. Many growers keep Giant Farm Powders always on hand.

Have You Had the Book "Better Orchard Tillage"?

Prepared especially to tell the facts about blasting soils for orchards and in orchards of the West. It tells how to secure the proper sub-irrigation conditions by blasting. It explains how blasting promotes drainage and increases both moisture-storage capacity and fertility. It gives detailed directions for preparing the soil for tree planting or for deep cultivation of established trees. We will send a copy free on request. Tell us about your problems and mark and mail the coupon. Other books on Ditch Blasting, Boulder Blasting, Subsoil Blasting for all farm crops, and Stump Blasting will also be sent on request. Ask for the books that interest you.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

AUTO TRUCK SHOW IN SAN FRANCISCO.

What will probably prove to be the largest motor truck show ever held west of Chicago is the Commercial Motors Show, under the management of Ivan R. Gates, which is scheduled to occupy the Exposition Auditorium, in San Francisco, from April 3 to 7 and which will take up more than 51,000 square feet of floor space available there.

In addition to the many exhibits of the truck builders and dealers will be those of several departments of the United States Government, as well as those of a number of dealers in special equipment. Excursion rates will be advertised by the railroad companies and special efforts will be made to interest and bring prospective motor truck purchasers from remote points, thus allowing them the opportunity to compare the various makes and models best adapted for their needs.

Under the direction of C. R. Thorburn, Secretary of the California Home Industry League, a special and extensive exhibit of trucks built in California will be shown in a separate section. Another exhibit will be that of the War Department, which will show a number of trucks owned and operated by it in the field, and manned by soldiers from the Presidio or from one of the forts. It is planned to have one of the big trucks used in the U. S. Life Saving Service when hauling their

life boats, on exhibition and there will be much of general interest and entertainment.

Practically all of the leading makes of trucks will be represented and liberal space has been taken by those exhibiting them. Among those for which space has been definitely reserved are the International, Mack, Saurer, Stewart, Garford, Little Giant, Autocar, Indiana, Four Wheel Drive, Wichita Sterling, Kelly Springfield, Bethlehem, Kohler, Signal, Vim, Rainier, and Clemens, while in the "Made in California" section will be found the Doane, Moreland, De Martini, Hewitt, Ludlow, Kleiber, and Ralston.

The truck attachments now being introduced for the conversion of Ford and other light cars into efficient and economical one-ton trucks will occupy a prominent position and the exhibits already entered comprise many of the most important, including the Smith Form A truck, Hendricks worm drive, Ames, Huddford, Ralston, Brown and Holohan.

A large number of accessories will be exhibited and demonstrated, including the Champion and Autocraft spark plugs, Master and Miller Carburetors, Johnson Shock Absorbers, Nafra Warning Signal and a large exhibit of the Barnett Auto Body Company, consisting of models of auto bodies. A line of store, warehouse, and mill trucks, electrically and gasoline propelled, will be shown by Wood, Huddard and Brown.

More than seventy exhibits will be shown by more than forty prominent manufacturers, who have already availed themselves of this first opportunity to display their models in competition on the Coast and there are many more applications on file, awaiting assurances that their exhibits will arrive here in time.

READY ON TIME FOR IRRIGATION

[Written for Pacific Rural Press.]

Where irrigation must be used in turn, there is often a great rush to get ready for it, and sometimes loss from not being ready. C. S. Lombard, Jr., of San Bernardino county, who handles 50 acres of oranges and 20 acres of alfalfa under a company pump, is not much worried about the preparation, for he has used a 10-25 tractor over three years and can keep his work up. We found him Feb. 3 cultivating fertilizer into a whole row at once of full-bearing oranges, using a 22-tooth spring barrow with the outside three teeth covered with sheet iron to avoid catching the limbs. The harrow was in three sections; the outside ones being connected to lever appliances with which the driver raised them without getting off the tractor, in making the short turns around tree-row ends.

The tractor is in use an average of one week of every month from February to October; and aside from the breaking of a mainshaft for lack of grease, there has never been any notable trouble, except once. In the summer of the second year, the motor

KILLEFER
EFFICIENCY

KILLEFER
QUALITY

Beet Cultivator

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the strongest and best made Beet Cultivator for sale on the Pacific Coast.

What About Your Irrigation Pipe?

Owing to conditions existing in the iron market and also to weather conditions, we suggest you order early.

AMES IRVIN IRRIGATED PIPE.

We have a complete stock, and can make immediate delivery. AMES IRVIN PIPE is solid and strong, with no holes in steel. Each sheet is edged-locked together, and then set down under 3500 pounds pressure. Such seams will not break or leak. Send for booklet giving complete information about Irrigation Pipe and its construction. Get it today.

AMES IRVIN COMPANY

8th and Irwin Street,

San Francisco

had to be overhauled and the cylinders rebored because so much dust had been drawn through the carbureter that compression was lost, due to scored cylinder walls. Now he has a dust remover.

In winter when not in use the tractor is stored in a shed, where it requires no further attention or expense. The tractor is considered too slow to do any hauling, but alfalfa is cultivated in the spring, using alfalfa points on the springtooth, and a couple sacks of dirt to make them dig deeper.

AUTO ENGINE FOR PUMP.

To the Editor: Do you think the slow-speed, high-power auto gas engine (for instance, Olds 6-cylinder 60) at all suitable for running a 10-inch centrifugal pump on a twenty-foot lift? I can get such an engine cheap, but I want to know if it really is cheap at, say \$150. Would an auto engine do on an 8-inch pump?—C. E. R., Meridian.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

To operate a ten-inch centrifugal single stage pump at a normal speed against a 20-foot head will require in the neighborhood of 35 h.p. To operate an eight-inch pump would require about 25 h.p. The original rating of the auto engine was perhaps based on a piston speed of about 1000 feet per minute. To get satisfactory results as a stationary engine this should be cut down to about 700 feet per minute, reducing the power

of the engine from 60 to about 40 h.p. We do not believe that it would be practicable, even if the engine be in good condition, to ask it to deliver more than 25 h.p. continuously. The success of the use of an old engine of this kind, even though it be a high-class engine, would depend to a large extent upon the skill and ingenuity of the man who will make the installation as well as the condition of the engine. Adequate cooling facilities must be provided and for the best results an automatic governor should be used. We would strongly recommend that if such installation is attempted that the engine not be heavily loaded and that a six-inch pump would be much more apt to be successful than an eight.

POWER NOTES.

The old Samson tractor had a solid tired narrow front wheel. In turning on soft ground with a load behind, there was often not enough grip on the front wheel to overcome the resistance of the load, in turning. More recent models have a sieve grip twice as wide as the old ones.

Notice the force feed of oil to the cylinders, which may be plugged up. This can be seen through the glass with the motor running. "Keep things tight and well oiled, that's all there is to it," says C. S. Lombard, Jr., of San Bernardino county.

The Supreme Tractor for Cultivating

THE

BEAN TrackPULL Six Horse Tractor

Is the Ideal Machine for Cultivating.

Cultivating time is here and every farmer and grower should know about the many advantages of using a Bean TrackPULL Tractor.

The Bean TrackPULL is very light, weighing only 2875 lbs. It pulls itself over soft soil, and does not sink in nor does it pack the soil.

How It Works

The Bean TrackPULL Tractor is built on a substantial track 12 inches by 32 inches on the ground. The power in the tractor pulls it along its own revolving track. That's why it does not pack the soil—gets long traction—turns easily to right or left—can make a complete turn in a 10 ft. circle, is most economical in operation and a boy can easily work it. When the hot days come your team loafs and you get only an average half-day's work done in 10 hours. The Bean TrackPULL will work day and night if you want it to, and does the work all day long that a six-horse team could do if they worked hard continually.

The Price is Only \$975.00

Bean TrackPULL Tractor construction consists of a 10 H. P. (at belt) Le Roi 4-cylinder vertical type—4-cycle motor. Equipped with Donaldson air clarifier, Bosch ignition, Perflex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, Hyatt roller bearings in track wheel sprocket and track rollers, six New Departure ball bearings in the transmission, running in grease and dust-proof. Gears are steel. No differential or other complicated mechanism.

Making figure 8 around trees and leaving no unfinished work.

Pulling a spring-track cultivator between rows 12½ feet apart.

Prompt Deliveries in April

Our entire output is sold a month in advance and we are working night and day. We are building a large addition to our factory to increase our capacity, so that we will be able to ship tractors that are ordered now, in April.

Mail the Coupon Today

We will gladly send you our folder, telling you more about the Bean TrackPULL Six-horse Tractor if you will fill in and mail to us the coupon below.

General Agricultural Review.

GRAIN AND HAY.

Rice day will be observed March 22 in Santa Clara county.

Alfalfa was being cut in Imperial county the first week of March.

Recent rains in Yolo county softened the crust that was damaging grain.

An alfalfa plant washed out by floods near Salinas has roots over eight feet long.

The Sutter-Butte Canal Co. is planting 150 acres of wheat on adobe to be irrigated.

Alfalfa is reported worth \$22 per ton baled in Imperial and San Bernardino counties.

The Pacific Rice Growers' Ass'n recently sold 25,000 sacks of rice to the Lake Charles, La., Milling Co.

Last year's Australian wheat crop was \$143,478,000 bushels or nearly 60 per cent greater than the average of five years.

A Ringling circus man is reported to be shipping hay from Australia through Oakland to the East because that is cheaper than American hay.

Twenty-four carloads of rice was shipped in one week recently from Colusa to markets all over U. S. via six transcontinental routes. Three cars went direct to Maine.

San Joaquin Valley is feeling a great hay shortage, due partly to unusual amounts shipped to Southern California and partly to the extra feeding due to grass shortage.

In Yuma Valley, Arizona, 28,283 acres were cropped in 1916 according to the U. S. Dept. Agr. and the area is likely to be 100,000 acres in 1917. Alfalfa was the most important crop.

About 200,000 acres of alfalfa are being planted in California according to one of the principal seed companies. About half of this will be additional acreage to last year's crop.

Although drouth reduced the Argentine rice crop by one-third last year, the production is estimated at 15,000,000 pounds. That country imports 100,000,000 pounds annually.

VEGETABLES AND FIELD CROPS.

Cotton planting was progressing the first week in March in Imperial county.

Sugar beet planting commenced at Brentwood early in March. There will be about 1,000 acres.

The first asparagus sent from Oakley district late in February brought \$2 per bunch in New York.

Stevinson, Merced county, farmers are preparing to plant 5,000 acres of beans, double last year's acreage.

Stanislaus county is to have about 100 per cent increase in bean acreage this year, about 20,000 acres of all varieties.

It is reported that over 2,000,000 bags of 1917 beans have been contracted in San Joaquin Valley for the British government.

A permit has been issued for the importation of 600 tons of potatoes from Victoria, Australia. Others are to follow, since that State has com-

plied with the regulations required by the U. S. Dept. Agr.

"It has repeatedly occurred that periods of high prices in certain crops are followed by seasons in which the same product is a drug on the market," says J. R. Hepler of the Wisconsin College of Agriculture.

An unusually large acreage is being planted to potatoes in the Kings River bottom in Fresno county. Horticultural Commissioner Roullard is urging seed treatment to avoid permanent infection of the ground with scab.

It is said that the Pomona Valley will enjoy a boom in the tomato business this year. Every canning factory in Southern California is contracting tomatoes from a big acreage. Ten dollars per ton is being paid against eight dollars last year.

Egyptian cotton is to cotton what cream is to milk, while Durango corresponds to skim milk and Mebane to whey, according to Smith Jackson of Imperial county, who grew five acres Egyptian last year. It is reported that 1,000 acres of this variety will be grown in Imperial Valley this year.

CITRUS AND SEMI-TROPICAL.

Black figs are being contracted at 6 cents in Yolo county.

Corona citrus growers are calling for white fruit pickers at \$2 to \$2.25 per day.

The San Fernando Fruit Growers' Ass'n has resolved that people taking oranges should be prosecuted.

Sixty foreign pickers for the Corona Lemon Co. recently struck for an increase from \$1.80 to \$2 per day.

Imports of figs from Portugal to U. S. last year were reported over 10,000,000 pounds or five times normal quantities.

Butte county is protesting against the proposed law to create a commission to establish maturity requirements for oranges, since they fear the chemical test. Tulare county people are fighting for the law.

A car of 1200 cases of olives was shipped Mar. 5 from the Fallbrook plant of the Cal. Associated Olive Co. to New York. Each car was labeled with a certificate that the olives complied with the standard of ripeness, etc., adopted in the office of the State Market Director.

DECIDUOUS FRUITS AND NUTS.

Pear spraying for scab is about complete in Napa county.

It is reported that the Georgia peach crop has been seriously frosted.

Tuscan and Phillips peaches have been contracted at Selma at \$42.50 per ton.

Fresno county peach contracts have been made at \$40 per ton; Lovells at \$25.

Buyers in Merced county are reported to have been trying to get cling peaches at \$35.

Damage to deciduous fruits in bloom is reported in various parts of the State, due both to frost and to rains.

Capay almonds were not hurt so much as feared, according to Horticultural Commissioner C. W. Gould, but apricots were damaged as much as 75 per cent in some cases.

Apricots, prunes, and peaches in the order named, were the leading fruits planted in Kings county in February, according to Horticultural Commissioner Fred K. Howard.

British breweries have been ordered to reduce their output two-thirds in order to save food value of grain, so California hop growers are pulling up their hops and planting to other crops, including peaches.

Practically no nursery stock being grown in San Luis Obispo county

and the inspection of imported nursery stock being practically over, Horticultural Commissioner S. V. Christensen estimates that the following acreage will be planted in the county this spring, such estimate being based on the total number of trees inspected, and an average of 70 trees being planted to the acre: Almonds, 2565; pear, 800; prune, 554; apricot, 279; peach, 147; apples, 82; mixed varieties, 67; walnut, 31; cherry, 12; grapes, 10; total, 4547. This total will increase the county's acreage of fruit and nut trees 44.7 per cent. The Paso Robles and Templeton districts lead in the planting of almonds; Atascadero in deciduous fruits.

GRAPES AND SMALL FRUITS.

Strawberry shipments are being made from Brawley this week.

The grape troubles which J. W. Jeffrey has been investigating at Dinuba cannot be properly termed "diseases," but seem due to low vitality.

A Sutter county vineyardist thinks local nurserymen are robbing him by charging \$35 per thousand for Thompson cuttings which could be bought outside the county for \$15 if the Supervisors would allow the importation.

The Agricultural Workers' Union has established an employment bureau in Fresno to bring vineyardists and workers together. Many of the workers are getting the \$2.50 per day of eight hours which the union is demanding.

The State Viticultural Commissioners are indignant at the following definition of their duties as proposed in a bill before legislature: "It shall be the duty of the board to collect and disseminate useful information relating to viticulture, including the best methods of growing raisin and table grapes and the best methods of handling the same. They shall also give attention to the question of what uses can be made of wine grapes, should the manufacture of wines containing alcohol be prohibited, and of how best to transform wine grape vineyards into other uses where the growing of wine grapes is not profitable. The board shall do all in its power to find uses for grapes which will be profitable to the growers without being harmful to the commonwealth." It seems to us that this would be welcomed by wine grape growers as one of the most constructive things the board could do.

Pull Big Stumps by hand

Showing easy lever operation

Clear your stump land cheaply—no digging, no expense for teams and powder. One man with a K can rip out any stump that can be pulled with the best inch steel cable.

Works by leverage—same principle as a jack. 100 pounds pull on the lever gives a 48-ton pull on the stump. Made of Krupp steel—guaranteed against breakage. Endorsed by U. S. Government experts.

Thousand-Headed Kale for Coast Dairies.

[Written for Pacific Rural Press.]

Thousand-headed kale will yield more good succulent feed for dairy cows in the coast dairy districts than anything J. D. Williams of Sonoma county has found in 30 years time, and that means a lot, too, for Mr. Williams has a reputation of being the original experimenter of the locality, but at the same time one of, if not the most, successful farmer and dairyman also.

Mr. Williams plants his kale just as soon as he can get onto the land in the spring after the heavy rains are over, usually some time in April. Various methods have been used in planting, but the most successful is to plant the seed in hills about three feet apart each way. Transplanting the plants from seed bed to field was tried, but proved expensive and tiresome, so hill planting is always the rule now.

This is done with a rope for marking and a short-handled hoe, with a three-foot mark to determine the right distance for the hills. Because the seed is small, and also cheap, several are usually planted in each hill and then thinned out when they appear above the ground.

Cultivation is practiced often enough to insure a good mulch at all times till the plants are so large that the cultivator can no longer be

driven down the rows. As the rows run both ways of the field, cross-cultivation is possible.

During the summer the plants do not grow very fast, but after the first rains they begin to shoot out leaves at a rapid rate and by October 1 they are large enough to begin feeding. From then on till December a wagon-load a day is hauled to the hill pasture where it is scattered around over the ground for the 30 head of milk cows and the young and dry stock.

As the cattle are not turned into the feeding yard till after the evening milking no bad flavor to the milk results, but the production of the cows immediately improves.

By cutting close to the ground with an ax an average yield of 50 to 60 tons of green feed per acre is secured in this manner and this is all utilized on the Williams ranch, the small flock of sheep which are maintained on the place consuming the stalks after the cows are through with them.

While some people object to thousand-headed kale because of the difficulty in ridding the ground of the roots and short stalks left after harvesting, Mr. Williams says he finds it very little work to get rid of them by plowing the land good and then harrowing into piles all that are left on the surface. These are carried off from the field and either burned or put into gulleys or ditches on the ranch.

OTHER COWS DRY, THESE FED SILAGE.

[Written for Pacific Rural Press.]

Slow filling and fine chopping materially increases the amount of corn silage that may be stored in a silo, according to T. B. Purvine of Sonoma county, who is an old silo user.

The measured capacity of Mr. Purvine's silo is 120 tons; but by setting his machine so the corn is cut three-eighths of an inch long and by cutting only about six hours at a time, he is able to put about 150 tons in his silo each year.

In few localities are the benefits of a silo more pronounced than on such ranches as Mr. Purvine's; for the hill pastures which are largely depended upon furnish a succulent feed for a comparatively short season, the custom usually practiced in the district being to dry up the cows between grass seasons. This is not necessary on the Purvine ranch; and when the silage is supplemented with oat hay and some concentrates, the cows produce as heavily during the winter months, when butterfat is high, as at any other time of the year.

See the Difference BETWEEN THE NEW DE LAVAL AND OTHER CREAM SEPARATORS

YOU can see the difference between a NEW DE LAVAL and any other cream separator right away.

And five minutes spent in comparing the bowl construction, the size, material and finish of all the working parts, the manner of oiling, the tinware and the frames, will surely convince you of the superiority of De Laval construction and workmanship.

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.

Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

Speed Indicators can be furnished for use on old style De Laval machines at a cost of \$3.00 each.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do—the De Laval one day and the other machine the next—for a couple of weeks, you will see still greater difference in the work of the two machines.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you prove the difference for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

Do You Want Long Distance Breeding?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCARTRA KORNDYKE, whose dam is TILLY ALCARTRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

A Criticism of the New Dairy Law.

[Written for Pacific Rural Press by Dr. H. B. Wintringham, Petaluma.]

In the new dairy law which went into effect October 1, 1916, certain exemptions were made for the applications of the tuberculin test. These exemptions cover all cows the milk from which is pasteurized or whose milk is sold to a cheese factory.

Practically all creameries pasteurize their cream; so also the milk dealers in all large cities. These people were doing this before the law was passed, as they had come to realize that in so doing they were increasing the value of their product.

These dairy cows whose product is pasteurized comprise approximately 90 per cent of the dairy cows in the State. The remaining 10 per cent which are subject to the tuberculin test are therefore much in the minority.

The prevalence of tuberculosis in California is an acknowledged fact; and the writer is not far wrong in saying that in the Sonoma and Marin section at least 50 per cent of the dairy cows are infected with tuberculosis. It is also recognized that in herds where 50 per cent of the animals are infected, it is practically impossible to clean them up by using the test and getting rid of the reactors.

This being the case, how is the testing of 10 per cent of the cows in the State going to clean up the tuberculosis? How is it going to keep the milk free from the tubercular bacillus, when the small herds subject to the test draw or replace most of their cows from the large herds infected with tuberculosis which do not have to test?

The \$10,000 spent by the State

Veterinarian's office for this work is money thrown away. The State Veterinarian is now asking for \$70,000 to carry on the work for the next two years.

It would seem to the writer that the logical attempt to clean up the State would be to increase the powers of the Dairy Bureau and provide the Bureau with a sufficient force of Veterinary Sanitarians to educate the dairymen to a realization of the benefits of sanitation and hygiene in connection with their establishments and to properly enforce the existing laws. Later, when conditions and standards had been raised in the dairies, the tuberculin test could be used and some real benefits derived from its use.

Until such time as the sanitary conditions of the dairies are raised the use of the tuberculin test as prescribed by law today is a farce and an unjust procedure.

[Dr. Wintringham evidently looks on the law as an attempt to clean up tuberculosis of cattle; but we believe that it was drawn up primarily to protect consumers from infection with tuberculosis from cattle. This seems all the more necessary from the prevalence of the cattle disease pointed out by this article. Yet it was not intended to infer that the Sonoma-Marine district, or California as a whole, is any worse infected than the other dairy districts of U. S.—Eds.]

NEVADA COWS MAKE GOOD RECORDS.

To the Editor: The Truckee-Carson Project Cow Testing Association completed its fourth month of testing in February with 16 cows out of 463 producing over 45 pounds of butterfat. Fewer cows have been tested this month than any since the organization was perfected; and the number of high producers has been proportionally less; but this is because most of the farmers breed for spring freshening. From now on, there should be a larger number of cows under test; and some very creditable records should be made, considering the fact that alfalfa hay is the sole feed used by most of the farmers. Owners of cows producing over 50 pounds for February were: A. L. Baker, 60.4 lbs. fat; F. E. Mobley, 54.2; W. A. Simmonds, 54.0; A. L. Baker, 52.3, 50.5; Ed. Morgan, 50.1; A. L. Baker, 50.0.

E. R. Eichner, Secretary.

Fallon, Nev.

The least cruel method of removing horns is by means of an application of caustic potash to the horn bottoms while the calf is from one to four days old. The hair is carefully clipped from the buttons and the moistened end of a stick of caustic potash is rubbed on the spot until the skin bleeds slightly.

Harry Clark, formerly with the Black Hawk Stock Ranch, is now looking after the Whitehall Estates Percherons. He reports sale of a two-year stallion by Londrocitos to Mr. Fleming of Lassen county; also nine fillies to the Pacific States Corporation of Tulare as foundation for a breeding farm. They also are by Londrocitos, the P. P. I. E. champion.

Can you do it? Every day?

No!—and if you have a Sharples Suction-feed Separator you don't have to, for it skims equally clean *whatever* speed you turn. But with every other separator you must turn the crank at just *exactly* the speed stamped on it, or you will lose cream—every time! The wonderful Sharples Suction-feed varies the milk feed in *direct proportion to the separating force*—never more milk in the bowl than it can *perfectly* separate. All other separators have a fixed milk feed. Thus when turned below speed much of the milk runs out without being perfectly separated, and some gets into the cream, making it thin and uneven. Thousands of actual tests have proven that 19 out of 20 persons *do* turn too slow most of the time, and that *everybody* turns too slow some of the time. Get a

SHARPLES SUCTION-FEED CREAM SEPARATOR

- the *only* separator that skims clean at widely varying speeds
- the *only* separator that delivers cream of unchanging thickness—all speeds
- the *only* separator you can turn faster and finish skimming quicker
- the *only* separator with just *one* piece in the bowl—no discs, easiest to clean
- the *only* separator with knee-low supply tank and a once-a-month oiling system

Sharples is positive insurance against carelessness and its consequent cream waste. We realized that it was far from sufficient that a separator *could* skim clean when properly handled. It was vitally necessary that it *would* skim clean—even when improperly handled. If any of the old-style fixed-feed separators would adopt a device for the purpose of notifying the operator when he is turning too slow, it would be an acknowledgement of the *vast superiority* of Sharples, which automatically *prevents* losses from irregular turning instead of simply announcing them. Write today for catalog to Dept. 31.

HOLSTEIN CATTLE

Twenty million dairy cows in the United States, and five million of that number unprofitable! Surely one great public benefactor is the dairyman who, by changing bad cows for good, seeks to produce two quarts of milk in place of one produced before. This progressive type of farmer, all over the continent, is either grading up his common cows with a purebred Holstein bull, or he has already installed the profitable purebred registered Holstein cows in his barns. He is adding to the wealth of the nation and to himself as well. Slowly, but surely, proper understanding will eliminate the unprofitable dairy cow.

"Gee! But I Have an Appetite!"

A cow that eats poorly usually milks poorly, and any poor milker is a loss. Lost Appetite is only one of the common cow ailments that quickly disappear after judicious use of Kow-Kure, the great cow medicine.

Kow-Kure has a record of over twenty years' success in the prevention and cure of such diseases as Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Bunches, etc. Most of these diseases spring from disordered digestive or genital organs, and Kow-Kure has strong medicinal qualities which tone up and permanently strengthen the entire system.

A trial is convincing. Kow-Kure is sold by feed dealers and druggists, in 50c and \$1.00 packages. Write for free treatise, "The Home Cow Doctor."

VACCINATION FOR HOG INSURANCE.

[Written for Pacific Rural Press.]

If you have a few hogs sick with cholera, there may be twice as many infected, but not yet showing symptoms; for it takes the disease six to ten days to show up after infection. Giving such pigs the simultaneous treatment simply adds fuel to the fire and they are likely to die. They would probably die anyway, but the serum alone treatment may save them and cannot hurt them if done in a sanitary way.

That is why so many farmers in California are vaccinating their pigs as insurance against the disease. The fact that vaccination has introduced the disease into some herds is no argument against vaccination; but is an argument in favor of knowing the record of the virus and serum as well as of the man who injects it. Virus and serum bottles are all labeled with dates after which they must not be used. Absence of these labels and dates should be taken as proof that the stuff is dangerous. Only by the previous record of the man who is to vaccinate the pigs, and a knowledge whether the serum and virus have been kept consistently cold, will insure safety. Sometimes improper care of the serum can be detected by its sour smell and muddy color.

Eight to ten weeks old is the proper age to vaccinate, but if disease is in the herd, a serum alone treatment is advisable any time after the first three or four weeks, during which they usually seem immune. Sows are likely to abort if vaccinated with virus and serum within a month before farrowing.

FEEDING UNDERGRADE RICE.

To the Editor: I am offered some under-grade rice at about \$7.50 a ton, and planned to cook it and mix with under-grade corn, which I grind up here on the ranch. I can feed it to hogs or to my dairy milking cows or to my dry cows and calves. Will you advise me as to its feed value?

—W. B. W., Holt.

[Answered by Prof. J. I. Thompson,
University Farm, Davis.]

In answer to the attached inquiry, we are feeding rice experimentally now for the first time, and the experiment has not progressed far enough to enable us to tell anything about the desirability of this feed.

A good rice paddy has within 10 per cent as much feeding value as barley. The under-grade rice that your correspondent mentioned would be cheap at \$7.50 per ton, if it is a reasonable grade. If it is principally shriveled up hulls it would be high-priced at any cost.

We are feeding it whole to one lot and ground to another, but would expect most satisfactory results with rolled rice, and if facilities are available for cooking it, it would undoubtedly be safer to feed. Should prefer to feed it to market hogs until absolutely sure that no serious results will follow. Quite a number of people are feeding it in this part of the Sacramento Valley now, some to horses, others to cattle, and quite a number to hogs; and when it is used carefully as barley or corn would be used no unsatisfactory results have been reported. If changing from some kind of grain to rice I would prefer to make the change very, very gradually.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

Ten Stanislaus dairymen in one day were served with warrants for arrest on account of dirty dairies recently.

Forty grade Jerseys were recently auctioned in Imperial Valley for an average of \$107.77. The total of 65 cows in the sale averaged \$90.

The 1917 Dairy Cattle Congress will be held Oct. 1 to 7 at Waterloo, Iowa. A trainload of dairy cattle are expected from the Pacific Coast.

A \$100,000 Dried Milk Products Co. has been organized with headquarters in San Francisco and with plants to be located in the dairy districts.

W. F. Mitchell of Packwood Farm, Visalia, reports an official record of 31.78 pounds butter made by Fidessa Elana without special preparation or feeding previous to the test.

We have received a bulletin from Sec'y C. S. Plumb, of the American Kerry and Dexter Cattle Club, showing that not over 500 head of these cattle exist in America. There are only one or two herds of these breeds in California.

C. M. McLouth and I. F. Dado of Orland have just received an importation of registered Jerseys from Kentucky containing 19 head of

heifers and a bull. All of the cows in milk will be put on semi-official test at once.

The Tulare Cow Testing Ass'n contained 19 cows that produced over 50 pounds fat in Feb. Of these, five belonging to W. J. Higdon are registered. Of these, one produced 92.34 pounds fat. Of the 19, six produced over 70 pounds.

A. A. Jenkins of Tulare reports the following registered Jersey sales: two cows to R. H. Brittingham, Tulare; one bull, son of Gertie's Lad, to G. S. Look, San Luis Obispo; a son of Gertie's Son's Victor to Jas. Vincent of New Pine Creek, Oregon.

The Guernsey Belladia owned by W. H. Dupee of Santee has completed a record of 19,631.9 pounds milk and 934.05 pounds fat in one year. This exceeds the previous California record by 180 pounds fat and is the highest record west of the Mississippi.

The J. S. Gibson Co. of Williams, Colusa county, recently sold registered Holstein bulls to the following parties: San Joaquin Land and Farming Co., Fresno; Roeber Bros., Delavan, and E. W. Stanton, Jr., Gridley. They are offering some fine young bulls out of cows with semi-official yearly records.

The Marin County Cow Testing Ass'n has recently been formed, including 1071 cows in Nicasio-Hicks Valley, Olema, Bolinas, Point Reyes, and Geronimo. R. Pedrotti from the Ferndale Cow Testing Ass'n will test these cows. Directors of the Ass'n are D. D. McIsaac, E. Fellipini, R. Thompson, R. Roy, V. Bloom, E. Dickson and R. Casarotti.

Jersey breeders of Glenn county are to meet at Orland March 17 to organize a Glenn County Jersey Breeders' Ass'n. There are now about 25 dairymen in that county who have purebred Jersey cattle and it is hoped that by the formation of an association the breeding industry may be put on a more permanent basis. Speakers from a distance will be present to aid in the organization work.

SWINE.

W. D. Trehitt of Hanford reports that an acre of mangel beets has furnished plenty of green feed for his Poland Chinas this winter.

At the Wasco Farm Center market hog auction Mar. 10, five carloads of hogs sold at \$12.70, \$12.62½, and \$12.50 to Los Angeles buyers.

A. B. Humphrey of Escalon has immunized his 225 purebred Berkshires and figures on immunizing the pigs periodically as they grow old enough.

The Tweede Land Co. of Glenn county is finishing a carload of purebred Berkshires for the market, and hereafter expect to market nothing but purebred hogs.

HORSES, BEEF, AND SHEEP.

The Tagus Ranch of Tulare county has just brought 25 registered Polled Angus bulls from Iowa.

W. Gill and Son of Exeter recently bought 27 purebred Hereford and Durham bulls which had just been shipped into Los Angeles from Mo.

T. S. Glide, proprietor of Hillcrest Stock Farm at Davis, has a fine lot of purebred but unregistered Shorthorn bulls among his spring offering. He states that feed conditions have been worse in his locality than he ever saw them before.

NEVADA LIVESTOCK NOTES.

I. M. Hamilton recently shipped 27 horses and four mules from Fallon to Susanville, California.

Sheep shearing in Humboldt county began this week. About 80 per cent of the clip has been contracted at 27 to 34 cents.

The Reinhart Ranching and Livestock Co. of Winnemucca recently bought a \$2500 purebred stallion from Easton and Ward of Burlingame, Cal.

The Truckee-Carson Cow Testing Ass'n contained 16 cows that produced over 45 pounds fat in February. A. L. Baker's grade Jersey produced over 60 pounds.

John H. Cazier and Sons of Starr Valley have recently purchased 75 registered Hereford heifers from the Hereford Corporation of Wyoming. The Caziers already had about 100 registered females, but were unable to supply the demand for registered bulls.

POLAND CHINAS SELL WELL.

The Kings County Poland China Breeders' Association held its 3rd semi-annual sale at the Hanford Fair Grounds on Wednesday of last week. Eighty-two head passed under the auctioneer's hammer, bringing \$2932.50, an average of \$40.00 per head, \$11 more than the average at the last sale. The top prices of the sale were \$200 for a 10-months boar, sired by Panama Black and consigned by F. D. Ross, and \$150 for a sow consigned by J. W. Bernstein and bred to his boar President. Both went to Geo. H. Loughery of Visalia. A three-months granddaughter of Candy Kid and President was consigned by W. Bernstein "for ladies only" and was bought by Mrs. T. J. Gilkerson for \$82.50.

Other buyers were: Thos. Carlyle, Sanger; B. D. Crum, W. T. Dice, Fowler; L. M. Essick, Lemoore; H. D. Eberle, Tipton; W. S. Hubbard, R. F. Guerin, Visalia; A. F. Lewis, Riverdale; G. H. Loughery, Visalia; O. L. Linn, Mdesto; H. I. Marsh, Modesto; J. K. Macomber, Tipton; W. F. Mitchell, Visalia; F. Mathos, Traver; H. L. Stephens, Tipton; Vossler Bros., Porterville; Geo. Farmer, Hanford; Frank Johnson, Hardwick; W. C. Ramos, Lemoore; W. Bernstein, Hanford; C. F. Starr, Lemoore; F. D. Ross, Hanford; Mrs. T. J. Gilkerson, Lemoore; J. A. Crawshaw, Hanford. Auctioneer Ben Rhoades of Los Angeles was assisted by T. J. Gilkerson of Lemoore. An excellent lunch, in which roast pork figured largely, was served.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Coulson Poultry & Stock Food Co., Inc., Petaluma.

BAKER'S TRACELESS HARNESS

Best plow rig. NO WHIFFLETREES—NO TRACES. Handiest farm harness.

Indispensable in the orchard with special fitness for all low down work. You can hitch closer to your load, plow and cultivate close to the row and save all the worry to man and team. No weight of whiffletrees for man to lug. Everything clear behind team. Use our outfit and save your trees. Highest endorsement of farmers and fruit growers.

Write now. B. F. BAKER CO., NUMBER (1920) MAIN ST. BURNT HILLS, N. Y.

BLACK Percheron Stallion

9 Years old. Weight 1900 lbs. Broken to Harness. Sound.

A Good Breeder.

PRICE, \$350.

FOR SALE!

At a Bargain

One of the best and most productive ranches in the State of California is offered for sale. 87 Acres of rich sediment land, located north of Santa Clara, 1 mile from station, and 1¼ hours from San Francisco. The ranch is all level, but with sufficient slope for irrigation. It is fenced and cross-fenced, and divided into 8 fields, each supplied with water in concrete troughs.

The improvements consist of a good hard-finished house of 7 rooms, well built and substantial with modern plumbing and other conveniences. Large horse barn, good dairy barn, sheep, pig and poultry houses, cottage for help, yards, corrals, etc. All in perfect condition.

The water supply on the place is excellent; besides a flowing artesian well, which supplied all buildings and fields without pumping, the ranch borders on a stream of permanent running water, from which the whole place is irrigated. The price of this valuable property is only \$27,500. Terms of payment can be arranged. Tools and implements included.

This is one of the best and cheapest ranches in the State. Rigid investigation invited.

CALIFORNIA POLAND CHINA

The California Poland China Breeders' Ass'n was organized Mar. 6 at Hanford. Its first officers are: W. F. Bernstein, Hanford, president; O. L. Linn, Modesto, vice-president; R. H. Whitten, Los Angeles, secretary-treasurer; C. W. Hanna, Riverside; N. Hauck, Alton, Humboldt

county; H. I. Marsh, Modesto, and M. Bassett, Hanford, directors. Its next meeting will be at Davis during Farmers' Week. Dues are \$1 per year and each member is to contribute a hog to be auctioned at the State Fair. The first \$25 from each hog is to go into the Ass'n treasury. The Ass'n had 46 members by Mar. 10.

Napa Hospital Wins the Dairy Prize

Five grade cows in the dairy herd of Napa State Hospital are credited with the highest average production of butterfat for the month of February, for cows entered in the California State Dairy Cow Competition, viz., 67.665 pounds butterfat (credit being given for cows entered below full age in accordance with rule No. 4 governing the Competition); actual average production 63.696 pounds. The Napa State Hospital is, therefore, entitled to the Pacific Rural Press prize for this month.

Four other herds competed for the Pacific Rural Press prize during the past month for the highest production of 5 grades, the results being as follows: F. Stenzel, San Lorenzo, credited production 63.399 pounds butterfat, actual production 59.182 pounds; J. H. Guill, Jr., Chico, credited 51.675 pounds, actual 51.604 pounds; Hollow-Hill Farm, Colton, credited 51.152 pounds, actual 49.090 pounds; K. W. Abbott, Milpitas, credited 47.089 pounds, actual 45.102 pounds.

None of the cows included in the average production for the Napa State Hospital or Abbott herds competed for the prizes awarded to these herds for the months of November and January respectively.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

ATTENTION, STOCK MEN! Population increasing, meat decreasing. Greatest rush in years for Government and State land. Free homes. Safe investments without residence. School, State, Indian, Government lands. Now available. You have nine rights now worth \$1,000 each. Booklet and 640 acre Homestead Circular Free. Write Joseph Clark, Sacramento, Cal.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Winter Lamb Feeding Experience.

[Written for Pacific Rural Press.]

In view of the fact that most everybody who has had anything to do with sheep for the last year or two has made money, it is not surprising to learn of new ways being evolved to get in on some of the profits of these "golden-hoofed" ani-

which in this case was extraordinarily big. But it will also be noted that an excessive price was charged for all of the feed except salt, so we may assume that the excessive spread is offset by high-priced feeds which were used and which are by no

December 17, 1916:		
150 lambs, wght. 12,970 lbs. \$7 per head.....		\$1950.00
320 lbs. hay per day for 60 days.....	19200 lbs. @ \$17 per ton	162.20
100 lbs. silage per day for 60 days.....	6,000 lbs. @ \$5 per ton	15.00
6750 lbs. corn @ \$2.50 per cwt.....		168.75
4 sacks salt @ 75c.....		3.00
Total cost.....		\$1398.95
February 17, 1917:		
Sold 149 lambs, wght. 15,995 lbs. @ \$10.25 per cwt.....		\$1639.00
January 17, 1917:		
Killed one lamb, wght. 84 lbs. @ \$10.25 per cwt.....		\$ 8.23

Cost per pound of gain—\$0.1122.		
Cost of feed for 60 days—\$348.95.		

mals which have contributed most in a financial way to the larger handler in the past in California; but which may find a new way of benefitting the smaller farmer if further experience proves the desirability of such practices as given below.

The ranch where this experiment was conducted is situated in one of the interior valleys, dairying being the chief occupation of the owner. In December of last year he found that he had a surplus of alfalfa hay, corn silage, and shelled corn. As sheep looked attractive to him, he built a low galvanized iron-roofed shelter in one of his corrals, rigged up miniature feed troughs and watering troughs, and bought 150 Merino lambs, the total weight of which was 12,970 pounds, or an average of 86.4 pounds per head. The total cost of the lot was \$1050, or \$7 a head delivered on the farm.

They were immediately placed in the small corral which had been set aside for them. The corral would have cared for 1,000 head just as well, according to the owner, for it was found that they did not need much more room than that provided by the shelter. Drinking water was within easy access in a trough close to the feeding shed.

The ration fed and eaten was 320 pounds chopped alfalfa, 100 pounds silage, and an average of about 112 pounds of corn a day, together with all the salt that they cared for.

After receiving this care and feed for 60 days they were sold Feb. 17, one lamb having been killed on Jan. 17 that weighed 84 pounds, and the other 149 having a total weight of 16,079 pounds, or an average of almost 108 pounds, a gain per lamb of approximately 21.5 pounds.

As shown below, the cost per pound of gain on the lot was at the rate of \$11.22 a hundred, which would show financial disaster if it were not for the spread in the market between buying and selling time,

means seasonal averages. The experiment is chiefly of interest as it brings in feeds which have not previously been used extensively in this State. They were proclaimed by the buyer to be as prime a lot of lambs

as he ever saw in the Middle West. A resume is given above.

G. H. Loughery is laying substantial foundations for general stock raising on his 1065 acres of river bottom land near Visalia. He expects to raise Shorthorn and Holstein cattle, Shropshire sheep, and Poland China hogs. The entire place is being crossfenced, buildings erected, and ground broken for several hundred acres of alfalfa. Only purebred stock of the best blood lines will be used. Mr. Loughery has been a prominent buyer at the recent auction sales and already has some excellent foundation stock.

Heap big mileage!

In every layer of fabric, in every bit of rubber—permeating the entire casing! No wonder Savage Tires average so much greater mileage.

Savage Tires are built to give mileage first, then road comfort and complete satisfaction—they are not made to sell at a price. And yet Savages cost no more than ordinary casings.

Sold through our own distributors. We put the middleman's profit into extra quality—"Heap big mileage!" Watch for the red Savage sign.

ABSORBINE STOPS LAMENESS
from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone, or similar trouble and gets horse going sound. It acts mildly but quickly and good results are lasting. Does not blister or remove the hair and horse can be worked. Page 17 in pamphlet with each bottle tells how. \$2.00 a bottle delivered. Horse Book 9 M free.
ABSORBINE, JR., the antiseptic liniment for mankind, reduces Painful Swellings, Enlarged Glands, Wens, Bruises, Varicose Veins; heals Sores. Allays Pain. Will tell you more if you write. \$1 and \$2 a bottle at dealers or delivered. Liberal trial bottle for 10c stamps.
W. F. YOUNG, P.D.F., 86 Temple St., Springfield, Mass.

VETERINARY QUERIES.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]
[Subscribers wishing an immediate reply should send money order for \$1.00.
No charge for questions answered through this department. Name and address of
subscriber must accompany each query.]

PERSISTENT LOOSENESS OF BOWELS.

To the Editor: What can I do for a cow which has had running of the bowels about a year? She came fresh with a second calf about a month ago.—C. A., Watsonville.

Give this animal six 30-grain tablets Sulpho-carbolates dissolved in warm water twice a day. Also give one tablespoonful aromatic sulphuric acid diluted in one pail of water three times a day.

BUMP WHERE COLLAR BOIL WAS.

To the Editor: A collar boil on a horse was opened by a veterinarian. It healed but left a large, hard, gristly bump.—C. W. B., Warm Springs.

The only remedy left is to have the hard lump cut out as there is no external remedy which will absorb it. This often happens in these cases and is no fault of the veterinarian who opened it originally.

BURNING DOESN'T CURE THRUSH

To the Editor: I have been using bluestone on a bad thrush and also burned the hoof out with a red hot iron. What will cure it?—R. A. G., Lodi.

Pack the thrushy parts with cerate of cantharides. Do this every third day. The trouble usually disappears after the second application; but in unusual cases a few more applications may be necessary.

ABORTION VACCINE

To the Editor: As there is no veterinarian near, I would like information how to vaccinate for abortion.—E. M. C., Eagleville.

Abortion vaccine can be obtained from the writer with full instructions for its use at a dollar a head plus three dollars for a syringe to do the work.

HAIR OFF FROM AROUND EYES.

To the Editor: Some calves have a rough swelling breaking out around the eyes and the hair comes off.—B. M. B., Corning.

This is ringworm. Wash the swellings and dry well, then paint with tincture of iodine once a day for three days or longer if necessary.

KIDNEY TROUBLE DUE TO ALFALFA.

To the Editor: A horse four years old seems to have had kidney trouble since last fall. When not working, he seems normal, but while working and particularly at hard work, he often hesitates as if he wanted to urinate. When I first noticed the trouble, he was being fed alfalfa hay. I changed to wheat hay with no improvement. During early winter he was fed alfalfa hay again, then

EGGS FOR HOGS.

To the Editor: What would be the best feed for hogs to go with incubator eggs? We have available large quantities of eggs after candling, which we want to use for hog feed, together with whatever else is necessary.—A. E. B., Campbell.

Since eggs are very high in protein, grain or mill feed high in carbohydrates would balance the ration.

Simply dipping the hoofs into a pail of water every day will do wonders to keep the horse's feet in growing condition.

changed back to wheat. While working, he urinates two or three times a day more than the others.—J. T. F., Klink.

The trouble is due to too much alfalfa feeding. Discontinue the alfalfa hay altogether. Give him one dram hexamethylamine dissolved in water twice a day. Improvement will be slow.

STOCK JOTTINGS.

Shoes should be reset every four or five weeks.

Save yourself the price of a horse by providing him with a blanket.

Level the feet of the horse with a rasp. Long toes start ringbones.

A few good ewes well mated are more profitable than a large number of indifferent ones.

It is well to have a part of the cows drop their calves in the spring and a part of them freshen in the fall. This insures a steady income from the dairy, and gives the farmer more freedom during the spring

Hog Cholera Serum

I represent one of the greatest Government Inspected Hog Cholera Serum Plants in the whole country.

NO BETTER SERUM MADE.

\$1150 F. o. b.
Racine
Mitchell Junior—a 40 h. p. Six
120-inch Wheelbase

Mitchell
SIXES

\$1460 F. o. b.
Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

Now an \$1150 Six Much Like the Larger Mitchell

John W. Bate believes that efficiency requires two sizes in Mitchells.

A seven-passenger car, to be roomy, must measure 127 inches from hub to hub. And 48 horsepower is the proper power.

But a 5-passenger car will be just as roomy with a 120-inch wheelbase. And a 40-horsepower motor gives it power enough.

So, to meet both conditions, we this year build a Mitchell and a Mitchell Junior. You don't need to pay for room or power not wanted.

Every Penny Counts

The Mitchell advantages lie in making every penny count. John W. Bate, the great efficiency expert, has spent years here to attain that.

He designed this whole 45-acre plant to build Mitchell cars economically. He equipped it with thousands of special machines. Every part is built here at the lowest factory cost. On this year's output his methods will save us at least \$4,000,000.

There is no other factory like this building high-grade cars.

Hundreds of Extras

You see the result in hundreds of extras—all paid for by factory savings.

There are 31 features—like a power tire pump—which are practically unique to the Mitchell.

We have doubled our margins of safety. This year every vital part has 100 per cent over-strength.

Over 440 parts are built of toughened steel. Many parts are oversize. Many are built of costly Chrome-Vanadium.

In luxury and beauty the Mitchell excels any other car in its

class. The finish coats are fixed by heat, to give a deep, enduring lustre. A rare-grade leather is employed. This year we have added 24 per cent to the cost of these items alone.

See What Men Miss

See what men miss who buy cars without these extra features. See the 31 attractions, most of which are found in Mitchells only. See what luxurious bodies we can give you at these prices, because of our own body plant.

Then consider the value of this double-strength. It means a lifetime car.

See what it means in the Bate cantilever springs. In two years of use, on thousands of cars, not one of these springs has broken.

Those are the reasons why men are choosing Mitchells in such an ever-increasing way. This year our output is increased 2½ times over. Men don't want to miss these extras.

If you don't know the nearest Mitchell dealer, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price \$1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¾-inch smaller bore than larger Mitchell.

Price \$1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

Raising Poultry for Profit

LIGHTS INCREASE EGGS.

Electric lights morning and evening in winter time increased egg production remarkably at University Farm at Davis, Cal., last winter, according to Prof. J. E. Dougherty.

A pen of 123 S. C. W. Leghorn one and two-year old fowls were started on a preliminary test on November 19, 1916.

The lights were first turned on at 5 p. m. November 19 and thereafter lighted at 5:15 a. m., turned off at daylight, lighted again at dusk, and put out at 9 p. m. daily. The following table clearly shows the effect that the use of artificial lighting has had upon the pens in which it was used:

Percentage of Eggs from		Lighted and Unlighted Pens.					
		Dec. 3	Dec. 17	Dec. 31	Jan. 14	Jan. 28	Feb. 11
2 weeks period ending	Dec. 3	Dec. 17	Dec. 31	Jan. 14	Jan. 28	Feb. 11
Lighted pen No. 1	6.75	52.1	53.7	56.9	53.1	57.8
Lighted pen No. 2	2.7	35.3	35.4	55.4	54.7	57.6
January pullets	28.2	30.9	45.4	39.4	45.0	67.0
February pullets	32.3	25.6	37.6	31.0	37.7	61.7
March pullets	21.0	27.0	35.8	28.7	42.4	61.5
Average of flock of 1700 layers	9.0	14.0	20.1	20.2	23.3	40.0
omitting lighted pens	
Began using electric lights in lighted pen No. 1 Nov. 19, 1916.	
Began using electric lights in lighted pen No. 2 Dec. 12, 1916.	

Because of the remarkable increase in egg production from week to week following the use of electric lights, it was thought advisable to check the results secured with the first lighted pen by lighting another similar pen in the same way. So, on December 12, 1916, another pen of 94 S. C. W. Leghorn hens, 2 to 4 years of age, was lighted artificially before daylight and after dark, with the results as clearly set forth in the above table.

The only facts brought out by our investigation to date are that the use of electric lights has increased production, as shown in the table with small increase in feed consumption. Using two 50-watt Mazda lamps for 100 fowls for an average of six hours per day at 4c per kilowatt, would cost 2½c per day.

An increase from 20 per cent to 60 per cent production, with eggs selling at 40c per doz. in December, would mean an increase in gross income of forty-one cents per hen, or \$41.33 per 100 laying hens. From this gross income would have to be subtracted the cost of lighting and the additional feed consumed. These preliminary results cannot be regarded as conclusive, but justify further investigation.

TIME TO PLANT GREEN FEED.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

There has not been such a favorable spring for the farmer and small poultryman for many years. But to get the most out of it we must now look ahead and prepare for the dry season that is bound to come; or it would not be our own California. What to plant to get the most amount of good out of a small space is what we need to consider. I consider the big Jersey kale will produce the most green feed to the acre of anything, under ordinary cultivation. Next in quantity is good Essex rape, but a great deal of seed is sold as Essex rape that does not appear to me to be the right thing. Those who have a patch of alfalfa need not worry over the green feed question; all they need do is cut it into suit-

able lengths, if the poultry are yarded; and let them run on it, if loose. The plan of having two yards, one of which is sown to alfalfa, is a great saving of labor and time. In this case you just open the gate and allow the hens one hour a day on the green feed, keep it well irrigated and it is surprising how much it will produce. And in the hour or so the chickens are on the alfalfa they use every minute of the time in supplying their needs, instead of trampling the green down, as they do when given full swing. It does not require a very large patch when it can be irrigated, to serve a few hundred hens. All kinds of cabbage are "good; especially useful are the

large late kinds that grow monstrous heads under good cultivation. Then we have the Cos lettuce, a good green for both quantity and quality. Everything, young and old, likes lettuce and the Cos, if irrigated and the soil kept stirred, will give an immense amount of feed.

If you have only a small patch of land at your disposal, but have water and fertilizer, the one thing to plant is the new variety of Swiss chard, called "Lucullus." It grows to a height of two and a half feet, under good cultivation, and you can use the white part on the table for asparagus and feed the rest to the chickens, who will eat the last bit. This is indeed a wonderful plant that pays three-fold for water and fertilizer. You can cut it as often as you like and it will, in a few days, have new stalks as thick around as rhubarb and every bit edible.

Then for fall use and into winter and early spring, all of the beet family are nourishing and succulent at the same time. Winter Golden Tankard or Golden Giant gives immense crops and they can be planted late, after all your other work is done. Or they may be planted as a second crop after lettuce or Essex rape have given of their best.

In the face of such high prices for grain, it is the wise man who plants something that will not only help out on the feed bills but keep his hens healthy and the egg basket full all the year round. Just a few minutes' work with your thinker, after the day's labor, will bring to mind how you can save many dol-

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

THE J. E. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hoganized White Leghorns. Bigelow chix are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. Shipped on approval; examination before paying. The Bigelow Poultry Ranch Sonoma Cal.

HIGHEST CLASS—Winners at State Fair, Oakland, Modesto, Reno. White Rocks and White Leghorns. Incubator chicks. Rocks, \$25.00 per 100; Leghorns, 10.00 per 100; Hatching Eggs, \$2.00, \$3.00, and \$10.00 per 15, according to quality. Rock Eggs, \$10.00 per 100; Leghorn Eggs, \$6.00 per 100, from range flocks. The best of stock and a fair deal. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

EXTRA QUALITY White Leghorn chicks, 12c until March 1st, then 10c. Carefully line bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying, and lose a dollar per pullet in raising; get the Best and Succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

BARRED PLYMOUTH ROCKS — COCKERELS—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nine years. Send for Catalog. Chas. H. Voden, Box 398, Los Gatos, Calif.

ROOFDEN RANCH CHICKS are good chicks, well hatched from first-class utility breeding stock—money-making egg producers. The prices are right—7c to 14c, depending on breed, month, quantity (dozen to thousands). White, Buff, Brown Leghorns; Black Minorcas, Rhode Island Reds, Barred Rocks for dollars and sense. Send card for circular. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's, 1000's, hatched right in our \$60,000.00 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs, Peabeside Poultry Farm and Hatchery, Sunnyvale, California.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorns. \$10 per 100; \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

THOROUGHbred WHITE LEGHORN and Rhode Island Red Chicks. Delivery up to June first. Our stock are strong and vigorous, are practically non-setters and heavy winter egg producers. Brooke Farm, Rancho Del Paso, Office 807 J St., Sacramento.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. Per 100, March \$10.00; April and May, \$9.00. Reduction in large lots. "Chicks well hatched are half raised." San Jose Hatchery, 373 Meridian Road, San Jose, Cal.

BABY CHICKS—HATCHINGS EGGS—White, Buff, Brown Leghorns, R. I. Reds, Barred Rocks. Sturdy chicks from well-mated fowls. Prompt, efficient service. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

200-250 EGG PRIZE LEGHORNS, Rocks, Reds, Wyandottes, Anconas. Eggs. Chicks surprisingly reasonable considering quality. \$3-10 profit, every hen. Hundreds satisfied customers. M. Beeson, Pasadena, Calif.

BABY CHICKS—We hatch from our own stock of 10,000 vigorous, healthy S. C. White Leghorn hens of heavy laying strain. Write for price list and further particulars. Geppre Brothers, Petaluma, California.

HATCHING EGGS—90 per cent fertility. From Hoganized S. C. White Leghorns only. Re-mated in February. Prices reduced for March and April. Write at once. Pine Tree Poultry Farm, Los Gatos.

HOGANIZED AND TESTED—220-egg type White Orpingtons and Buttercups. Hatching eggs, chicks and cockerels for sale. Reasonable prices. For particulars, write M. Woodhams, San Mateo, Cal.

SELECTED S. C. White Leghorn and Barred Rock eggs for hatching from hens typed to lay 200 to 250 eggs per year each. Baby chicks in season. Write for prices. Jay Maxwell, Madera, Cal.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs. Chicks. Stock. Also Rose Comb Reds. Mating list ready. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

BLACK LEGHORNS AND SILVER CAMPINES—Stock direct from leading Eastern breeders, a few hatching eggs reasonable. A. C. Hayes, Blaney Ave., Cupertino, Cal.

HICKS JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" Free.

GIVE the Black Minorcas a trial. Guaranteed first class. Eggs \$6 per hundred, \$1.25 per setting. Chicks, \$12 per hundred. Ezra Mosher, Union Station, Napa.

BABY CHICKS—From select free-range White Leghorn stock. Place orders early. Prices on application. Western Hatchery, Petaluma, Cal. W. S. Waldorf, Prop.

EARL E. SANDERS, Modesto, Cal., breeder of M. B. Turkeys, S. C. White Minorcas, S. C. Black Minorcas and S. C. Barred Plymouth Rocks. Nothing but the best.

S. C. RHODE ISLAND REDS—Pullets and Cockerels. One Black Orpington Cock. Eggs from R. I. Reds and Silver Campines. Mrs. E. S. Spaulding, Woodland, Cal.

MODEL POULTRY FARM—White Leghorn specialists. Our thirteenth year. Baby Chix and Hatching Eggs for sale. W. C. Smith, Prom., Corning, Cal.

"EASTMAN'S BRED-TO-LAY" Barred Plymouth Rocks—Chicks and Eggs. We Hoganize and trapnest. Fairmead Poultry Farm, Fairmead, Cal.

ANCONAS—Prize winners everywhere exhibited. 35 first prizes in last two years. Catalosue free. T. E. Silva, 3620 Grove St., Oakland, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

BABY CHICKS (White Leghorns)—shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, E. F. D., Sonoma, Cal.

HOPLAND STOCK FARM, POULTRY DEPT.

White Leghorn and White Plymouth Rock Cockerels. White Leghorns and White Rock Baby Chicks hatched from specially selected heavy-laying stock. Prices same as last season. White Leghorns, January and February delivery, \$12.50 per hundred; March, \$10.00; after April \$10.00. Write Plymouth Rocks, \$15.00 per hundred. All E. O. B. Hopland.

San Francisco Office,

1210 Flood Bldg.

BUFF ORPINGTONS—BUFF LEGHORNS—Winners at Riverside, San Diego, Los Angeles in strongest competition. Eggs, settings and incubator lots. Chicks for April and May. Free mating list. The Ferris Ranch, E. 2, 114D, Pomona, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Stawetaki, Route 2, San Jose, Cal.

RHODE ISLAND RED and White Leghorn Eggs and Chicks. Splendid layers, large eggs. Send for circular. Rosedale Ranch, Hayward, Cal.

BLACK MINORCAS—Largest egg; whitest flesh. Eggs, \$1.00 per 13; \$5.50 per 100. Edward A. Hall, R. F. D. 1, Watsonville, Cal.

BUFF ORPINGTONS—Barred Rocks, Ringlet strain. Eggs \$2, \$3. Runner Duck eggs, \$1.50. Glendale, Fleming Ave., San Jose, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons, Wm. A. French, 545 W. Park St., Stockton, Cal.

THOROUGHbred WHITE PLYMOUTH ROCK—Eggs, \$1.25 per setting, prepaid. H. G. Nickel, Vinuba, Cal.

LASHER'S HATCHERY, PETALUMA—Write for booklet, "The Day-Old Chick Business" and price list.

WHITE PLYMOUTH ROCKS—Hatching eggs from splendid layers. Mrs. J. B. Tupper, Route A, Ceres, Cal.

PEARL GUINEA FOWL—\$2.00 per pair. Mrs. Kate Lambert Newark, Cal.

RHODE ISLAND REDS—Eggs, \$1.00 for 15. P. M. Cox, Sonoma, Cal.

TURKEYS, DUCKS, AND GEESE.

BUFF DUCKS—Weigh like a Pekin, lay like a Runner. White egg strain. Winners at the best Western shows for past three years. Eggs, settings, and small incubator lots. Duckings in April. Mating list. The Ferris Ranch, E. 2, 114D, Pomona, Cal.

BOURBON RED TURKEYS—Blue ribbons at Panama-Pacific, California and Arizona State Fairs, Los Angeles since 1914. Eggs for April delivery, \$5.00 per 12. Mating list. The Ferris Ranch, E. 2, 114D, Pomona, Cal.

THOROUGHbred French Rouen Duck Eggs for hatching from winners at San Jose, Oakland and Arizona shows. Also Bourbon Red Turkey eggs. Mrs. Emma V. Miller, Farmington, Cal.

BONZE TURKEYS—Young Toms for sale. No more eggs till further notice. Free circulars. Albert M. Hart, Clements, Cal.

COLORED MUNCOVY DUCKS—Quiet, quackless. Weigh up to 10 lbs. Good layers. Eggs, \$1.00 for 12. P. M. Cox, Sonoma, Cal.

CHOICE BOURBON RED GOBBLEERS—Price \$7. Edward Mulick, Willows, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

THE FOUNDATION HEN.

Unretouched Photo, 4th Prize (Utility) Rhode Island Red Hen, P. P. I. E. Poultry Show, 1915, 235-295 egg type. In 1915 she laid 100 eggs the first 4 months which hatched 94 chicks in incubators. The remaining eight months she laid 120 eggs, and

220 eggs in twelve months her second year. Bred and owned by Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

Young stock from this hen have been shipped to Hawaii, Midway, Philippine Islands, New Zealand, and Central America.

QUESTIONS AND ANSWERS:

[By Susan Swaygood.]

Lame Rooster.—I have a rooster that has had scales on his legs and now his legs are swollen up so he can hardly get around. Could you tell me what causes this scale, what would cure it, and what to do for the swelling?—O. R. R.

Being as you are far enough away I dare tell you the truth, otherwise I might temporize. The cause of scaly legs in chickens is a small insect that gets underneath the outer skin of the legs; but in all cases I ever knew the cause of the insects being there was a filthy condition of the hen house, yard or wherever the chickens run, so you see it is a case for prevention rather than cure. It can be cured, but prevention is easier. Wash the legs in good warm water and laundry soap. Scrub well, no matter how sore they are, then anoint the legs with carbolated vaseline into which you mix a little flowers of sulphur. The bird will be all right once he is rid of his tormentors.

Ducks Won't Lay.—Please tell me why my ducks won't lay at this time of year. We feed them well, shut them in a lot at night to be sure they don't lay away.—R. P. W.

You say you feed them well, but you don't say how well; there must be something lacking as this is the natural time for ducks to lay. Are you giving them any animal food? If not, do so and you will find that is the missing link. Ducks must have animal food or you get few eggs.

Incubator Turks.—Could you tell me something about little turks hatched in an incubator—how to care for and feed?—Mrs. S. J. F.

Keep them about as warm as you would chicks, but give a little more liberty. Leave out all chick feed, and just feed hard-boiled egg, chopped onion top or lettuce. Mix a little cornmeal in clabbered milk, adding a little red pepper. The great thing to remember in feeding young turks is to feed very light, never cram them; they digest their food slowly and must have exercise.

FREE NEW BLUE BOOKLET.—State, Government and Indian Lands. Bargains overlooked. Joseph Clark Sacramento.

560 ACRES Celebrated McFarland Alfalfa acreage. Water developed. C. H. Stiles, McFarland, Cal.

640-ACRE MONTANA HOMESTEADS.—New law. Circular free. Bureau 27 Boulder, Montana.

Chalmers 7-Passenger Touring Car—Price \$1350 Detroit

Full Value for Every Dollar In this Chalmers, 7-Passenger Touring Car

Scan the list of other 7-passenger cars for the equal of this Quality Chalmers. You will not find it. Only in this Chalmers are combined so many real values. You may pay \$300 to \$500 more and find nothing better.

Only a builder of long experience and with a yearly output of thousands could produce this car at so low a price. Only thus can quality of materials and of manufacturing be combined with economy of production. Because Chalmers does this is the reason why this Chalmers 7-passenger Touring Car has no competition at anywhere near its price of \$1,350.

These Prove Quality Claims

Chalmers claims a motor of unexampled smoothness, of unusual power. Prove it by examining Chalmers Lynite pistons, 1/3 the weight of the usual cast iron. These give smoothness, less strain on bearings, admit of higher power. Compare the Chalmers crankshaft with others. It is one-piece, special steel, drop-forged, balanced in motion to a fraction of an ounce.

See the Chalmers Transmission

Gears are crucible nickel steel, case-hardened and heat-treated. They shift easily, without clashing, and properly used are practically in-

destructible. The Chalmers type of dry-plate, disc clutch is far in advance of other designs. Chalmers rear axle is the same as used in expensive foreign and American cars. It is silent, efficient, economical.

A Big Beautiful Body

Big—122 inch wheelbase. Beautiful—because graceful in form, hand-finished in Chalmers shops upholstered in genuine pebble-grain leather, with new Scotch "fluted" finish. Auxiliary folding seats, Pantasote top, curtains open with the doors, fasteners are the "lift the dot" pattern.

Compare Quality—and Price

Think how great the difference between this quality Chalmers and other cars. Realize what unusual value is here offered. You will go much higher in price before you will find any other to please you so well. And all these claims we submit for your decision. Come—try the car. Investigate. Then only can you decide.

Mrs. Best's Letter.

NEW SPRING HATS.

Dear Friends: As one always thinks of hats with the coming of spring I thought you might be interested to know what the shops are showing now. Cheerful news to all is that there are many different kinds and very similar to last summer so that if you have a becoming shape or a hat that merely needs freshening you are in luck. Get out your old millinery and take stock of it. Black hats are very good style so if you have a sunburned or faded hat buy a bottle of Blak-it or some similar preparation, follow directions and you will be pleased with the results. Feathers, quills, and wings are used for trimming as are also small bunches of gay flowers or flat roses. A gasoline bath might revive such evidence of past glory so as to be used again.

I will describe several hats that were displayed so that you may have a definite idea of them.

There are turbans, black and shiny, of stiff straw very tailored in appearance that are trimmed with wings on the crown. Also there are simulated turbans where the brim turns up abruptly to the crown with a flare out at the back or side, a single flower or cluster on the flare furnishing the decoration. Some of the turban shapes have a fringe of narrow feather standing up from the crown, while others have a wing-like effect of silk or ribbon or horse hair, a couple of inches wide, extending all around the crown, or on one side tilted, or at the back.

The sailor shapes are still popular. The accustomed sailor of small crown and knife-like edge in bright colors and black and white is shown for tailored wear, merely trimmed with a band and flat bow of ribbon. In dress hats the crowns of hemp hats are removed and horse-hair crowns inserted. Around the crown lies narrow velvet ribbon which is tied into a graceful bow in back. Or bright flowers and ribbon combined around the crown make the hat gay.

Nunidie, which is a soft feather, is used placed flat on the brim, or around the crown, adding height.

Leghorns and Milans are seen again in flat and droopy shapes. Most are large with the brim or crown or both brim and crown covered with Georgette crepe in light shades. These are dress hats and the trimming is very dainty and pale. Yellows, greens pinks and blues are becoming and are used singly or in combination. Wreaths of tiny roses are placed around the top of the crown, or narrow ribbon is made into rosettes which placed around the crown are joined by the ribbon running up in points on the crown.

Dainty old-fashioned lace covers some of the brims in a soft ruffle, a narrow beading resting against the crown. These hats may have small crowns or high crowns. They usually droop and sometimes are wired under the brim so they may be made to droop becomingly.

The three-cornered hat is still here. One that I saw was brown with small bronze wings tacked into the three points. It fitted the head

closely and had a plain mesh face veil of brown to be worn with it. Another had ribbon on the top of the crown that ran out in points on the turned-up sides. Another had roses closely sewed to the crown and one of the long loose veils was displayed with it.

Tam-o'-shanters are very nifty for girls. There was one of blue shiny straw that had a large big curled quill that was inserted into two slits on the top of the crown.

A very dressy hat of brown hemp, the crown and brim covered with tan silk, was turned abruptly up on the left side and a cluster of tan quills nestled in the recess.

There are hats that turn up all around with a slight roll. I saw one of black braid brim and blue silk top trimmed with a single rose on the front. Another of the same shape was of dark brown braid and brown satin. Ornaments were made of the combination of materials and put on the crown. Then there was a dear little black crepe hat that turned up all around that had strips of tiny buds of bright colors running from brim to crown on the underside.

The black puritan style is still good. Some are just trimmed with a broad ribbon and buckle catching the ends in front.

Rosabella Best.

TO HANG DRAPERIES.

Portieres to be correctly hung in a doorway should be made just the length of the door, folding the top back and stitching it just as though there were to be a rod run through. This gives a good finish and provides a place in which to run a tape to draw up the width of the curtain to just the width of the door. For the hanging, get a narrow metal track on which slide metal discs with eyes in them. This track is to be fastened on the inside molding of the door, with the discs hanging down. With this outfit come brass hooks to be sewed at intervals in the stitching in the top of the curtain as many hooks as there are discs. Then slip the hooks into the eyes of the discs and the work is done. The curtain hangs absolutely true on account of being drawn up on the tape and can be moved back and forth with much ease.

TO SET COLORS IN GINGHAMS.

To set the colors in gingham and other fabrics at the time the shrinkage is done, use the following: to 1 gallon of water add half a cup of mild vinegar, or 2 cups of salt, or 1 tablespoon of powdered alum, or 1 tablespoon sugar of lead (poison). In most cases, allowing the mate-

rial to soak several hours in the liquid is sufficient, although with salt and vinegar solution, no harm is done if the material soaks over night. The material should be thoroughly dried in the shade. Vinegar is best for pinks, brine for black and reds, sugar of lead for blues and browns and alum for greens, lavenders and purples.

To freshen colors, soak garment in a weak solution of borax before washing.

THE SEWING MACHINE.

Perhaps the most helpful article in the household for the wife is the sewing machine. It is a time saver as well as being less of a strain on eyes and muscles than hand sewing.

To get the best results it should be kept well oiled and clean. The use of the attachments can make the sewing much easier and also more effective. It may take some little time to learn how to use them, but the time is well spent, as the work goes on so much more rapidly when hand work is eliminated.

THINGS WORTH KNOWING.

In washing a crown of lamb, a piece of fat pork placed on the top of each rib will prevent it from becoming too brittle while in the oven.

The easy way to clean a clogged grater is to grate dry bread through it.

Boiled eggs are much easier to handle if they are placed in a small strainer and then placed in the pan in which they are to cook.

Rich soda biscuit, split in half, well buttered and covered with jam or preserved fruit, make a good quick shortcake. Cream is a great addition.

When pushing curtain rods through freshly laundered curtains, put a small thimble over the end of the rod. This prevents tearing the curtain.

Frayed pieces of cloth for cleaning often clog drain pipes.

BROWN BREAD.

Mix 2 cupfuls of sour milk, 1 cupful of sweet milk, 2½ cupfuls of Indian meal, 1 cupful of Graham flour, ¾ cupful of molasses, 1½ teaspoons soda and 1 teaspoonful of salt. Stir well and steam 3 hours in a buttered mold. Baking powder or straight coffee cans with tin covers answer the purpose very well.

TO CLEAN BRASS.

Rub with fine powdered pumice and sweet oil, washing and polishing afterwards, or make a paste of oxalic acid and whiting, keeping in a closed box and wetting with hot water when used.

BANANA CREAM PIE.

Scald 2 cups of milk and stir into it ¾ of a cup granulated sugar and ¼ of a cup cornstarch and ¼ teaspoon salt well mixed. Let it cool a little after it is smooth and thick and then after slightly beating together 1 whole egg and 2 egg yolks, add them to the mixture. Flavor with ½ teaspoon vanilla. Line a pie tin with pastry and fill with the custard. Have the oven hot to begin with and then lessen the heat to avoid boiling. When the pie is baked, slice 2 bananas over the custard, covering immediately with the meringue made of the 2 egg whites, 3 tablespoons powdered sugar and ¼ spoon vanilla. Brown delicately.

Good Health.

[By H. E. Pastor, M. D.]

Horrors! Cutting 'Em up Alive!

An agitation is on foot in this State at the present time having for its object the obstruction of State legislation authorizing the practice of vivisection under proper restrictions. Some people are born chronic obstructionists—like the Irishman who, on landing in New York and being asked his politics, asked in turn, "Have yez a guvermint?" "Why, certainly we have," answered his interrogator. "Then, be jabbers," responded Pat, "I'm agin it." Pat has plenty of imitators, and science has been opposed at every step of its slow and laborious progress by constitutional objectors.

Now, vivisection may be defined as the practice of dissecting live animals in the interest of medical science. It is denounced by its critics as being a cruel and unnecessary practice. Let us see. Pasteur experimented on living animals with a view of reducing the horrors of hydrophobia, with the result that in the 12 years after completing his experiments 16,213 persons were treated at his institute in Paris with a mortality of only one-half of one per cent. In former times smallpox was a scourge before which stricken mankind stood as helpless as if before grim Death itself; Jenner, by experiments on animals, produced a vaccine that is said to have saved from death by smallpox enough people to populate the world. We cannot go into particulars here in our allotted space, but it may be mentioned in passing that the antitoxin that controls that malignant disease diphtheria; that the mitigation of yellow, malarial and typhoid fever; that the antitoxin that renders man and beast alike immune against lockjaw; that the prospective control of cancer, tuberculosis, and the most dreaded of all venereal diseases—all these are due to scientific experimentation on animals of one kind or another—guinea pigs, dogs, rats, and others. The late epidemic of infantile paralysis led to extensive experimentation on monkeys, which has thrown much light on this dread disease, and promises satisfactory results. Why sacrifice children to save monkeys? Why should we shudder over the sacrifice of a few or even many animals when millions of human lives are rescued thereby? While it is admitted that some suffering is inflicted in these vivisectional practices, it is not done for the lust of inflicting pain, but for necessary and justifiable ends. The pain incident to this practice is no greater nor is it more cruel than that involved in dehorning a cow, or branding a steer, or castrating a boar, or spaying a sow, or caponizing a rooster. Man is given dominion over the lower order of animals by divine law, and in his relations with those animals, whatever procedures are necessary for man's behoof, whether for sustenance or for exemption from disease are proper and justifiable. Most of those who oppose vivisection, conducted scientifically and conscientiously, are either ignorant obstructionists or silly sentimentalists.

Sub-acid fruits are more wholesome than fruits strongly acid.

Big Ben

A
Westclox
Alarm

SEVEN A. M.—**BIG BEN** at his best—opening little folks' eyes—there's a race to hush him—a pillow battle—merry laughter—and mother to tidy the kiddies for school.

For the rising generation there's no better get-up. Big Ben's little men bubble health and cheer, and they feel as big as Daddy with a clock all their own.

He gets 'em to school long before the last gong and this habit lingers when the children grow up.

You'll like Big Ben face to face. He's seven inches tall, spunky, neighborly—down-right good.

At your jeweler's, \$2.50 in the United States, \$3.50 in Canada. Sent prepaid on receipt of price if your jeweler doesn't stock him.

ROTTING BULBS.

I received the following communication this week, which I think will be of interest to my readers:

"Some anemones (St. Brigid) and almost all varieties of tulip (Rev. Eubank, Gesueriana lutea) have putrefied in the soil where they were planted the last fall. These bulbs were bought in San Francisco. All bulbs started to grow at first, but when they had grown about two inches long from the top of the bulbs, the insides of the bulbs were putrefied, and many insects were in them—while the young shoots are not dead yet. I think this is not the result of using strong fertilizer, for we did not use any; or the cold weather, because the young growth is alive longer than the bulb itself; or caused by any insects, as they were hatched after the putrefaction."

In answer to the above, would state that in my opinion they were imported bulbs, and owing to the war were a long time on the way, and were heated in transit by being too close to the boilers of the vessel, or heated of their own accord on account of long packing. I have not used the imported bulbs for a number of years, owing to the uncertainty of their flowering when forced. There are several firms on the Pacific Coast who are growing better bulbs at a less cost than the imported ones. There are several growers in Santa Cruz, also a number up in Washington State; and C. W. Ward of the Cottage Gardens Nursery has started an enormous plant at Eureka for the growing of numerous varieties of bulbs; also azaleas, rhododendrons, and a lot of other stock that is usually imported from Holland, and they are meeting with great success.

Of course all varieties of bulbs cannot as yet be grown successfully on the Pacific Coast. Most of the earlier flowering tulips, hyacinths, lily of the valley, Roman or miniature hyacinths, and a number of other varieties of bulbs are still imported; but you can get the Darwin and Gesueriana tulips grown here; also gladioli, fresas, narcissus and daffodils in all the varieties—ixias, Spanish iris, jonquils, etc. There is no way you can tell whether a bulb has been heated or not when you get it; it generally comes blind, or starts to rot when planted. My advice is to get Pacific Coast grown bulbs whenever you can, and you will not be disappointed when you plant them out. I handle and grow nothing but the home-grown bulbs, and get the best of results from them year after year.

Good mattresses should have cotton covers to protect them from dust and soil.

This is the Roof Covering You Want

Everybody Praises It—**ELASTIC-GUM-COATING** is just the thing for covering roofs—Cheap and Efficient. Here is just the roof covering every California home owner should have—**ELASTIC-GUM-COATING**. Open Sundays and Evenings

SAN FRANCISCO.

San Francisco, March 14, 1917.

WHEAT.

There was a general advance on all offerings during the past week, although the market showed some signs of easing off at the close—due to apprehension that the threatened railway strike might become a reality. Trade in futures has been marked with slightly firmer prices on the December option, but trading has been of small volume.

Sonora wheat\$2.80@2.85
Northern clubNone offered
Calif. Club, cti.2.75@2.80
Northern Bluestem3.05@3.10
Northern Red3.30@3.20

BARLEY.

Barley quotations have been without change during the past week, although some houses were reported to be trying to get a small advance on red feed stock.

Seed, cti.\$2.50@2.60
Shipping, cti.2.35@2.40
BrewingNominal
Choice feed, cti.2.25@2.30

OATS.

A scarcity of first quality stock and a decidedly larger country demand combined to bring higher prices on all varieties of oats during this past week. Red Texas seed oats is now being generally held at \$3.10 per cental, although the buyers of large lots have secured a ten-cent reduction from this price. The export demand was only normal but futures business is active.

Red feed\$1.90@2.00
White2.05@2.10
Red seed (Texas)3.00@3.10

CORN.

The fancy prices being paid for hogs at the present time have led to a big call for corn here, the owners evidently figuring that the figure now paid for fat stock is such as to warrant the feeding of this expensive product. Northwest buyers were also in evidence here and quotations on corn were advanced 15@17½ cents per cental. [First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, cti., bulk\$2.30@2.35
California, sacked2.30@2.40
Milo Maize2.15@2.35
Egyptian2.35@2.40

BEANS.

While quotations on most varieties of beans have been advanced here this past week, it is very much of an open question in the minds of local dealers whether these gains will be held. The calling of a general railroad strike will mean sky high prices in the East for beans, and a big drop here because of the inability to ship goods out. Already the freight situation is so bad as to be the cause of general complaint, one house having received word that a car of beans which left here ninety days ago has reached El Paso, and that the railroad company hopes to move it again next week. For the last couple of days, business with houses East of Salt Lake has been at a standstill as none of the firms care to tie up their money in cars that may not leave San Francisco for several months. Some export business was reported, with limas and blackeyes the most favored varieties.

HAY.

Still further advances on most grades of hay were reported for the past week, with light offerings the principal factor in this. During February of this year 7050 tons of hay were delivered on this market, as compared with 12,757 tons for the same month last year. Receipts for last week were 1045 tons, a gain over the 746 tons of the preceding week, but this was largely offset by a larger export call. Holdings in dealers' and consumers' barns here and in country public warehouses and farmers' barns are the lowest ever reported for this season of the year. Crop prospects are all that could be asked for, although buying here for feeding at interior points is still noticed. Alfalfa hay and straw are both scarce and in very good demand.

POTATOES, ONIONS, ETC.

Spring vegetables are fast becoming a factor in the local market, with asparagus commanding the most interest at present because of its newness. Cold weather has held back this crop, and it is not expected that car lots can be shipped East before March 20,

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

against March 9 for the shipping date of the first car in 1916. Local receipts are running about 100 boxes per day, and are selling at prices that should net the grower 12½@30 cents per pound, depending on grade. The first car of rhubarb went East last Monday and increased offerings have brought a drop on this offering here. Lettuce fails to command as high prices as last week because most shipments show the effect of frost. The potato market seems to have definitely broken, largely due, it is said by local dealers, to an unannounced boycott on the part of the Pacific Coast housewives. Onions are also lower, with continued receipts of Japanese stock promising to further break the market.

POULTRY.

The offering of Eastern poultry in this market put a stop to the big demand for California hens this past week, and this line was moving at easier prices. Young fowl continued scarce and steady as to price, but any increase in arrivals is sure to be followed by a break.

BUTTER.

Last weeks break in butter prices led to a better shipping call, and the entrance of firms having Alaska contracts here helped to bring a rally. With the Eastern markets holding steady, no change of great moment, either in the nature of a decline or advance, is to be expected until grass butter arrives in large quantities.

EGGS.

The local egg market has held up surprisingly well in the face of increased receipts, thanks to a brisk shipping call. The bulk of this is from Northern sources and the lots are ultimately intended for Alaskan consumption, with the East buying considerable stock outright in this market. The increase in offerings has increased much more than local receipts would indicate, as many of the local dealers are trading quite heavily in car lots at Petaluma, the stock being intended for storage at Los Angeles. Storing in local ice houses has been only nominal so far this season.

NEXT POTATO CROP LIKELY TO BE LIGHT.

Reports from various parts of the State indicate considerably greater acreage planned for potatoes in the smaller-producing districts and large amounts to be grown in a multitude of small plantings, but all the news we can get from the Delta district seem to indicate not much greater acreage than last year. Growers have until June to make up their minds and seem in no hurry. Beans seem to many growers as promising as potatoes, and they cost about one-fifth as much for seed, so many acres will grow beans rather than potatoes unless seed of the latter comes down materially.

The feeling is general that prices will not be much lower until new potatoes come down in June. Canadians are alarmed lest they will not have seed enough; we are importing from Australia; Eastern U. S. is paying \$2.50 to \$10 per bushel for seed potatoes; and it was reported that on Mar. 1 there were only 1200 cars left on the Coast. Geo. P. Weldon of the State Horticultural Commission fears great reduction of the average crop per acre in 1917, due to use of inferior and diseased seed.

HOPS.

Trade in hops has been featureless during the past week. While some curtailment of acreage is reported for Oregon, present indications are that California will raise nearly as large a crop as was produced last year. Quotations remain unchanged.

LOS ANGELES.

Los Angeles, March 13, 1917.

Receipts of week ending Mar. 13, 1917—305,730.

Receipts of week ending Mar. 13, 1916 357,450.

The market the past week was without feature. More rains and improved conditions of pastures, promising an early increase in production, caused a weaker feeling. But in the absence of stocks last week's closing prices maintained up to Monday, when a number of sales of extras were made on call at 32½c, a decline of ½c, though before the close the market worked back to 33c. Chicago and New York held steady throughout the week at last week's closing prices, 40c for extras in Chicago and 40½@41c for extras in New York. Receipts for the week were not heavy and were pretty well taken care of by the consuming trade, though the market was a little heavy towards the close of our review week. Tuesday there was no change in the Chicago market. On call only one sale in boxes of extra cut and wrapped at 33c.

EGGS.

Receipts (railroads) for week ending Mar. 13, 1917—2918 cases.

Receipts (railroads) for week ending Mar. 13, 1916—4271 cases.

A rather firm market and fair demand was had the past week. Receipts, while very good, were all wanted by the consuming trade or storage buyers and prices ruled much the same as at the close of our last review. Monday, when in sympathy with declines East, prices went off ¼@½c, but at the decline the demand was good. While prices are lower than a week ago they are still 6c higher than this time last year. Chicago declined 2½c on first, and New York 7½c on first. It was this shrinkage in values that caused the market to break here. Tuesday there was a further break in the market. Receipts were not heavy, but with the Eastern markets sharply lower since last week the disposition of buyers here was to bear prices. Extras declined ½c, case count 1c and pullets 1c.

POULTRY.

Fairly active and firm market was had the past week. No Eastern poultry in and local arrivals only fair. This with a strong demand from the hotels and restaurants to satisfy the tourist demand, causing dealers to bid up for everything, hens, young stuff, turkeys and ducks all moving without trouble.

We quote from growers:

Broilers, 1½ to 2 lbs.32@33c
Fryers, 2½ to 3 lbs.28c
Hens over 4 lbs.22@23c
Hens, under 4 lbs.21@22c

Turkeys, light24@25c
Squabs, live, per doz.\$1.50@3.00
Dressed3.75@4.85

CABBAGE AND CAULIFLOWER.

A draggy and weak market was had the past week. Receipts of cabbage were fair, but the quality was poor. But little of it fit to ship. Good firm cabbage if here would have sold fairly well at quotations, \$2@3 per cwt. Cauliflower like cabbage met with a poor market. Most of the arrivals were not fit for shipping. Season pretty near over. What little buying done was at \$1.20@1.30 per standard crate to growers.

HAY.

A more quiet and weaker market was had the past week. Receipts were much better and the high prices caused buyers to hold back and go slow. Dairymen, too, feeding more green stuff and pastures better all of which had its influence upon the market.

We quote f. o. b. Los Angeles:

Barley hay, ton\$20.00@22.00
Oat hay, ton21.00@23.00
Alfalfa, northern, ton18.00@19.00
Alfalfa, local, ton21.00@22.00
Straw, ton11.00@12.00

BEANS.

The market brightened up the past week and there was a good demand.

Limas were advanced \$1 per cwt, and pinks 75c@\$.1, under buying from the country for seed. The consuming trade was inclined to hold back at these prices.
We quote from growers:

Limas	\$13.00@15.50
Large white	12.00@12.50
Small white	12.00@12.50
Pinks	9.00@9.50
Blackeyes	7.50@8.00
Tepary	5.75@6.25

Special Livestock Market Report.

San Francisco, Mar. 14, 1917.

CATTLE are still scarce and steers are marked up a quarter. Some stock is coming from packers' feed lots in Nevada and a few cars of cows came down from Oregon last week.

Steers, No. 1	9 1/2 @ 9 3/4 c
No. 2	9 @ 9 1/4 c
Cows and Heifers	7 @ 8 c
No. 2	7 @ 7 1/2 c
Bulls and Stags	6 @ 7 c
Calves, light	9 @ 9 1/2 c
Medium	8 1/2 @ 9 c
Heavy	7 @ 8 c

HOGS are all marked a half cent higher than the record prices of a week ago and the end is not yet seen. There is promise that high prices will stay a long time, and wise farmers are sacrificing none of their good breeding stock. All local arrivals are from California and they are scarce. Yet, while the high prices tend to hold back some stock because it is now profitable to feed the high priced grains, it is noticed that many underfinished pigs are being sent to market in apparent fear of a break. Not so many No. 1 hogs are being marketed.

[Rough docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]
100 to 150 lbs. 12 1/4 @ 12 1/2 c
150 to 300 lbs. 13 1/4 @ 13 1/2 c
300 to 375 lbs. 12 1/2 @ 13 c

SHEEP: There is nothing to say about sheep because there is no slaughter stock in growers' hands to talk about. Prices are nominal for lack of stock movement.

Prime Wethers 10 1/2 @ 11 c
Ewes 8 1/2 @ 9 1/2 c
Lambs 12 1/2 @ 13 1/2 c

WOOL: The spring clip is on. Most of it was sold on the sheep's backs; though at least one district, Mendocino, seems unmovable. Cloverdale offers are 45 cents, and Oregon 40 cents. Everything else was nearly "sewed up." Sacramento Valley, spring clip. .39@40c
Mendocino, year's Nominal
Southern, spring clip 28@30c
Southern, 7 months 15@18c
Imperial Valley, 7 mos. 14@15c
Nevada, year's 31@32c

HIDES are still nominal for lack of movement.

Steers	23 @ 25 c
Cows	23 @ 25 c
Light hides, 25 to 48 lbs.	25 @ 26 c
Kip	20 @ 22 c
Calf and veal	29 @ 30 c
Dry Hides	32 1/2 @ 33 1/2 c
Dry Kip	35 @ 36 c
Dry Veal and Calf	38 @ 40 c
Pelts, long wool	\$3.25@3.50
Short wool	1.25@1.50
Horse hides, wet, large, ea.	5.00@5.50
dry, large	3.00@3.50

Los Angeles, March 13, 1917.

CATTLE: While the market the past week was firm there was no especial life to the trade. The continued high markets East are making feeders rather independent and except where their cattle are ready to come forward, are inclined to hold for higher prices. The supply continues to come from California and Arizona and some very good cattle were in during the week. Killers were all in the market, but while wanting supplies, were not anxious buyers, though took what cattle offered at old prices.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$9.00@9.50
Prime cows and heifers 7.50@8.00
Good cows and heifers 7.00@7.50

HOGS: There was another sharp advance in this market the past week. The sensational prices now being paid on the Chicago and Kansas City markets caused packers here to bid up to keep them from going East. Receipts during the week were not large, but some very good hogs were in, though mostly light weights. California and Arizona furnished most of the supply. Packers were all in the market and offerings were disposed of without trouble.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. \$11.00@11.50
Mixed, 200@250 lbs. 11.50@12.50
Light, 175@200 lbs. 11.50@12.50
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: The offerings continue light and the market remains firm under scarcity. Utah and Idaho furnished most, with a few small lots from California. Killers all wanted supplies and bid freely for what few were on sale, but refused to advance prices, which are thought already too high. Yet the market is firm.

Per cwt. f. o. b. Los Angeles:
Prime wethers \$9.00@10.00
Prime ewes 9.50@10.00
Yearlings 9.50@10.00
Lambs 13.00@14.00

CALVES: Offerings very good and market rather slow. Prices unchanged, selling at \$8.50@9.50 per cwt.

No. Portland, Ore., Mch. 12, 1917.

CATTLE: Today's receipts were rather small—only 1400 head. Demand from large packers was rather small, due to the heavy receipts of last week, but there was a good demand from local and coast butchers, who took their supply early at steady prices. The bulk of the day's trade was on a 10 to 25c basis. Best beef steers brought \$9.50 to 9.65; with very good kind at \$9.25 to 9.50. Good steers sold from \$8.55

to 9.00; with medium kind at \$8.25 to 8.75. Best cows sold at \$7.50 to 7.75; with very good stuff going from \$7.10 to 7.25. One prime heifer brought \$9.00 with a few other sales from \$6.75 to 8.00. The bulk of the good bulls

Special Citrus Market Report.

Los Angeles, Mch. 13.

Shipments of citrus fruits from Southern California from November 1 to March 11: Oranges 11,163 cars and lemons 2161 cars. Same time last year: Oranges 9165 cars and lemons 1975 cars. Shipments from Central California from November 1 to March 5: Oranges 4035 cars and lemons 161 cars. Same time last year: Oranges 4191 cars and lemons 140 cars.

With more favorable weather and frost damage reported in Florida, the markets at the East the past week did a little better both on oranges and lemons. Buyers took hold more willingly and bid a little stronger for the best known brands of highly colored fruit. Poor stock, however, showed no improvement. Shipments from Southern California for the week were 1486 cars. Shipments of lemons from Southern California for the week were 158 cars. It was this falling off in shipments rather than any improvement in the demand that caused a stronger tone to the markets East.

Locally the market shows no change from a week ago. Of course Orange Day brought a very good demand for the time being, but since the opening of the current week packers have

sold from \$6.50 to 6.75.

HOGS: Hog prices continue to go up by leaps, an advance of 50 to 75c being made today. Three loads of prime heavy hogs bringing \$14.35 with several bunches at \$14.25; the balance of the run was taken at \$14.00 to \$14.10. Pigs advanced 55 cents, bringing from \$12.55 to 13.35.

SHEEP: The sheep receipts were rather small, only two loads being received; demand was light and prices steady. One load of wool ewes brought \$9.75, a load of shorn wethers at \$10.00. There have been no lambs offered here this week; sheep are being quoted at \$12.90 to 13.10.

brought rather sparingly. The popular size highly colored oranges met with a very fair demand at 1@1 1/2c per pound in the grove picked, but others slow sale, the market still being full of culls which are cheap. Grapefruit in fair demand at 1 1/4 @ 2c in the grove picked.

AUCTION SALES.

New York, March 12.—Sixteen cars navel and two cars mixed oranges and three cars lemons sold. Market higher on oranges and lemons. Weather fair. California navels averaged \$2.00 to \$3.80. Lemons averaged \$2.75 to \$3.40.

Boston, March 12.—Sixteen cars oranges sold. Market stronger and higher on both oranges and lemons. Califor-

All the year around tractor

THE SPRING RUSH is the busy season for Yuba tractors—no time for adjustments, not a moment to be used in making repairs. The busy plowing season is a test of the stamina and sturdiness of the Yuba.

But no matter how successfully a tractor comes through this endurance test, it is not necessarily a good investment. The spring plowing season does not last long.

If the tractor is to make good as a year in and year out investment, it must do more than the plowing. It must have the power to pull a harvester, the steadiness to drive a thresher or a pump, the speed for light discing or harrowing and the flexibility for road hauling.

The Yuba meets these conditions. It is an all-year-around tractor. It combines sturdiness and versatility. It replaces all your horses.

BUY A YUBA

Just Back from Town with his New FISK NON SKIDS

And a wise buyer is he who makes his tire equipment Fisk throughout. Thousands of to-day's users of complete Fisk equipment began years ago with a purchase of a single tire.

When you pay more than Fisk prices you pay for something that does not exist

THERE is no better tire quality—no greater mileage—and one set of Fisks will prove that you can't make a better dollar-for-dollar tire investment. If you don't know Fisk Tires, buy one—put it to the test and learn the Fisk standard of tire value. It will be more than worth your while. The price of Fisk Non-Skids is actually less than the plain treads of several other standard makes.

A special feature of Fisk Tire Value is the policy of Free Service through Fisk Branches in more than 125 principal cities throughout the country. There are Fisk Branches in your state, where your home dealer buys direct and is always sure of promptest attention to your wants. And when the Branch is convenient you can go there any time, *whether you use Fisk Tires or not*, and make use of the only uniform and complete Free Tire Service in the country. There is no charge at any time except for supplies and actual repairs. Take the first opportunity to get acquainted with *Fisk Service*, Fisk Organization, Fisk Methods and Fisk Products.

Time to Re-tire?
(Buy Fisks)

If you do not find a Fisk Branch in the partial list below that is convenient to where you live, write for complete list—there may be one nearer you.

THE FISK RUBBER CO.
of N. Y.

General Offices: Chicopee Falls, Mass.

Fisk Branches in San Francisco, Oakland, Sacramento, San Jose, Fresno, Los Angeles, Riverside, San Diego, Hollywood, Pasadena, Reno, Portland, Tacoma, Seattle and Spokane.

Community Building With a Dairy.

[Written for Pacific Rural Press.]

WHEN the LeBarron Est. Co. took over the management of the 200-acre dairy ranch known as the "home place" in 1915 they had several objects. The place had been rented for 25 years; and the tenants had badly overstocked the land and let the fences and buildings run down. When the lease expired in 1915, it was either a case of fixing up the fences and buildings and re-leasing to a tenant who would further run down the soil on the place, or fix things up and run a dairy themselves, with an intelligent soil-building policy in mind. Rational means of restoring fertility were devised and practiced.

Besides the 200-acre ranch, they were large owners of other dairy land in the district and also heavily interested in the local bank. For these reasons they consider that what is good for the dairy industry in the community must eventually be good for themselves; and it was more on this account than with the expectation of making their dairy pay better rent on the "home place" that they decided to manage the place themselves.

Former tenants had virtually "dairied" the soil to death, however surprising that statement may be to those unfamiliar with the locality. As is customary on most dairies of the section, the tenants had farmed only the lower, more level lands because of the tendency of the steeper hills to wash badly during the winter, when plowed and planted to grain or other field crops.

The lower land was continually cropped to hay, with a consequent reduction of fertility which might have been partially overcome by systematic distribution of manure and rotation of crops. But the average tenant in the district considers manure a liability rather than an asset because it has to be hauled, so the land got little fertility from that source.

The hill pastures also became poorer year by year because they were overstocked, the practice being to keep enough cows to consume every spear of grass in the spring season when the grass was growing. This did not allow the grass a chance of going to seed; or at best a very small amount of it, and resulted in a decrease of grass each year.

Good Cattle.—But fertility is not the only improvement contemplated by the LeBarron Co. on their own and neighboring ranches. They realize that the increasing cost of dairy operation demands a better-producing cow; and with that end in view, they have established a herd of purebred Ayrshire cattle; not expecting other dairymen to do likewise, but with the idea that more purebred bulls will be used on the grade herds as a result of their experience. It is interesting to learn from one of the firm that while dairymen a short time ago were looking for cheap bulls, and

the cheaper they were the better they liked them, a good many are buying purebred sires now and evincing a desire to breed higher producing cows.

Better Building.—With the demand for better farming and better breeding in the section has also come a demand from the market side for a better quality of cream and dairy products to secure the maximum price. To aid in this respect, one of the first works of the company was the construction of modern dairy buildings. The old barns on the place were utilized in the construction of the milking, calf and hay barns, all

three of which are connected with each other to insure convenience as well as sanitation. The milking barn provides for two strings of cows, having a well-drained concrete floor and good light and ventilation. Adjoining the milking barn and connected with it by an inclosed passageway is a well-lighted and ventilated milk room, also having a concrete floor and protected from flies by liberal amounts of screen. A steam boiler operates the separator and furnishes hot water for the washing of utensils. Besides the protection furnished the cows by the milking barn from the cold and wet weather of winter, long shelters have been built in the pastures. These are sided up on three sides and allow shelter from the weather at all times.

Restoring Fertility.—While it is still too early to show much progress in the fertility building scheme, an outline of the work started will give the reader an idea of what this company has undertaken. They are inaugurating a very different method of pasturing the hill land. The first year they had possession of the ranch they had only ten cows on it; and while in previous years the hills had been barren after the pasturing season, that year there was a heavy growth of bur clover all over the ranch. This was allowed to go to seed as well as most of the other wild grasses. A much heavier growth of grass is anticipated. Cross fencing is another subject which will be given consideration, as it will

permit better pasture regulation. Still another change of practice will be to keep the cattle off the pasture lands till rather late in the spring, giving the grass a chance to grow. It is reasoned that supplementary feeds have to be furnished the cattle anyway for year-round milking; and that it is poor economy to hurry the stock onto the pasture as the same amount of feed would have to be furnished later anyway; and the grasses suffer materially.

Last year being an extraordinarily dry one, some of the experiments in farming the lower lands did not turn out very well; but in normal

THE RIGHTS OF FREE MEN.

AS WE write on Tuesday it seems to be in doubt whether we are actually at war with Germany or not. Until today there has also been some doubt whether the American people are at war with the railways and their employes or not. There should be no such doubt in either case. Of course, as citizens of the world, we are automatically and everlastingly at war with any combinations of people at home or abroad who declare their purposes to infringe upon our rights as freemen, or by interference with the operation of public utilities infringe upon those rights without such declaration. Nations of men abroad and combinations of men at home must be taught that neither their necessities, as they are disposed to call them, nor their desires and ambitions, give them justification for passing beyond the exercise of their own rights into infringement upon the rights of others. If there is no way to arrest infringement of our rights except to win at the wager of battle, then we are at war, until we secure from the world international law and obedience to it, or from our own people national law which shall insure uninterrupted operation of public utilities, and make unlawful any human attitude or action which shall infringe upon our right to live and move and have our being in all things which are manifestly for the public good.

Whether we are at war with Germany or not does not seem to matter much at the moment, for Germany is acting as though a state of war existed—sinking ships, plotting, spying, exploding, and what not: things which automatically make war although more safely undertaken under cover of peace and declarations of good will, if a nation has the right kind of a conscience for it—but we are not intending to hold forth on that subject this week. At the moment a by-product of the prospect of war is a more important matter than the question of participating in war.

THE RAILWAY STRIKE PASSES.

THE United States has narrowly escaped making itself a laughing stock in the eyes of the world. We have recently been reasserting with considerable eclat the principles announced by our forefathers that true government is based upon the consent of the governed while we have been for months past frightened nearly out of our industrial life by the threats of elements of our own population which have been acting as though they considered themselves ungovernable. We have been preaching the consent of the governed and tolerating refusal to be governed. The chance of war has awakened us from this ridiculous anomaly and paradox, and has, we hope, settled forever the supremacy of public right in the uninterrupted maintenance of public utility—no matter what private rights of profit or wages may be involved in the operation. And settlement has arrived along two avenues which were surveyed by the forefathers and have been made smooth and straight by their successors for

several generations—the avenues of Liberty and Law. For a week past the business of the country has been paralyzed by the threat of a general railway strike to begin on the evening of March 19. At sunrise on that day, after almost continuous session for several days, representatives of the employers and employes and mediators designated by President Wilson, reached a conclusion, and the strike passed. The employing railways conceded the demands of the employes, and Secretary Lane, chief of the mediators, praised the railroad managers "for their high sense of obligation and their unwillingness to permit any embarrassment to the country at this time of extreme strain." Thus the railways agree to pay their employes something like fifty million dollars more per year than they have hitherto, without demonstration that they were entitled to it. It was a concession to their continued operation and uninterrupted public service.

SUPREMACY OF PUBLIC RIGHT.

THE result thus reached was a leap over a wall; it was not a creation either of Liberty or Law, for, at the moment of its attainment, one side surrendered its liberty because there was then no law which had passed the highest tribunal of justice and was dependable. The addition of fifty millions a year to railway pay-rolls may necessitate reprisals on the public interest and industry hereafter. Two things are, however, assured, and they are of incalculable value: first, the strike method of holding up public utilities is dead beyond resurrection; second, compensation of employes in public utilities will be determined by law, on the basis of investigation of rights thereto. For before the sun had reached meridian after it had dawned on the employers' concession, which Secretary Lane describes as patriotic, the United States Supreme Court rendered its decision that the Adamson law was constitutional, and the Chief Justice thereof made these declarations of the supremacy of public rights:

"Whatever would be the right of an employee engaged in private business to demand such wages as he desires, to leave the employment if he does not get them, and by concert of action to agree with others to leave on the same conditions, such rights are necessarily subject to limitations when employment is accepted in a business charged with a public interest and as to which the power to regulate commerce by Congress applied and the resulting right to fix, in case of any dispute, a standard of wages, necessarily obtains."

In other words, the Supreme Court holds that "the public interest begets a public right of regulation to the full extent necessary to secure and protect it." Also that the public right to have interstate commerce uninterrupted is a basic principle paramount to interests of the railroads or their operatives and subject to the supreme, unrestricted power of Congress to take any action necessary to maintain freedom and uninterrupted of interstate commerce.

BLUE SKY FOR CALIFORNIA.

OF COURSE, every State which puts out a pound of produce or merchandise beyond its own needs, or takes in a pound beyond its own production, has its industrial sky cleared by this incomparable declaration of the supremacy of public rights, but in the line of food products California can claim unique share in the transcendent azure. California counts distance of transportation to her markets by thousands of miles, while most States count by hundreds. California counts time of transportation by days and weeks, while most other States count by hours and days. California counts values in strictly perishable classes by hundreds of millions, while most other States count in millions. California counts carload freight rates in hundreds of dollars while most other States count them in tens. And when California can point confidently to the supremacy of public rights as a surety against any threat or menace of interruption by either strike or tie-up, she has a guaranty of increased production, which for volume, variety, and value is beyond the reach of most other States, and of development of which present achievements are but a promise. As one thinks of these things and

all they indicate in population, in prosperity and in Imperial Statehood for California and her rich and beautiful sister States upon this coast of the greatest ocean that is to be, it surely spreads a rosy glow upon our circumambient blue, and fills the heart with adoration for this new demonstration of the old American endowment—the supremacy of public rights!

This may sound a little fervid, and yet one only has to think a little to realize that it has naught too much either of heat or color. In contrast with the darkness and danger of the past it is not a ray too bright. We have had trainloads of scheduled perishables side-tracked all the way across the country in the past. We have had packing houses and freight yards full of our best products—lost after all labor and expense had been expended upon them. We have had embargoes placed upon shipments of stuff in prime condition because of the doubt whether wheels could be turned or not. We have seen a year's labor and outlay lost because some private interest refused a few days' action—hardship and loss brought upon thousands for the fancied rights of scores. In the public view such things are intolerable—and now, happily it has passed for all time.

The future of California demands that all avenues of public interest shall be held open by the supremacy of public rights. The face of the earth shall be open and free from barriers of private interests; the ocean shall be open and free from the menace by desperate inhumanity; the Panama Canal shall be open and placed beyond the possibility of seizure by European imperialism; the air shall be open for flight of men and the thoughts of men, without pollution by those who aim to prey upon our peace and prosperity. And all this we claim for California, of course, as a part of the indivisible nation in which we glory—this nation which has preached the supremacy of public rights to all the world for nearly a century and a half, and has but just discovered and laid hold upon its own most important share therein!

TOMATO TURNOVER.

THIS is not a kitchen recipe snatched by the printer from a "domestic gallery," to fill the space when the writer collapsed from the preceding flight of alleged patriotism. It is a fact of public interest that tomatoes have turned over, because it explains why buyers have been so busy contracting tomatoes long before the plants could safely go from seed-bed to fields which will still be for weeks too frosty for their comfort. We do not profess to know all about it, because canning commerce and finance are about as dark to us as the inside of a can when it goes into the processing vat, and yet we must express satisfaction if the activity of contracting buyers gives our growers this year a price nearer their deserts than they usually get, and nearer what the consumer has to pay when the product is up to him. There is perhaps another comfort in the demonstration of the fact that when our greatest canning combination ever was spiked up it did not shut the grower out of all the fun of making good contracts. It seems that after the great canning squeeze had placed its wholesale price on 1917 tomatoes at 92½¢ to \$1.05 per dozen, a smaller squeeze started in and lifted the price to \$1.20 per dozen—and got away with the price and rid of the goods. The successful invader has issued this statement:

"In surveying the tomato situation for 1917 our house came to the conclusion that \$1.20 was a fair opening price. We based our judgment on the continued heavy demand for tomatoes coming

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., March 20, 1917:

STATIONS	Part Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka32	24.37	36.23	59	32
Red Bluff	00	15.67	20.04	66	34
Sacramento	00	12.19	15.96	66	38
San Francisco02	15.28	18.62	69	42
San Jose08	12.05	13.77	64	32
Fresno12	6.82	7.70	66	34
Independence
San Luis Obispo20	22.40	16.63	66	34
Los Angeles06	14.59	13.06	73	43
San Diego02	8.74	8.34	66	44

from the Eastern States and Europe and Canada, and on the heavy increase in the cost of materials used for canning. We refused to sell any portion of our pack of 200,000 cases at less than \$1.20. We held for the price and got it. Our entire pack has been disposed of and we do not look for the price to be any lower on 1917 tomatoes."

If the reasoning of the invading canner is right there may be a chance to give such a buoyant demand a few more tomatoes. This is a safer opera-

tion now than it might have been if the canning drive on tomatoes had been announced earlier, for then we might have gone short of barley because of the acreage going to love-apples. But it is pretty late now to make a new start from the seed. If, however, the seed beds are economically stretched it may be possible to increase the acreage with a good show of demand and no great risk in the investment.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Corn for Grain or Forage.

To the Editor: I am taking care of a ranch and want to plant feed corn between young vines planted 7x9 ft. The land is black adobe. A neighbor tells me that after the corn has grown about six inches it should be thinned to one stalk to each hill and I should leave two ears on each stalk for a good crop. Please tell me if that is the right way to raise feed corn.—D. P., Cloverdale.

We suppose you mean by "feed corn" a crop to be cut in the roasting ear for green feed or the silo. If so, your neighbor is wrong, and even if he were advising about growing corn for ripe grain he would be a little too radical. On good land as a result of many experiments, three stalks per hill have produced more grain to the hill than one or two stalks and when more than four stalks there is usually less grain. You do not need to thin the ears unless you are growing samples for exhibition; it will not pay for the work. But if you are growing for green feeding do not plant in hills at all but in drills or furrows, planting rather thinly so the stalks will stand three or four inches apart. For the sake of the vines do not plant the corn too close to them and keep the rows at least 30 inches apart so you can keep up good cultivation both for the sake of the corn and the vines.

To Get Rid of Rabbits.

To the Editor: Please publish a way to get rid of rabbits, as they are destroying my garden. As fast as I can plant out the cabbage they take them.—A. F. K., Ripon.

Probably you will get most peace and garden truck for the money by fencing your garden with chicken wire netting—four feet wide, six inches let into the ground. If you do not care to do that you must sit in the window at dewy dawn and eve and shoot—or undertake the rather difficult job of poisoning. Take pieces of parsnips, carrots or apples about an inch through, open a little slit in each piece with a knife blade and prick in a crystal of strychnine. Put one piece on the end of a slim splinter and push the other end in the ground, so that the bait will stick up several inches above the ground. Rabbits like clean bait and like also to pull things out of the air. You might also prick strychnine into the soft parts of the stems of some cabbage plants and plant them outside the others—just to see what happens.

Heeling-in Trees.

To the Editor: I have heeled-in a good many trees this winter waiting for planting, and I have put them on the slant as I have seen others do but I do not know why I do this rather than stand them up straight. What is the reason for the slant?—Planter, Marysville.

We are not sure that we know all the reasons, but these two have satisfied us. First it is easier to put them that way, because they hold themselves in place for covering the roots, and it is also easier for you and better for the trees to lift them out than to pull them out. Second, when putting in on the slant the tops should always point to the southern sky, because the sun is low down and its rays hit the trees on the ends and not on the sides. Activity in the tree begins from sun heat on the bark and a tree slanting to the south gets less of it than if straight up and very much less than if the slant was toward the north, which would bring the sides of the trees at right angles to the sun's rays. Therefore a slant to the south keeps the heeled-in trees dormant longer.

Pruning the Almond.

To the Editor: Should almond trees of a few years' growth have the ends of the branches cut off the same as peach trees? If pruned that way what effect will it have on the trees?—D. W. P., Escalon.

The effects of systematic pruning of the almond are similar to effects of such treatment of the peach, viz.: larger fruit and growth of more vigorous bearing wood. But such treatment of the almond is not prevalent, for two reasons, at least: the increased cost of handling the trees and the fact that, on the average, the almond is not as sure a fruit-setter as the peach and it is therefore not so safe to freely reduce its wood capable of bearing. It is also a fact that as the almond is a much lighter fruit, there is not such requirement of limiting the number of fruits to save the tree from breaking. Still there is good reason to believe that it would be profitable to prune the almond in the same general way as the peach, though probably not so severely.

Cows in Clover.

To the Editor: I have 30 acres of irrigated land near Escalon. When would be the best time to check and seed for alfalfa? How many cows would I need to net \$100 a month? How can \$2,000 be used to the best advantage on this unimproved land?—Subscriber, San Francisco.

Get after it immediately or you will be too late to get good results this spring. If you do not care to move so fast, start in checking this summer, get the land well settled, by wetting down before the water goes out of the ditches, and sow next fall. How many cows it will take to net you \$100 a month depends on you, on the cows and on the prices of butterfat. You might do it with 20; you might miss it with 50. The best way to spend the money you speak of would be to put in alfalfa and buy cows—if you know how to handle them.

Cutting Wheat to Reduce Growth.

To the Editor: I have a stand of bluestem wheat. In the beginning it was all right; but now it is altogether too heavy and thick. Neighbors tell me to cut it. What would you advise?—F. G., Calistoga.

Wheat can be mown or even lightly pastured (when the ground is dry enough) without reducing the grain crop. The result to be expected would be increased stooling—more heads on shorter stems. But this must be done before the grain is too far advanced, and it requires experience to determine that. If your neighbors have themselves done the thing to advantage they ought to be competent to advise you, for they can see what they are talking about and we cannot. To cut too late will reduce the crop.

Apples in Bad Company.

To the Editor: Winter Pearmain apples are standing 18 feet from eucalyptus trees, also 18 feet apart. They are 8 years old, blossom well and have hardly borne at all. It is a silt soil. Summer apples bear in the same row 150 feet distant on the same soil. Shall we prune severely this year, or light? They were not pruned last year but were pruned heavily the year before. They are irrigated three times—June, July and August.—J. R. W. Corcoran.

We should not prune at all this year. Cutting hard into apple trees of bearing age often throws them out of commission for a time. Keep up irrigation and spread some manure. We doubt, however, if you get much from the trees. They are too near to the eucalypts and too near to each other to behave well.

Tangle-foot for Birds.

To the Editor: English sparrows and linnets have taken most of our fruit buds, and take all of our garden stuff as soon as the plants are through the ground. We are afraid they will do much damage to the cantaloupe crop. We are all shooting and poisoning, but there are so many we scarcely miss those we kill. In England they used a sort of bird-wax on the limbs of trees and hedges, which was a success in holding them fast. Can you tell me how to mix any such wax: resin and what else?—W. A., Turlock.

Dissolve powdered resin in castor oil, using heat to promote the solution. The oil and resin will combine in any proportions. Add resin until the stuff will hold fast enough to catch the bird. We doubt if you will catch enough birds to count much, but you may put up a good scarecrow of fluttering birds to frighten the flocks away. We would not put much of this stuff on trees you care anything for. It might be more effective daubed on small ropes from tree to tree or on the tops of fence boards and posts. Birds naturally take to such horizontal perches. You, of course, incur the risk of trapping song birds which the law protects and having some fines to pay.

Cutting to a Bud.

To the Editor: In pruning my young apple, pear, peach, and prune trees, I cut so as to leave not more than about a quarter of an inch above the bud to which I cut. Some tell me to cut even closer to the bud, while others tell me to leave half an inch. What would you suggest?—D. S., Santa Rosa.

In cutting to a bud, it is desirable neither to leave too long a stub nor to expose the backing of the bud. In one case it cannot heal over well; in the other, the drying back is apt to kill the bud. The best rule we know is to bring the blade to rest on the point of the bud and cut straight across. Sap flows to the bud at an angle from the opposite side of the twig so that too much of a stub above the sap stream would simply die out and could not heal over.

Apricots to Windward.

To the Editor: Will you kindly inform me what makes an apricot tree grow towards the prevailing wind while all others grow with the wind?—Nature Observer, Salinas.

You must ask the Lord who made the trees with that amount of spunk. We can only guess that his purpose was to teach apricot growers that they must head into their difficulties bravely and overcome them. If we were now exhorting prune and apricot growers to improve their attitude toward co-operation we should point to the apricot tree and say: "Go to it, boys, like a 'cot: don't turn tail like a prune!" And we are not sure that such is not the voice of the Lord.

Planting Sorghum.

To the Editor: Have been reading in the last issue of the Rural Press about sorghum and would like to know which is the best way to prepare ground which is weedy. It was plowed last fall and has been overflowed by creek lately. It is a sand sediment soil which overflows every year.—C. F. B., Yolo.

If you have a good crop of weeds now plow them under as soon as the ground will stand it and let it lie. Lightly disk out the weeds which start by planting time—which is when the ground is warm and frost danger over early in May. Sow so as to have ample room for cultivation and don't forget to do it both for moisture and weed control. Read carefully the suggestions on page 298 of our issue of March 10 last.

Transplanted Onions.

To the Editor: Can a crop of California red onions be grown from plants transplanted during the next month, or will it be too late for that kind of onion? Which is the best kind of seed to sow now for a fall crop—one that will keep best?—W. B., Glenn.

Yes: if moisture holds in the soil and a few late showers help them to catch on. Red onions can be transplanted as late as any other, if the plants do not get too large, but the crop will come later and therefore usually worth much less money. The Southport White Globe seems to have the call on popularity for lateness and long-keeping. Of course you are starting rather late for interior upland situation.

Who's Who and Why in Calif. Prune and Apricot Growers.

[Written for Pacific Rural Press.]

T. S. Montgomery.

Facts of Interest to Growers.

Outgrowth of Growers' Information Committee organized May 29, 1915.

Incorporated Feb. 23, 1917, with \$505,000 subscribed out of the total capital of \$2,500,000.

Over 4,000 prune and apricot growers had, on Mar. 15, signed up their crops in the Association.

Twenty-four trustees elected by subscribers by districts and one appointed by State Market Director, chose 13 directors living in 7 counties.

All officials have unqualified respect and confidence of growers in their districts.

The organization will fail May 1 unless \$750,000 in stock and $\frac{3}{4}$ of the total acreage of prunes or apricots shall have been subscribed.

Sale of crops to outside packers this spring may bring failure and loss to all.

It is estimated that \$85,000,000 are invested by growers in prunes and apricots.

Biggest prune crop was 210,000,000 pounds in 1912. High prices due to short crops since then have stimulated planting, so in five years the crop may be 400,000,000 pounds.

Jos. H. Bone.

Officials Command Confidence.

When a president was required for the organization that is to represent at least $\frac{3}{4}$ of the \$85,000,000 prune and apricot industry, the growers' representatives elected a man who had been 40 years in the real estate business in their midst, proving his words by his deeds. They chose a man who started as a newsboy without a dollar and who is now president of a leading bank in his district and president of the Agnews State Hospital; who received the highest number of votes of the growers themselves in both their primary and final elections of trustees for their organization—T. S. Montgomery of San Jose, a man with a kindly face showing the marks of many years, but capable of a most delightful twinkle when he says that a real estate man can be as honest as anyone.

For a general manager, they chose a man who has grown and packed prunes and apricots in a large way in Santa Clara Valley for 25 years;

and every year of it, has spent a month or more getting next to the Eastern dealers and their markets. H. G. Coykendall and two or three associates put big money into growers' pockets last year. When they discovered other California packers depressing the prune market by offering large quantities of fruit at $3\frac{1}{4}$ cents in the Eastern market before the crop was set and before the packers had contracted with growers for the purchase of that fruit, Mr. Coykendall and his brother, through their Eastern brokers, bought 15,000,000 pounds of these "short" sales, representing $\frac{1}{4}$ of the entire Santa Clara crop. They gave out the news that the other packers must have the prunes; and the growers who held on according to the Growers' Information Bureau advice made money.

When the old Cured Fruit Association had held a thousand cars of prunes over a year, they wanted to sell at $1\frac{1}{4}$ cents; but the Coykendalls sold them at $2\frac{1}{4}$ cents.

The merry war has left H. G. slightly gray, but ruddy, genial, portly, and able to take advantage quickly of every situation in dried fruit marketing.

Secretary-Treasurer.—When the prune and apricot growers got tired of being told always by dried fruit buyers that there was a tremendous crop on the other side of the Valley and in other parts of the State, they selected leading growers of every

Selling Crops Now May Bring Disaster.

The man who contracts his 1917 prunes and apricots now is not wise. Eastern retailers are forcing jobbers as never before. The jobbers are insistently ordering now on rising prices quoted them by California packers. Packers are buying from growers at 6 cents basis and upward to cover these orders.

Eastern food riots and newspaper talk about food shortage, the relative cheapness of dried prunes and our stocks of apricots, the fact

that many retailers cannot get enough canned fruits even of the 1917 crop, the prosperity of Eastern workers, the approaching control of the crop by the Association—all these conditions are forcing dealers to contract ahead for as much as they can get.

If the Association were complete, they could sell $\frac{3}{4}$ of their tonnage within a week at prices to be named by the Association when the crop is assured, is the emphatic statement of its General Manager, H. G. Coykendall.

Over 4,000 growers have thus far signed over their crops to the Association. Secretary-Treasurer

J. H. Bone states that over 90% of the extension agreements have been signed and most all of the rest are expected to come.

The organization is certain of success; except for one danger. If too many growers contract their crops to outsiders, they will kill the Association. Then its 4,000 members will rush to sell their crops and the

market will break. Those who have already made contracts will find much of their fruit rejected. If they do not kill the Association, then its members will get a higher price per pound than the outside contracts now being offered.

If prices go up, as there seems every reason to believe they will if the Association shall become fully organized, growers who contract crops now will lose the difference. If prices go down, much of their fruit must be rejected.

And the blossoms are not yet open on prune trees; while an unknown number of them on apricots are blasted by rain and frost.

California investigations made under direction of State Commissioner Hecke show that aphids will colonize on the Japan pear root; and while they may not cause as much damage as they do in working on the French root, it is plain that their board and lodging must cost something to the tree.

ABOUT THE DIRECTORS.

The president, vice president, and manager are directors.

W. G. Alexander, State Market Director's appointee, worked up from bookkeeper to General Sales Manager Sperry Flour Co. In 8 years quadrupled space required for Keystone Wholesale Grocery Co.

G. C. Alexander, Sonoma county, prominent prune grower.

F. A. Brush, Sonoma County, one of the largest and best farmers in the county, director 15 corporations, president of home bank.

H. C. Dunlap, Napa county, one of foremost young fruit growers.

D. Felsenthal, Ventura county, highly respected apricot grower.

C. G. Hamilton, Riverside county, manager most successful local co-operative dried-fruit association in the State.

J. O. Hayes, Santa Clara county, one of most extensive fruit growers.

A. Kammerer, Santa Clara county, president and general manager Cal. Farmers' Union, Inc., and large fruit grower.

Nathan Lester, Santa Clara county, well known fruit grower.

J. W. McAulay, Tulare county, progressive fruit grower.

THE TRUSTEES.

Four candidates were selected from each district except number four, in a primary election by ballots mailed to all growers who had signed up in the organization. At the final election by mailed ballots, two of the four were chosen. In district four, 12 trustees were elected from 24 candidates.

April-Pruned Grapes Did Well.

[Written for Pacific Rural Press.]

Being new at grape growing, and, like others in similar circumstances, being interested in the intercrop, J. W. Buchanan of Stanislaus county did not know last spring what to do with his 1800 Thompsons which had been planted the spring before as year-old rooted cuttings. They were spread out over the ground in April when Farm Adviser C. M. Connor called on Mr. Buchanan at the latter's request. He wanted to raise another intercrop of blackeyes; but he didn't want to buy stakes, and it was outrageously late to prune. Even Mr. Connor was stumped and he asked the College of Agriculture what to do. Being advised to prune them, anyway, all but one or two canes were cut off to spurs under a foot long, 2½-foot stakes were set for temporary use, and the beans

were planted. The vines bled heavily; but this winter do not seem much the worse for their late pruning, especially on the heavier soil. Some of the vines bore as many as 12 bunches of grapes.

Many slender waterspouts were produced on the vines where the soil is heavier, and many laterals on the fat fruit canes, which grew out of the wood left at the late spring pruning. The last year's wood is in fine shape. On a sandy strip where the subsoil is unknown, the vines are rather spindly and the growth short, though they were irrigated the same as the others. These would probably have done much better if pruned before they would bleed, as they were already weak and the bleeding weakened them still more. Late pruning may save the crop this frosty season.

Dipping Grapes to Dry Them Quickly.

To the Editor: We have some Thompson Seedless grapes which we dry each year, but on account of rains it is rather a laborious job. Is there a bleaching process by which they will dry in four to six days?—C. A. R., Turlock.

[Answered By State Horticultural Commissioner G. H. Hecke.]

For drying seedless grapes quickly, you may dip them in the following solution which has been successfully used in commercial raisin drying in the Sacramento Valley for many years. It goes without saying that the grapes should have the necessary sugar content, as near 24 per cent as possible.

Dissolve 30 pounds of bicarbonate of soda in 30 gallons of water, by thorough boiling; add 60 gallons of water to this solution and enough good olive oil to film the surface of the dip—about a teacupful will gen-

erally be right. If this dip does not sufficiently cut the bloom on the grape, add a pound or two of ordinary lye to the dip until it is strong enough to remove it. Keep this dipping solution at about 90 degrees F. and add a tablespoonful of the olive oil from time to time to replace the oil removed by dipping.

These directions, of course, are general, and will serve only as a basis for operations. Sugar content of grapes, cloudy days during the drying process, different brands of olive oil, all are factors in the successful adoption of this method, and hence, individual judgment is necessary to obtain the best results.

The raisins produced under this process should be of light amber color and will dry in less than half the time needed for the undipped product.

Durable Sulphur House.

"I'd like to find a material for fruit-drying sulphur-houses that would stand the sulphur," said E. B. Anderson of Contra Costa county last fall. "Sulphur disintegrates cement, eats out zinc, redwood, and building paper. The cement foundations in my sulphur houses which are in use four or five weeks with

steady fires each year, are half rotten after three years' use and will have to be renewed after three years more. Possibly some sort of paint would help it. The iron hinges on the doors must be renewed in less time."

"Galvanized iron is the material," said Frank Henry of Fresno county. "The sulphur doesn't take hold of that, but settles on it and drops off in an appreciable amount by the end of a season. It will last a number of years, but the sulphur at its base will eat even galvanized iron if dirt also is left piled up against it through the rainy season."

SAVES TIME IN PLANTING ALMONDS.

H. Mathews of the U. S. Malaki Reservation at Banning on March 12 was setting out 1300 almond trees. On account of getting started so late he did not plow his entire acreage, but just strips 3 feet wide and tree distance apart. After the trees are planted the neglected space which comes between trees will be plowed. He planted one row of Drakes to two rows of Ne Plus.

The Benson fruit standardization bill has been favorably reported to the State Senate.

PROFIT comes from fruit, not foliage. On Citrus fruits use immediately available

Nitate of Soda

It works while the fruit buds are forming. "Orange Culture" is a valuable book I will send to you Free if you will but ask for it. Send post card.

Not Satisfied with Orange Prices.

[Written for Pacific Rural Press.]

We print below a table of the expenses of marketing a Sacramento county orange grower's crop the past season, as per figures furnished us by A. Chapman of Fair Oaks. This crop was marketed when the oranges from that district were generally sour and poorly colored, not up to the 8 to 1 test which many in that county are opposing vigorously.

The spread between gross and net prices would not be so great if the grower had marketed through the co-operative Exchange. G. Harold Powell states that it costs the grower an average of \$1.29 per box of or-

anges to grow, pack, and load them on the cars in California. This grower paid \$1.17 plus \$.35 (for packing), or \$1.52 instead of \$1.29; and his oranges sold cheap.

In an investigation conducted by the Exchange April 15, 1915, to Dec. 1, 1915, in 34 representative cities and including 4,138 jobbing and retail prices, the price delivered by growers to packing houses averaged 63 per cent of the price at which the oranges sold to Eastern jobbers. This Sacramento county grower got 42 per cent by selling outside the Exchange.

Everbearing Blackcap Raspberries.

[Written for Pacific Rural Press.]

On the sandy loam of the Van Nuys district in Los Angeles county are many prosperous little farms on which are grown much fruit, berries, and garden truck. Here is located a 1 1/2-acre patch of blackcap raspberries belonging to L. M. Hartwick and Mr. Boulanger of Orange who propagated them from vines brought from the East and fruited on his own place last year.

Bear All Season.—If the vines over at Van Nuys fruit as heavily in proportion as the old ones," says Mr. Hartwick, "they will bear 10 quarts per hill this season. Many people say they can't get more than one crop per season. We get a new crop every time we irrigate once per month. You need to check the vines after picking the berries, then the water and warmth make them blossom and bear again.

Plants are obtained by covering ends of canes and their laterals with dirt after through bearing. These root at the tips and may be transplanted in the spring as late as April if the roots are not allowed to dry and if the plants are shaded for a while.

When the canes are 16 inches tall, Mr. Hartwick says their tips should be cut off. Three or four shoots from each cane will grow; and their tips should be cut off when they are three feet high. This gives lots of laterals for fruit bearing. On the Hartwick-Boulanger place, the vines had many branches, which were not cut back except to keep them from touching between the rows, which are eight feet apart. The hills average 30 inches apart from center to center, having one to eight canes each. Canes which bore fruit last year are cut out in winter. No trellis had been provided, though the canes are not very stiff. Water is run down between the rows

from a valve-equipped concrete irrigation standpipe at the head of each third center, the rows being about 100 yards long.

BORDEAUX WHEN BUDS ARE PINK.

To the Editor: How strong should we make Bordeaux spray for fruit when the buds are in the pink?—T. A. G., Mendocino.

[Answered from Wickson's 'California Fruits']

Lime 4 pounds, bluestone 4 pounds, water 40 gallons. Slake the lime and dissolve the bluestone with part of the water in separate vessels, hanging the bluestone in a bag just under the surface of the water. Do not use a metal vessel for the bluestone. Hot water will dissolve it more quickly; but both the lime and bluestone solutions should be cold when mixed and diluted with the rest of the water. The proper mixture will be a beautiful blue wash. A strength of 10-10-40 would be safe on dormant trees and would resist rains better.

IS LYE WATER GOOD FOR TREES?

[Written for Pacific Rural Press.]

Two years ago the lye water from the Banning Cannery flooded 80 French prune trees eight years old belonging to F. C. Jost. That fall, after the lye water had evaporated or soaked off, the trees were cultivated, working in about 200 pounds of peach skins and leavings from every ton of the lye water.

Last year the prunes averaged 57's, while the rest of the trees in the orchard produced 70's to 80's. In previous seasons they had all averaged 70 to 80. This year Mr. Jost has put in an eight-inch pipe to carry lye water from the cannery to his peach orchard.

OFFICERS HAVE THE CONFIDENCE OF GROWERS.

(Continued from page 356.)

prune and apricot district in the State as a Growers' Information Bureau. On May 29, 1915, we saw Jos. H. Bone diffidently accept the chairmanship of this Bureau. We watched the frantic efforts of packers to discredit their crop reports so they might contract from growers at low prices, and we saw the prices rise as a result of many growers' confidence. Mr. Bone had 40 acres mostly apricots, had been 10 years around San Jose, had held high positions in accounting departments of big business; and he had an inexhaustible store of boostiveness for the organization after he became convinced of the demand for it. He is its secretary-treasurer.

Vice-President W. A. Yerxa of Colusa county has for many years held the confidence of Sacramento Valley fruit growers. After successful experience in growing prunes in an old orchard, he has in the past two years planted 250 acres to prunes in his home county.

Know Your Soil

Many Soils That Look All Right Fail to Produce Good Crops

If you are not getting a full crop from your land—no matter whether it is set to alfalfa, fruit or grain—it is very probable that the principal fault is in the soil itself.

Looks don't count with soils, for many a fine-looking soil is deficient in some of the elements necessary to produce a good crop.

It costs just as much to cultivate a poor soil as it does one that is perfect. The difference in the crop obtained, however, often measures the difference between success and failure for the rancher.

Many ranchers who realize this fact have hesitated to have their soil analyzed on account of the knowledge that soil experts are expensive. All such will learn with interest, therefore, that a little machine has been devised, which will not only test soil accurately but will show just what is needed to bring it up to the maximum of bearing efficiency.

The initial cost of this little machine is very nominal, considering its earning ability in greatly increased crops. Once the device is obtained, the cost of each soil test is only a few cents.

No experience or technical knowledge is required to operate this soil tester; in fact, thousands of them are now in use by ordinary ranchers in all parts of the country.

These wonderful machines, which are fully guaranteed, are being placed upon the market under the name of the "Standard Soil Tester." They are being distributed on the Pacific Coast by Mr. Clement B. Stern, 613 Central Mortgage Building, San Diego, California, who will be glad to mail prices, testimonials, and full information concerning them, to any reader of this paper who will simply drop him a line.

Timely Orchard Suggestions.

Get a soil auger now and find out this summer how deep the irrigation goes. The roots will go no deeper.

Where walnut buds have not opened, it is time to spray with lime-sulphur 8 to 1 for aphids. You can't control them so easily after the leaves are on.

Plan to keep the brown mites or red spiders from defoliating your trees this summer.

Plant olives now, several varieties for a succession of ripening to keep pickers busy.

Citrus trees may yet be planted. Defoliate them to prevent evaporation until roots start to supply water. Whitewash them to prevent sunburn.

If the deciduous trees you have planted are not yet protected from sunburn, put up light-colored protectors or whitewash.

Look up at your library the bills before legislature that affect fruit growing and give your legislators a letter on what you think of each.

Don't leave any big clods in the orchard. Dirt is worth too much to

waste that way.

Don't leave any big clods in the orchard. Water costs too much to waste that way.

Soon will be the time to plant summer cover crop of sweet clover, alfalfa, beans, etc., if you have enough water. It will save fertilizer and add humus which will in turn save some of the water.

Try a few experiments with a few trees in each. Find out what fertilizers you need, whether you are irrigating right, whether your system of cultivation is best, whether a straw mulch might be better.

Plant olive trees for windbreaks. A few strawberry plants in the garden, of varieties that are especially good to eat, will make you independent of the less well-flavored and less well-kept berries that you would buy.

If there is any manure on the place, apply a good dressing to part of the trees and watch the effect.

Don't irrigate until after fruit is set, if the ground is moist.

Spray now with tobacco solution for apple, peach, and cherry aphids.

Size Only Maturity Test for Pears.

Sacramento, Placer, and Contra Costa county Bartlett pears were picked last season at various times and ripened at the University of California under supervision of Professors W. V. Cruess and P. M. Stone. Some were simply held at 68 degrees temperature and tests of sugar, starch, and specific gravity of juice made as the pears ripened. Some also were held in a refrigerator, in a desiccator, and in an atmosphere of carbon dioxide. The first pears picked in Contra Costa July 8 never did ripen into good eating fruit while those picked two days and more afterward, developed the juiciness and aroma desired, being better the later they were picked; though tree ripened fruit had coarser texture.

In their article published in the Monthly Bulletin of the State Commission of Horticulture, the following points are made:

The acid-sugar ratio or starch tests with iodine do not seem to be of much value in judging the proper

stage of maturity for pear shipment.

The sugar content increased so slowly that this is not considered worth anything as a test.

From the data at hand it seems safe to say that pears 2 1/4 inches in diameter or larger will ripen satisfactorily.

Similar pears stored in the refrigerator ripened in 21 days, while similar ones at 68 degrees ripened in 13 days.

Pears stored in air at room temperature ripened in 10 days, while those stored in carbon dioxide showed practically no ripening after two months.

Oxygen is necessary for pear ripening.

Pears ripen from the core outward and first at the stem end as shown by the iodine test for starch (which is converted to sugar during the ripening).

Pears received July 10 from Sacramento, Martinez, and Auburn required 11, 10, and 13 days respectively to ripen at 68 degrees.

Berry Prices are Good.

[Written for Pacific Rural Press by M. J. Moniz, Sebastopol.]

The berry situation in the Gold Ridge district is especially fine, owing partly to the good prices being paid outright by independent canneries. Among these are the Green Valley Co. of Graton, and the Central California Canneries. These have been paying \$50 per ton for Lawton and Mammoth blackberries and \$55 for Loganberries f. o. b. Sebastopol. This is the best in three years; and is likely to be exceeded by those growers who belong to the Sebastopol Berry Growers, Inc., who up to date have received almost as much for last year's crop. They are expecting more this season under the term contract with the California Fruit Canners' Ass'n now combined with the big merger. The Green Valley Cannery is offering three-year contracts at \$45. These prices will occasion more

planting now and next season. So far, the crop outlook is good.

Brawley reports a heavy movement of early vegetables from there to the Eastern markets. So far 400 cars of lettuce have been shipped from that point since the first of the year.

Mr. Grape Grower:

IT IS ALMOST TIME FOR MILDEW.

Let us send you an AMERICAN BEAUTY NOW, and when the time to sulphur comes, YOU will be ready, and YOUR CROPS will be SAFE.

REMEMBER—"A puff in time saves the vine."

THE AMERICAN BEAUTY SULPHUR MACHINE

was awarded the BLUE RIBBON and DIPLOMA at the 10th Annual District Fair, at Fresno, Cal., 1916.

It is not an experiment, not an imitation of any foreign device. It is a California product, designed and built in California by practical men, to meet the needs of California and West Coast growers. It is the result of two years' work and study, in field and factory, and has been subjected to the most rigid vineyard tests, under the personal supervision of one of the leading grape-growers of Fresno County.

It takes the sulphur right from the sack, crushes the lumps, and passes it through the finest screen ever used—then delivers it in a perfect cloud of fine, clinging sulphur, without waste. You will hear no "Bird Shot" rattling on the leaves from this machine. It will cover almost double acreage with the same amount of sulphur, because the sulphur is more finely

divided. It works evenly and continuously, from start to finish, and will not choke, clog, or stop feeding for any reason. One rancher ran sixteen sacks of sulphur through an AMERICAN BEAUTY without trouble of any sort.

DON'T lose valuable time tinkering with a poor machine. A few hours lost at a critical time may cost you your CROP. Insure success by being prepared.

Send us \$11 today, and we will send you an AMERICAN BEAUTY, all charges paid. Try it a week, and if you are not entirely satisfied, send it back at our expense, and we will cheerfully refund your money.

WE FULLY GUARANTEE EVERY MACHINE.

Packing for Big Cherry Prices.

A very little extra trouble insures reward for the expensive California system of packing cherries.

[Written for Pacific Rural Press.]

Late last June, M. D. Kennison of Napa sold on the New York auction 10 boxes of 9-row Bing cherries at \$4.25, 20 boxes 9-row Bings at \$4.50, and two boxes 8-row Lamberts at \$6.37½, double or treble the ruling prices.

Mrs. Kennison packed them, and they both agree that the high prices so late in the California season were due to quality and packing. They take pride in putting up the best fruit, never an imperfect cherry; and, with these sizes, every layer packed. Each cherry is handled only once after picking.

Packed and Nailed Tight.—A very important part of getting such prices, is to get the perfectly packed cherries to market without their jarring loose or being pinched and bruised. This depends on the nailing of the boxes.

Neighbors tell Mr. Kennison that he takes too much trouble; but he says, "Why should I put up an expensive fancy pack and then for lack of a little extra trouble nailing, allow it to go onto the market, messy?"

He nails down the center of the bottom without bruising the cherries. Then he runs his finger along the outside top rows of the fruit; and if any are loose he nails the center of the top, and draws it down so everything is just tight and no more, using 4d nails on the top, but shorter ones on the bottom.

To prevent bruising when the center of the bottom is nailed down tight, the edge of the sidepiece of the box is rested on a block high enough to lift that side just free from the bench.

A hole through the cover is made with an awl. Then the nail can be driven without bruising fruit. The box is turned around and the other end of the center nailed similarly. If the top of the box must be tightened, the center of the bottom can rest directly on the block to take the jar, because it has already been nailed.

Then the boxes are packed in shipping crates which hold four or five each, to avoid the roughness of handling each separately.

Grape Mildew Annihilated.

[Written for Pacific Rural Press.]

Mildew attacked J. A. Schlueter's 8½ acres of 6-year Thompson vines with all its host of spores in repeated invasions. It also attacked the vines of his neighbors. It was victorious on some of the latter, but was slaughtered on the Schlueter place and not a spore lived through so far as you could see on the grapes or vines.

The artillery that slaughtered the enemy was simply knapsack sulphur sprayers, the ammunition was dry sulphur. Only one artilleryman was required to repel the first and second attacks in one day each. He began when the shoots were only four inches long.

After the vines became heavier, it took two artillerymen two days to repel each of the six attacks. Two extra sorties had to be cared for on

one end. The last battle was fought to a finish on Aug. 24.

The sprayers had sharp angles on the ends of their tubes to seek out the enemy in its most secure positions on the under sides of leaves. The tubes were held in the vines and worked back and forth, to get sulphur on every spore. The reason the enemy did great damage in other vineyards is that inexperienced or careless sprayers are likely to miss the lower and inside leaves just where the mildew thrives best.

Goggles were tried by Albert Schlueter, who did a good bit of spraying last season, but he says the sulphur would get on them and sweat would wash it into his eyes until he was nearly blind. It was better with the goggles off.

APPLE BOX SIZES.

To the Editor: What is the weight of contents and size of the standard apple box?—W. G., Sheridan, Nevada.

Under the California "Standard Apple Act of 1915," any box labeled "standard" shall be 10½ inches deep, 11½ inches wide, 18 inches long, measured inside without distension. The ordinary California apple box is 9¾x11x22 inches. Oregon boxes are 10½x11½x18 and Colorado boxes are 11½x11½x18. There is no Federal standard apple box so far as we know. There is no weight limit. The weight will vary with the size of the apples and the bulge.

LIME SULPHUR NOT POISON.

To the Editor: I have just recently sprayed a young orchard with lime sulphur solution and have been informed that the grass upon which the solution fell is poisonous to stock.—J. A. H., Calaveras county.

It will not hurt the stock.

Handling Grain in Bulk.

To the Editor: This was just about the time last year that the sack question became a problem with our farmers, and it appears that it is going to be no less a problem this season. Having had the experience of erecting and conducting an elevator during the past season I have had several calls for information regarding how to construct, what experience, etc. I am enclosing you copy of a letter written to one of the inquiring persons.

About the first of May, 1916, in partnership with the Hayes Company, the work of constructing an elevator began. The building was finished for receiving grain in early part of July. This is important to the person building a new elevator, commence early for lots of things turn up short when wanted badly, and waiting after grain is ripe to cut doesn't pay. All who intend putting grain in elevators of their own or through other elevators should begin at once to look up information. This elevator is located at Athlone, Cal., along the Southern Pacific track, the lease for the location costing five dollars. An elevator erected by Wm. Colley at Chowchilla and one erected by Wm. Boyden at Merced give three elevators in this immediate neighborhood, all of different type, so any persons desiring to build may easily secure information.

Some of the farmers hauled their grain in bags from the machine to the elevators and used the bags several times and sold them for half price. Others used grain beds and hauled direct from machines as the grain was run from the machine into the wagon.

Crops are looking well now although for a time our farmers felt "kinder" weak in the knees. The April showers will tell the tale.

The bulk handling of grain or handling by sacks through the elevator is a success both as to saving time and expense; and now needs the co-operative efforts of the farmers. Had the warehouse men had their way there would be no elevators now in this county or perhaps anywhere else, for several reasons I have not the space to mention. However, there is plenty of room for both warehouses and elevators in California for years to come; though it should be said that the farmer that clings to sacks will find he is losing money. The sale of grain in bags seems easier now because the buyer gets more for his money and the farmer thinks he is getting more for his grain. There was about five cents difference per sack in the sale of barley last year in favor of the sacked grain. This difference would lead many farmers to believe that it would be useless to try the elevator if the selling price is different. The idea that a farmer is selling a ten or fifteen cent sack for five cents does not occur to him, and the buyer, especially milling companies, know in paying this difference they can easily value the sack for more than fifty per cent sack quotations.

The cost of construction of the elevator at Athlone was as follows: Materials, lumber, nails, cement, rock, sand, bolts, \$1817; labor and board of men, \$1242; equipment, cleaner, scales, belting, motors, elevators, conveyors, etc., \$1236. Total, \$4295.

The building is made of 2x4 mountain pine surfaced on two sides, laid on 2x10-inch sill which is bolted to cement floor and foundation. Dimensions of building, 56x28, and 32 feet to top of bin. Consists of eight separate bins 13.5 ft. square.

The top of the building is covered with cedar shingles, and no other covering for the walls is used, though the south end leaked during the storm of the present winter and should have covering of some kind. Capacity of all bins about 18,000 bushels.

There were 2,800,000 pounds of barley handled through the Athlone elevator last year. The handling of bulk grain through the elevator began July 12 and continued until about Oct. 1.

The cost of handling this grain for help and power, etc., was \$512.62, or a trifle less than thirty-eight cents per ton. This cost was for handling through cleaner into elevator and loading onto cars from the bins.

No effort was made to handle any outside grain, as space for storage was lacking, and the shortage of cars forbade taking grain in for immediate shipment. Under ordinary conditions when there is no car shortage, 75 to 125 tons of grain could be handled through this elevator and shipped each day.

Two men operated the elevator with ease and could have handled much more grain. The cost of preparations for handling grain in bulk is trifling on the ranch. Three grain wagon boxes should under ordinary conditions be sufficient to carry all the grain from the largest harvester. These beds cost \$42 if made strong enough to hold one hundred bushels of barley, or say fifty sacks of one hundred pounds.

The Holt Mfg. Company constructed a bin on the harvester used in the above handling of grain last summer which held about thirty sacks or sixty bushels. Sometimes the wagon was not on hand to receive the grain from the machine and the grain was run into this bin with no occasion to stop work. A hitch was made on the tractor and one side of the harvester to which the wagons were attached; and this could be operated while the machine was in motion. No horses used except to take away this wagon and bring it back. Several of the farmers never unhitched their horses, but when a wagon was loaded another drove under the loading spout.

My grain was harvested twelve miles away from the elevator and was stored into a field bin holding about 2,000 sacks, or 4,000 bushels. From this it was taken into the Athlone elevator in wagons and motor truck. This made an unusual expense; but it is practical and economical, even at this distance. The field bin was necessary when some delay of the machine occurred, or delay in transportation of grain to elevator at Athlone.

I desire to say that the elevator is a success and now needs only a few changes and the education of the farmer to how easy it is to change to the system. Elevator in field cost \$460, and was run by small one and one-half horse-power gasoline engine. One man was required part of the time to attend to elevator in field but will be dispensed with the coming season. This expense was \$156.00. All the expenses incidental to changes and operation of the bulk system would not exceed the expense of the sack sewer and helper. Where harvesting is near an elevator, the entire saving could be made, and the same cost will buck and haul the bulk grain as the sacked.

Growing 35 Tons Silage per Acre.

[Written for Pacific Rural Press.]

By growing 35 tons of silage corn to the acre on nine and a half acres of old alfalfa land in 1915, Framp-ton Bros., dairymen of Los Angeles county, believe they made a State record. But be that as it may they are sure that the land in question produced the most profitable crop of any land they have ever farmed.

Two factors were considered as all-important in the size of the crop: First, a soil that had been heavily fertilized for several years while planted to alfalfa, and secondly, a variety of corn which, in their opinion, is the greatest yielder of any corn ever introduced in the State.

In June, 1914, the alfalfa sod was plowed up with the intention of planting rotation crops for a year or two before re-seeding back to alfalfa. Potatoes were selected as the first crop and yielded abundantly in the fall of 1914. Also the cultivation they received left the ground in fine physical condition for the crop of grain hay that was planted in the winter.

But neither potatoes or grain hay solved the dairy cow feeding problem which presented itself in the way of having to buy high-priced mill feeds for the cows during the winter months, the monthly bill for which was \$90 as a rule.

The silo, they were advised, would overcome this monthly feed expenditure, so plans were made for the erection of a concrete silo and the planting of a small field of silage corn. A neighbor who had raised corn for a number of years was appealed to for seed, and furnished them with enough White Cob corn to plant their land.

As soon as the hay was off the land it was irrigated and plowed good and deep, planting being done with an ordinary corn planter. After that thorough cultivation was given the field, by which time it was so high that a team could not be driven down the rows.

Just before the corn began to silk out, deep furrows were run between the rows with shovel plows, the dirt from the furrow being banked up around the roots and butt end of the stalks. This served to strengthen the root system and by being careful not to overflow the furrows when irrigation was in progress there was no toppling over of stalks as is sometimes occasioned by irrigation at this stage.

Before the corn had reached maturity for silage purposes, it was seen that the one silo was not sufficiently large to care for the nine and a half acres and at the suggestion of the silo builders another of equal size was constructed with the understanding that it would be paid for by the month, with the money that had previously been paid out for mill feeds.

When harvested the last of October the two silos were completely filled, thus indicating a yield of 333 tons, based on the silo measurement.

Soon after this feeding was begun, the ration per cow being 20 pounds of hay and 40 pounds of silage, and by the time the first silo had been fed out it was paid for on the monthly installment plan. Also the

milk flow had been equally as heavy as when mill feeds were fed.

Actually the silos did not pay for themselves the first year if rent of land, planting, irrigation, cultivation and harvesting are considered, but with 35-ton crops of corn it is perfectly feasible to expect them to pay out the second year.

WHAT CORN FOR SILAGE?

To the Editor: What is the best variety of Indian corn for silage? Is there a variety that better suits the Sacramento Valley, and particularly this immediate district?—L. W. J. Winters.

So far as we know there is no one variety which has established itself as being the best, although Leaming Yellow Dent is probably the most extensively planted variety. Stanford Yellow Dent does well in the upper part of the Sacramento Valley and we have had highly satisfactory reports from Orange County Prolific the past year. Red Cob Ensilage has made some wonderful yields in the San Joaquin Valley but we know of no experience with it in your locality. Probably the University Farm at Davis could tell you.

Furrows and Flood Irrigation.

[Written for Pacific Rural Press.]

In Orange county, orchard irrigation is quite generally by a check and flood system with short levees shoveled where needed. In Riverside county, it is quite generally by furrows, but growers there are beginning to notice that furrow irrigation carries the expensive nitrates to the tops of ridges between furrows, and evaporates, leaving the nitrate in a thin crust on top of the ground. This dries out and cultivation doesn't work it down to where tree roots could use it; so much of the nitrate is wasted. Flooding does not have so much of that effect.

Furrow irrigation is unsatisfactory too in many Orange county orchards. One of these is 60 acres of Valencias on the Carroll Ranch. The soil is a light loam averaging about three feet deep and tending to sand. It holds moisture pretty well if cultivated right, but Mr. Carroll says water in furrows would sink at the head of the row and never

get through nor soak sidewise. So big stream flooding is desirable.

This is made possible by his No. 7 centrifugal pump and electric motor on a well in which water comes within 20 feet of the surface. The whole place is piped with underground 14-inch pipe and supplied with irrigation valves and gates.

Flooding and Gum Disease. — He was irrigating late in September, having made two lines of checks per row of trees. The trees themselves were inside one row of checks and the water surrounded their trunks. This has been done many times without infecting the trees with gum disease, because there was none of that fungus in the soil and none was carried in by irrigation. But last winter, flood water broke over part of the place and stood on it some time. Inspection afterward showed the disease just starting. It was promptly cut out and painted with Bordeaux paste and other trees also painted for prevention.

of October, for they must be cured in little piles in the field.

In harvesting, two rows of beans

are cut at once, being thrown into a windrow, then three windrows are stacked into one row of little shocks. This year the last named row had to be partly doubled up by staggering the shocks, because the

vines were so heavy. They had grown to $\frac{3}{4}$ the diameter of your finger and made a dense mat. Pods three inches or longer mature from the moisture and food in the vines; and the beans do not shrivel.

DETERMINING SOIL LIME.

The benefits of lime, to increase the fertility of soils and for the liberation of plant food material in the same, is becoming more and more established in the minds of all thoughtful agriculturists. Authorities in Europe, and such eminent soil experts as Prof. E. W. Hilgard, Dr. Hopkins and Dr. H. J. Wheeler have long been convinced that most vital essentials for soil fertility are lime carbonates and humus. On page 354 of his Book on Soils Dr. Hilgard says: "In general, lower percentages of phosphoric acid, potash and nitrogen are adequate in the presence of a large proportion of calcium carbonate."

Most agriculturists do not know the carbonate and humus contents of their soils, because heretofore they have not been able to ascertain them, without a complicated or expensive analysis. Dr. M. O. Reiche, late soil chemist of Munich (Germany) agricultural experiment station, has recently perfected a device which is so simple that any child that can read the directions can operate it. It will determine, in a mechanical and automatic manner, the carbonate and humus content of soil at a cost of only about one cent per test and in a few minutes of time.

IRRIGATED LIMA BEANS GROW LATER.

[Written for Pacific Rural Press.]

"My beans shouldn't have been irrigated last season," said E. E. Dunning of Ventura county last September. "After as much rain as last winter in our location (about 20 inches) with fine cultivation, the beans would have thrived through the season and ripened in time. They were irrigated in my absence about June 21. Now we can't begin to cut them until the second week in October, and then there will be a lot of immature pods. It will also be more likely to rain on them."

As it happened this year, Mr. Dunning was lucky to have the vines unharvested in the early days

Some-day

Factories at Marysville and Benicia, California

you'll own a tractor

You can get your work done when the ground is in condition. It relieves the horses of the heaviest service, and can work night and day. Besides, the tractor is an economical source of farm power, and is adaptable to a wide range of service.

A Tractor is the road to better, more profitable farming

A tractor cuts the costs of plowing power and labor.

It insures harvest profits—no danger of losing a crop through enforced delay in getting horses to work.

It is a big step to sell off the horses and buy a tractor and needs careful investigation.

We have tried to put the pertinent facts about the Yuba Ball Tread Tractors in the Yuba catalog—

Send for it.

We will do all we can to help you find out about every part of the Yuba, its uses and its construction; to watch it under actual service; to use it yourself under your own conditions; to show you *why it is the tractor for you.*

Net Stacking of Alfalfa Hay.

[Written for Pacific Rural Press.]

Making good alfalfa hay is a work to which many California farmers pay too little attention; and it has usually been found particularly difficult to produce a good quality of hay when large acreages were involved, because of improper curing and handling.

On the Stanford University's ranch at Durham, Butte county, a good deal of attention has been given this phase of the farming operations because there are a thousand acres seeded to that crop; and hay making is continuous for several months as there are always six or seven crops to be harvested on the irrigated lands.

Crews are organized for the various parts of the harvesting operations at the beginning of each season, one crew doing nothing but mowing, another spending all of its time irrigating, and still another working on the rakes. Each part of the work is done with the aim of having the hay carry as large a proportion of leaves as possible when finally stacked; as it is the leaves rather than the stems which furnish most nutrients in alfalfa hay.

As near as possible, the alfalfa is mowed when it is just beginning to blossom out and raked into shocks soon afterward in order to avoid

excessive drying out of later cutting.

According to F. C. Franklin, managing foreman of the ranch, the greatest factor in good-hay making under extensive operations is the manner in which it is handled from shock to stack. At that time the greatest loss of leaves is apt to occur.

To prevent this loss, large nets are used, in connection with 20-foot racks that are divided through the center with partitions. The nets which are longer than the width of the compartment in which they are placed, are put on the bottom of the rack, with ends overhanging the sides. After the wagon is loaded, the ends of these nets are looped together at the top of the load.

At the stacking yard which is located in the alfalfa field, derricks are used, made of 40-foot cedar poles and having 25-foot booms that can be raised or lowered at both ends. Here the cable is fastened to the looped ends of each net and the entire netful of hay is lifted to the stack and dumped. This eliminates any rough handling of the hay after it is loaded; and according to Mr. Franklin, is a saving of about 30 per cent in the labor required in hauling and stacking. It also insures good leafy hay.

Early Rice Planting Advisable.

Early planting is a factor in profitable rice production of California that was quite generally overlooked by many last year, but one that experienced growers will not forget this year.

As an illustration of the seriousness of late planting W. E. Barnard of the Dodge Rice and Land Co. reports the experience of that company's tenants last season in the farming of 4436 acres of rice.

Owing to lack of machinery and organization a portion of the work was delayed so that some of the rice was not watered till after the first of May, while a large part of the acreage was watered before that date.

All of the acreage was given practically the same care during the growing season, but in checking up on the yields of the various tenants at harvesting time it was found that the average yield of all rice planted

before May 1 was 3234 pounds per acre, the lowest yield on that land being 36 sacks. On land watered for the first time after May 1 the yield was invariably lower, one field yielding as low as 24 sacks to the acre that was not watered till May 28.

So important does this company consider early planting that it has arranged for the hire of enough machinery so that they can plow, harrow and plant approximately 275 acres every 24 hours. This they consider is necessary in order for them to properly care for the 3700 acres that they will farm themselves the coming season.

It may also be of interest to intending rice planters that this company insists upon clean cultural methods of all rice fields and that the average cost of keeping their fields clean during 1916 was 20 cents an acre.

Experience with Sudan Grass.

[As described by W. E. Woodward, Ramona.]

Last May I decided to try some Sudan grass. I bought 25 lbs. which I sowed with a drill in rows 3 feet apart on a six-acre stretch, mostly bottom land but some hillsides. July 15 I pastured my first crop. I pastured four times on the bottom land and twice on the hillside last year. For Sudan one ought to plow deep and keep the soil well worked till May or June, then plant at least 50 pounds to six acres, leaving rows 18 inches apart instead of 3 feet.

This year I will put in 20 acres and divide it equally into three fields and pasture 25 head of dairy stock on it continually by transferring them in rotation. As Sudan does not need irrigation it beats al-

falfa for growing and I have tested it as superior for feeding. When I pastured on Sudan and fed alfalfa also, the milk flow increased to 60 gallons a day from 20 cows. When I changed from Sudan to alfalfa hay and pasture a marked decrease was noticed in the milk flow. [Sudan and alfalfa supplement each other to a considerable extent. Neither is economical alone.—Eds.]

The Santa Clara Blossom Festival was held at Saratoga March 17. There was soccer football by Stanford University team, a drill by school children, and an address by President Ray Lyman Wilbur of Stanford.

790 Bushels of Potatoes

PER ACRE, THE LARGEST CROP
ON RECORD IN THE U. S.

Were grown in California and awarded Grand Prize by International Jury, P. P. I. E. Not only was this the largest crop, but the quality was especially fine, bringing a price considerably above the market. The grower attributed a good part of his success to the use of

Gold Bear Fertilizer

The average crop of California is about 150 bushels. What do you get?

W. V. Shear, Potato Expert, says: "Don't try to save money by adopting cheap methods to cut from cost of production. Is it not

good business practice to spend enough money to produce a good crop and make money on the investment rather than use cheap methods and lose money?"

Fertilizing is not an expense, but an investment, yielding immediate returns.

Let us help you solve the problem of bigger and better crops.

San Francisco, California

Sudan Grass

CALIFLORA BRAND

This is one of the best-known forage crops used in the Southern and Middle Western States. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—lb. 50c; 10 lbs. \$4.00; 100 lbs. \$35.00.

Alfalfa Seed

CALIFLORA BRAND

This is our best grade of common Chilian alfalfa seed. On every test this brand of Alfalfa Seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample.

We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

ALFALFA

250 lbs. of MOCOCO Superphosphate per acre will increase the yield of alfalfa enormously. "In some cases the alfalfa growth has been tripled," writes Mr. F. F. Lyons, San Joaquin Co. Farm Adviser. Write for particulars.

THE MOUNTAIN COPPER CO. 332 Pine Street, San Francisco.

BETTER PRICES BROADER MARKETS

Part Played in Problem by Transportation—National Treatment for a National Enterprise.

IN every part of the country the farmers are turning their attention to questions relating to the handling of their products after they leave the farm. Transportation is a part of this problem. The cost of reaching their markets and the ability to reach them promptly at the right time are important factors in determining the returns from their crops.

Low Freight Rates

Fortunately the American farmer has at his command the lowest freight rates in the world. It costs no more to move a load of wheat 500 miles by rail than it does to haul it five miles from farm to station by team. A ton of farm produce of any kind can travel almost twice as far for the same charge on American railroads as on the government-owned roads of other lands.

The cheapness of transportation is not the whole issue. To meet the needs of the farmer transportation facilities must be ample. There must be plenty of tracks and cars and locomotives and sufficient terminals.

Billion a Year Needed

The railroads are anxious to provide means to take care of all the business they can obtain. But a vast outlay of money is required. A billion and a quarter dollars a year for the next ten years or more must go into railroads to provide the necessary transportation facilities.

During the past few years it has become more and more difficult to obtain, even in part, the money required for this purpose. This has been due partly to the poor promise of a satisfactory return on the investment; partly to the uncertainty created by numerous and conflicting regulations.

Regulate for All the People

Nobody seriously proposes that the public regulation of railroads shall be weakened. Certainly the railroads themselves do not. But it is a reasonable proposal that the regulation of this great national business should be handled by national agencies, on national lines, in the interest of all the people, and not by local agencies to serve local or sectional ends.

Regulation at cross purposes by 49 masters—48 States and the Federal Government—now imposes upon the railroads an annual burden of many millions of dollars of wasteful expense, from which the public derives no benefit. It is of primary importance to the farmer to cut down this waste in order that his products may be moved to market at the least expense and with the greatest possible expedition.

The farmer's interest demands free trade among the States.

HOTBEDS FOR SWEET POTATOES.

[Written for Pacific Rural Press.]

An average crop of sweet potatoes in the Livingston district of Merced county is 75 to 100 crates of 100 pounds each per acre; and the average price year in and year out is \$1 per crate, according to F. L. Landram, who has been in the sweet potato business here since its infancy over a score of years ago. He raised 30 acres of California Sweets last year, and this is how it was done.

Hotbed.—The hotbed was made Feb. 10, covering it with boards every night, rather than a month later and leaving it open as he used to do. Some people plant any time in March, as it takes about eight weeks for the plants to grow ready for transplanting, which is done any time up to June 1 with reasonable safety from fall frosts. It takes about 12,400 plants per acre. Each seed potato will produce a first crop of about eight plants and three-fourths as many at later pullings. If only the first pulling is to be used, it is safe to allow 95 or 100 square feet of hotbed per acre to be planted. This will require about 300 pounds of seed potatoes per acre. Fewer seed are required if the second and third crops of plants are used, but such plants will produce crops that much later.

For Mr. Landram's hotbed, a hole was dug five feet wide and about 16 inches deep. Ten inches of fresh straw manure was firmed in the bottom and covered with three inches of sandy dirt. Boards were placed on edge around the hotbed so they would project several inches above ground. "Seed potatoes" $\frac{1}{2}$ to 1 inch in diameter were laid in the bed close together as possible without touching each other; for if they did touch, they would rot, according to Mr. Landram. Five inches of sandy loam are sprinkled around and on top of the potatoes to make them grow long sprouts.

IS FROSTED SUDAN GRASS DANGEROUS?

To the Editor: Is there any danger in letting sheep pasture on Sudan grass that has been frozen? I planted some 4700 feet above sea level last year. It grew 12 inches, was frozen down late in April, and then grew an average of 5 $\frac{1}{2}$ feet tall. About half of the seed was ripe when fall frost killed it for good.—G. H. A., New Pine Creek, Ore.

This question was answered rather doubtfully a few months ago, the supposition being that since it is of the sorghum tribe, pasturing on the new growth after being checked by frost might be dangerous. We hope some of our subscribers have tried it without serious loss and will tell us their experiences for the benefit of the rest of our readers.

SPRAYING FOR SQUASH APHIS.

In spraying the under side of the squash leaves where the black aphids hides, feeds and breeds in greatest numbers, the O. A. C. Press Bulletin editor, who practices labor-saving devices in his back-yard gardening, turns the vines over by taking up the end of each runner and carrying it back over the center of the hill. This inverts most of the leaves for a thorough drenching without undue

We Manufacture Levelers for any Power

A Schmeiser Leveler of the "Giant" Type will work wonders on your farm

MOVING immense amounts of dirt daily, and working on ground too tough for horses and Fresno to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary as the case may require.

loss of labor and material. Care is required that blossoms and young fruit are not damaged, and it cannot well be done after the fruit reaches too great weight. But if spraying is well done during the early growth, and the young growing tips are lightly sprayed later in the season, insect injury will not be serious.

An effort is being made to organize an alfalfa growers' association around Dinuba.

The Salof Self-Setting Gopher Trap.

Only trap having free passage. Will entirely rid your place of gophers in one season. Will catch all sizes. If you want a trap that will give results, try this one. If your dealer can't supply you, you will be sent postpaid for 50c; 3 traps, \$1.00. Circular free. A. SALOF & CO., 39140 39th Ave., Oakland, Cal.

GRAINS AND FIELD CROPS.

Coachella Valley onions are about ready for shipment.

San Jacinto alkaline pasture lands are proposed for sugar beets.

The Orland Alfalfa Meal mill is to use first crop alfalfa this season.

Lima bean prospects are fine and the contract price is about 7 cents.

A sale of 1000 bales of cotton was made at Calexico last week at 18c per pound.

J. A. Brooks of Fresno county has patented a riding vineyard and bean cultivator.

A lot of 548 tons of Altamont hay was sold last week for \$20 per ton, to be shipped to Hawaii.

Canners are offering to contract for tomatoes in the Sebastopol district at \$10 per ton and furnish seed.

According to U. S. Dept. Agr., growers of California had only $\frac{1}{4}$ as much barley on hand as a year ago on Mar. 1.

L. H. Emery of the Lindsay Ripe Olive Co., is guaranteeing \$10 a ton

for tomatoes f. o. b. Porterville for canning at Lindsay.

It is announced from Imperial that a pre-cooling plant is being constructed there which will be used in shipment of asparagus.

Artichoke growing in Humboldt county to be based on the methods used in San Mateo county is exciting much anticipation.

Two dollars net to the grower for the last 750 sacks of barley held by a grower in Salinas Valley was paid recently by a Los Angeles mill.

At the Cloverdale Citrus Fair Feb. 21 to 25, the first prize feature exhibit, a Garden Wall, was installed by Mrs. H. I. Barker and Mrs. O. C. Williams.

More than half a million grain bags are already sold to farmers in the Paso Robles and San Miguel districts and orders for more are coming right along.

Eight hundred acres of beets for the Hamilton plant of the Sacramento Valley Sugar Co. are being planted near Princeton, Colusa county, on one ranch.

The Sperry Flour Co. is to hold a Corn Institute at Stockton Mar. 31, at which latest machinery and methods for corn growing will be shown. All interested are invited.

Stocks of corn on farms March 1, 1917, as reported by the Department of Agriculture at Washington, were 789,416,000 bushels against 1,116,559,000 bushels the same date last year.

Stocks of oats on the farms March 1, 1917, as reported by the Department of Agriculture at Washington, were 393,985,000 bushels against 598,148,000 bushels the same date last year.

Stocks of barley on the farms March 1, 1917, as reported by the Department of Agriculture at Washington were 32,841,000 bushels against 58,301,000 bushels the same date last year.

Stocks of wheat on the farms March 1, 1917, as reported by the Department of Agriculture at Washington, were 101,365,000 bushels against 244,448,000 bushels the same date last year.

Contra Costa County Sealer of Weights and Measures is inspecting hay balers' scales and notifying operators that they must label each bale with their names and the weight of the bale, also whether the hay comes from stack, shock, or bunch.

CITRUS, OLIVES, FIGS.

The Corning Olive Growers' exchange has decided to disband.

The Riverside district had shipped 1265 cars of oranges and lemons up to Mar. 10.

It is reported from Riverside that sixty per cent of the big navel orange crop of that section is still unpicked.

Spanish exports of olive oil were 82,670 metric tons during the first 11 months of 1916; while during the same period of 1915 they were 61,082 tons and in 1914, 42,274 tons.

Merced Calimyrna fig growers pooled their 1917 crop and sold them to the highest bidder last Saturday at \$230 per ton for first quality as against \$172.50 in 1916 and \$120 in 1915. There were 110 tons in the pool.

The investigating committee desired by Butte and Sacramento orange growers to investigate citrus standardization for two years seems likely to be recommended to the Legislature by the Assembly committee on agriculture.

Stanislaus county fig growers at a meeting held at Ceres last week perfected the organization of a fig growers' association. It is planned to increase the membership till every grower in the county is a member.

There is some talk of establishing a packing house and sending all figs out of the county packed under the association's name. A meeting of fig growers was also held during the week in Merced county, but no permanent organization formed.

GRAPES AND SMALL FRUITS.

Raisin Day comes April 30. There will be an elaborate celebration in Fresno.

About 5400 tons of raisins were shipped East in February. This is 2100 tons increase over Feb., 1916.

Vine pruners in the Fresno district who have formed an organization announce that they will expect a daily wage of \$2.50 for nine hours work instead of \$2.25 as now received.

Strawberries have begun to arrive from the Imperial Valley. A number of shipments were in last week and the berries were very good. They sold at \$7.50 @ 9.00 per crate of 30 baskets.

DECIDUOUS FRUITS AND NUTS.

Donald H. Graham planted 2000 pear trees in Antelope Valley this spring.

The last load of the 2000 box crop of apples from a Mendocino orchard was delivered at Mendocino in the middle of March.

Tulare peach growers have named a committee to contract their peaches to the highest bidder. They had 4,000 tons last year.

Early frost last fall and heavy winter frosts have killed a large percentage of young budded walnut trees in Sacramento Valley.

Sixteen fruit growers of Banning have clubbed together to make their own lime-sulphur spray. They have a carload of sulphur already this spring.

The Gridley Farmers' Union has contracted its peaches to the California Packing Corporation at \$40 for clings, \$25 for Lovells and \$22.50 for Muirs.

The Benson-Jones bill appropriating \$250,000 for a deciduous fruit experiment station has been approved by the Senate Committee on Agriculture.

When the California prune crop goes up to 200,000,000 pounds again, if we can't sell any abroad, every person in U. S. will have to eat two pounds per year. Horrors!

No more 1917 unpeeled dried peaches can be sold by the Cal. Peach Growers until the crop can be estimated, as all the orders that are safe have already been received.

About 150 tons of prunes were contracted around Ukiah about Mar. 15 at 5 1/4 cents for this year's crop and 4 cents for the next two years. This was when growers in other parts of the State were getting 6 cents where they were foolish enough to contract.

Reports received from many counties by the State Commission of Horticulture show a remarkable increase in acreage planted to trees and vines last month in California. Madera county planted 84,924 trees during February exclusive of several hundred thousand cuttings, the major portion being peaches, apricots and figs. Yolo county, 72,030 trees, with almonds in the lead. Large increase in all fruits. San Luis Obispo county, 65,050 trees, also shows almonds holding first place. Total increase here more than 30 per cent. Kings reports an excess of 109,000 trees and plants; apricots ranking first, prunes and peaches following in order mentioned. Yuba county: 385,316 trees, vines and plants were received for planting, prunes leading other trees.

MISCELLANEOUS.

The Saratoga Blossom Festival was postponed to Mar. 24.

The Linda Vista Poppy Festival will be held Mar. 31 east of San Jose.

N. P. Searles has been elected to succeed himself as Yolo County Farm Adviser.

Kill Squirrels Kill Gophers

GOLDEN GATE WEED CUTTER and MULCHER

Farmers, order early if you want the Golden Gate Weed Cutter and Mulcher. As the demand this year will be great, as it not only cuts weeds, but kills them, and leaves finely pulverized top soil. Cuts any depth. Prevents evaporation by working under the soil without disturbing soil on top. Write for circular.

C. G. SIGURD,
Capitol Avenue and McKee Road,
San Jose, Cal.

Macabee Gopher Trap

Small, simple, sure. At all dealers. If your dealer does not handle it, send 20 cents in stamps and mention your dealer's name and get sample by mail postage paid. Write for prices in larger quantities delivered free by parcel post.

Z. A. MACABEE,
Box P, Los Gatos, Cal.

CHUBBUCK'S IDEAL Gopher Trap

Larger than runway; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. Price 50c. If not at your dealer's send it to you postpaid: 2 for 95c; 6 for \$2.70; 12 for \$5.00. Money back if you are not satisfied. Free circulars. E. J. Chubbuck Co., Dept. B, San Francisco, Cal.

THE "ACME" PULVERIZING HARROW

Every farmer needs an "Acme" Pulverizing Harrow—no matter what his soil, or how large or how small his farm. The "Acme" coulters do the work as nothing else will. They cut and crush clods, pulverize, level and turn the soil twice—all in one operation. Make an ideal seed bed—conserves the moisture.

The special shape of the coulters gives results in soil cultivation that cannot be obtained by any other method.

The "Acme" is easily handled and a lifting lever is provided which allows the cutting edges of the coulters to be raised from the ground for transporting.

Write for our free book on the functions of harrowing the "Acme" way.

Plow Company
San Francisco Calif.

IRON AGE GARDEN TOOLS

Answer the farmer's big questions: How can I have a good garden with least expense? How can the wife have plenty of fresh vegetables for the home table with least labor?

IRON AGE Combined Hill and Drill Seeder

solves the garden labor problem. Takes the place of many tools—stored in small space. Sows, covers, cultivates, weeds, ridges, etc., better than old-time tools. A woman, boy or girl can push it and do a day's hand-work in 60 minutes. 28 combinations. \$3.25 to \$16.00. Write for booklet.

Gettoman Mfg. Co., Box 390, Greenock, N. Y.
KANOUSE & FOOT, General Agents,
FIRST & JACKSON STREETS, OAKLAND, CAL.

The Gridley Herald prints a list of standard farm books available to its readers on application to the Gridley High School.

Morris and Snow, seedsmen of Los Angeles, were bothered by a fire recently, but continue to fill all orders as if nothing had happened.

The Farmers Protective League has secured amendments to the State Market Director's commission men bill so that it does not apply so severely to co-operative organizations.

Loss to packed goods in transit may be avoided and a saving of lumber can be made by revising the methods of making boxes, according to the District Forester, 114 Sansome St., San Francisco.

The Western Pacific Railway has bought 104 miles of the Nevada-California-Oregon Railroad to get into Reno, Nevada. They also hope to get the road from Hackstaff, Cal., to Reno, and the road from Blairsden through Chilcote to Plumas Junction.

The Tri-States Agricultural Congress is to meet in Riverside Apr. 24 and 25. It will include presidents of the universities of Nevada, California, and Utah, and the Governors of the three States. The Salt Lake Railway will have a demonstration train there.

To prevent diversion of water from irrigation and to prevent destruction of scenery at the eastern gateway of Yosemite, a bill is pending in the Legislature to prohibit sale of electrical current generated by water power within the State, to communities outside the State.

As an evidence that Riverside county is growing prosperous we submit the following: Last year its orange and lemon crop brought in \$3,500,000; deciduous fruits, \$750,000; hay and grain, \$2,500,000; beans, beets and other staples, \$1,000,000. Its alfalfa sold during the year from \$15 to \$20 per ton; its olives sold at \$75.00 to \$175.00 per ton. Its bean acreage was increased from 1,100 acres the year before to 3,000 acres last year. Its deciduous and nut acreage is now put at 25,444 acres and its citrus acreage is 25,477 acres. There are in the county now oranges, 19,844 acres; lemons, 5,664 acres; grapefruit, 467 acres; apples, 3811 acres; apricots, 8156 acres; peaches, 3287 acres; prunes, 586 acres; cherries, 412 acres; almonds, 1545 acres; walnuts, 2205 acres; olives, 1870 acres; grapes, 2571 acres; cotton, 5000 acres; beans, 2799 acres; beets, 3220 acres; potatoes, 425 acres; alfalfa 29,168 acres, and grain, 122,701 acres. Dates are now grown successfully in the Coachella Valley. There are now 40,000 imported and 500,000 seedling date trees in the valley.

FROST DAMAGES FRUITS.

Peaches and prunes have not been damaged much by frosts but apricots have, in certain parts of the State. In Kings county they have been thinned. In Riverside they had three nights of cold, including snow and ice. Almonds and peaches also suffered here. In Butte county, smudging as a community proposition saved most of the almonds. Those who used frost pots in Santa Clara county saved their crops, but there was considerable real damage due to several frosty nights. Prunes were not open enough to be hurt. Pajaro Valley apricots seem to have escaped with little damage and the apples were not out. San Luis Obispo IXLs were somewhat damaged but little else was hurt. Apricots of the Pomona district were nicely thinned. About San Bernardino some late peaches were in bloom and these suffered some along with plums, almonds, and apricots. East of Bakersfield 'cots on low ground were damaged some. In Ventura county there seems to have been severe damage to apricots. In Fresno county 'cots were hard hit in some localities, but peaches only slightly touched.

CLEAN CULTURE OF RICE AT SMALL EXPENSE.

[Written for Pacific Rural Press.]

Clean rice culture has been a topic for much discussion among rice growers of California ever since the industry assumed commercial proportions and while many still refuse to expend time and energy to keep their fields clean during the growing season, more progressive growers are finding that such practice materially lengthens the time rice may be grown on land without rotation.

That the cost of clean culture is of minor importance is subscribed to by J. H. Harlan of Woodland, who farmed about 75 acres of his poorest grain land to rice last year and who harvested 38 sacks of good clean seed rice, while most of the rice on the neighboring acreages produced smaller yields of poorer grain, even though it was the first year the land had been cropped to rice.

Early in the growing season Mr. Harlan instructed the workman who was caring for the irrigation water to pull any water grass or off varieties of rice he might find in the checks when going through the field. For a time the man followed instructions, but was persuaded by neighboring growers that it was a waste of time, so discontinued that part of his work.

The next attempt at getting the field cleaned was made by Mr. Harlan's son, but he also succumbed to the neighbors' advice. Convinced of the value of such cleaning, another man was hired who followed instructions till the rice was ready to harvest, with the result that the field was entirely clean.

The chief reason for Mr. Harlan's insistence in the matter was his fear of Italian rice, which ripens earlier than Waterbune, the variety he grows, shattering out badly before harvest time and re-seeding the ground heavily for the next year unless pulled before ripe.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

HOW TO BUILD A FARM PILE DRIVER.

[Written for Pacific Rural Press.]

The floods in Southern California in the spring of 1916 tore out many fertile fields, changed many water-courses, flattened out many creek beds so they would not be confined at all in event of high water, and left remaining good soil in danger of future floods.

Among the common means of protection being installed are piling, driven and connected together to direct the streams along harmless lines. The Yucaipa Land Co. did this last winter on a little job of 116 piling driven at three curves where otherwise there was no knowing what the creek might do. Old telephone poles about 16 feet long and costing \$2 each were used. A \$100 pile driver and three men drove an average of six pilings per day of 9 hours, according to one of the workmen, putting them about 12 feet into the ground. This is certainly no record, and could have been greatly exceeded had a gasoline engine been used instead of the horse, to raise the 1750-pound pile hammer. As their pile driver frame was too elaborate and expensive for any but a co-operating bunch of farmers to undertake, we describe a simpler one based on our experience in building several for bridge work.

Have an iron hammer cast, at least a foot wide, weighing at least 1000 pounds and with grooves on two sides a full six inches wide and not less than two inches deep. Get or splice 4x6 straight grained timbers at least six feet longer than the piling to be driven. These are to be the "leads."

Lay them parallel on the ground with a 4x6 about 12 feet long cross-wise under one end. Bore a 9-16-inch hole through the four-inch diameter of each lead in the center six inches from the end, countersinking it. Cut a shoulder on the outer flat side of each, on that end, 3/4 inch deep and about 11 inches from the end, adzing out the wood 3/4 inch deep to the end. Now lay two 3x12

plank about 16 feet long outside the 4x6s with their ends on the same cross timber. Bore holes through these six or eight inches from the end, to correspond with the holes in the 4x6s. Run half-inch bolts through the leads and the planks (which are to be the "sills"), drawing the nuts up to fair tightness. Now shove the leads ahead so the cross timber they are resting on will be about eight inches back of the end. Fasten the crosspiece to the sills by screw-ended U-bolts so the sills are just wide enough apart that the pile-hammer fits between them with perhaps 3/4 inch play. The cross piece is to brace the pile driver from tipping over sidewise under strain. Spike or bolt a cross piece on the other end of the sills to prevent spreading. Now bore a 9-16-inch hole in the center of the top end of each lead and through a 4x6 cap which is to hold the top ends of the leads at the right distance apart and support the block and tackle by which the hammer is to be lifted. This cap should extend a few inches past the leads on both sides. Raise the top end of the leads and support them by a piece across the sills about their center. Bolt the end of a straight-grained 2x6 to the outside of each lead three or four feet below the top, countersinking the inner end of the hole to prevent the pile-hammer catching the head of the bolt. The 2x6's must be long enough so that when the leads are vertical, they will slope backward and bolt to the sills at an angle of about 60 degrees. Tie your pile-hammer rope to the cap so its ends may be used for temporary guys. Raise the leads by pushing up the 2x6's. When the leads are square with the sills, nail or bolt the lower ends of the 2x6's to the sills and nail crosspieces on them for a ladder. Spike or bolt 2x6 braces from near the top of the leads to the outer ends of the cross-piece 4x6. Run your rope through double and single blocks; and hang them; also a snatch block to run the rope back to the nigger head on the

Save Expense and Trouble

It means a lot more than the purchase price to the man who buys an unreliable pumping engine. The time, worry and expense involved trying to get the engine to run right must be added to the first cost. And finally, more time and expense with your pumping plant out of commission while the engine is being changed for another.

Get the Right Engine First.

Install a Commercial Engine and you will have no trouble or needless expense ahead of you. Write today for our handsome new catalog and post yourself on all the superior features of Commercial Engine Construction. Remember, an ironclad written guarantee protects the purchaser of every Commercial Engine.

engine. Spike or bolt level braces from the leads to the ladder at intervals of about eight feet. Fasten crosspieces on these five inches clear of the leads to hold them stiff. A 2x4 crosswise of any of these or the sills and next to the leads, will hold the pile-hammer wherever you wish. About four feet from the top, bolt strap irons to the leads so they will hold a 2x4 flat against them. This is for the hammer to rest on while you are raising the piling and placing it. An X-brace on the sills or corner braces from them to the ends of the cross 4x6 will keep the frame square when moving. Set the engine on the sills where convenient.

Drive the piling small end down so they will be tight all the way around and up and down. Do not point them or they will shoot to one side when they hit rocks, etc. Trim down the small end to a square about half the diameter of the end. To hold the piling in place as it is driven will require one man with a couple of wooden handsticks about two inches in diameter and four feet long. He will place these between the leads and the piling to prevent it from giving outward. It can be kept from giving inward by laying a gas pipe across the level braces in front of their cross piece if desired, though it can be thoroughly controlled with the handsticks. Keep the leads greased. The hammer trip for the Yucaipa Land Co. was a scissors arrangement which naturally hung closed. In position, the shoulders on its lower ends clutched the triangular block fitted between iron plates which were fastened to the top of the pile hammer. Between the leads near the top but six inches lower than would be absolutely necessary, were sloping blocks which forced the upper ends of the scissors together, thus releasing their hold on the hammer. The six-inch leeway is to prevent undue strain on the rope when the hammer is tripped.

Long moves are made by hitching the rope to a post in the distance and winding it up on the engine, using plank for runners. Short moves are made with crowbars and handsticks.

A new 3/4-inch manila rope is plenty strong to lift the hammer for three months of steady work if not otherwise strained or rotted with internal moisture.

POWER REQUIRED FOR PUMP.

To the Editor: I have a small irrigation plant—3-horse engine and Typhoon pump, 2-inch pipe. For more water I want to install a 2-inch centrifugal pump. Pump sets about 40 feet from river with about 10 feet lift. Lift above pump for irrigation about 40 feet, through 400 feet of pipe. Engine cuts out nearly half with present pump. Have I power enough for centrifugal?

Also, I have to fill a 6000-gallon tank daily, with a lift of 20 feet more—about 60 feet in all. Will centrifugal make this satisfactorily, or would it be better to leave force pump in to fill tank, and use the other for irrigation only? I will have a short turn below pump in pipe, and two above. Will this reduce efficiency much?—E. P.

[Answered by Prof. S. H. Beckett, University Farm, Davis.]

A two-inch centrifugal pump is rated to discharge approximately 100 gallons per minute. On a 30% efficiency basis this size pump will take .08 horsepower per foot lift of water or 3.2 horsepower total for

the 40 feet. Onto this will have to be added sufficient horsepower to overcome the friction of the water in the discharge pipes. Forcing 100 gallons per minute through a two-inch discharge pipe will create an excessive friction head and in order to keep the friction head within reasonable limits the discharge pipe will have to be increased to at least three inches in diameter. With this friction head plus the friction of the water in the elbows plus the horsepower required in raising the water, the horse power of the engine would have to be increased.

Uni-Lectric
GASOLINE-ELECTRIC UNIT
LIGHTING SYSTEM

Electricity for Farm Homes

At one-third cost of juice from Power Company (this includes interest on cost of plant). It is the simplest and most economical plant on the market.

No Batteries - No Switchboard - No Rheostat

Will operate 50 lights 7 1/2 hours for 11c. Will also operate electric fans, irons, small motors, etc. If your buildings are not wired, send us plans and we will give you full instructions so that you can wire them yourselves. Material furnished at lowest cost.

"I'll Drain that Swamp With Dynamite"

The man who is familiar with the use of dynamite on the ranch or farm finds that it serves many purposes. Not the least of these is the draining of swamp land.

If there is any low, wet land on your place, land that heretofore has been unproductive, drain it with Hercules Dynamite and make it pay its way. You will find that by using dynamite you can do the work more quickly, more thoroughly, and at less expense than by any other method.

HERCULES DYNAMITE

naturally gives as good results when used for running irrigation ditches as when used in drainage work. Until you have tried it yourself or seen it done it is impossible to imagine how quickly a ditch can be run with dynamite. There is no dig-dig-dig about it. A line of charges is planted—exploded by means of a blasting machine—and there's the ditch. Or if the land is very wet no blasting machine is necessary; simply fire the center charge with cap and fuse; it will fire the next one, and so on down the line.

Oftentimes wet places can be drained with one charge

of Hercules Dynamite by shattering the impervious subsoil. This involves even less trouble and expense than ditching.

If you have never used Hercules Dynamite in agricultural work write for our 64 page book "Progressive Cultivation". It is sent free on request. It tells in detail how to drain land; remove rocks, trees and stumps; subsoil; plant trees, etc., by the use of Hercules Dynamite. It is fully illustrated and is well worth reading. When you write please use the coupon below.

Control of Abortion in Cattle.

Abortion is a disease so widely disseminated that few herds of dairy cattle are free from the infection, according to Dr. W. I. Williams, Research Professor of Diseases of Breeding Cattle at Cornell University, who lectured before cattle breeders and veterinarians at Sacramento December 26 last.

The infection may even be present in cattle without the occurrence of abortion. When the virulence or disease-producing power of the germs is high, losses occur in the herd from abortion, sterility, retained afterbirth, or diseased ovaries and they also cause diseases of new-born calves such as calf scours, pneumonia, joint disease and similar complications. In infected herds not only the aborting cows but non-aborting cows, bulls, and calves may harbor the infection, and calves and young heifers should be protected. Heifers carrying the first calf are more liable to abort than older cows. The two periods when the germs of abortion infection are most liable to gain entrance to the offspring are at the time the heifer calf is born and at the time she is first served by the bull. The entrance of the germs at these times is especially liable to cause damage. In order to obviate as far as possible the infection, Professor Williams recommends the following procedure to all cattle owners having animals valuable enough to warrant the extra expense:

Care in Breeding.—Before and after service irrigate the sheath of the bull with one-fourth per cent Lugol's solution. It is advisable to administer a vaginal douche of this solution an hour or two before service to cows which do not conceive at the first service. Dr. Williams has discovered that the use of this solution does not interfere in any way with conception. If the cow still fails to breed, enlist the services of a qualified veterinarian.

When the cow has reached her 270th day of pregnancy or earlier, if calving seems probable, give her a thorough bath with warm water and soap, lathering the skin repeatedly until thoroughly clean. Rinse off the soap and water with a one per cent solution of compound solution of cresol. Place the cow in a clean, disinfected stall. After the bathing wash the tail, vulva, thighs and udder daily with warm compound cresol solution, one and a half to two per cent, and douche the vagina daily with one-fourth per cent Lugol's solution.

After Calving.—When the calf is born rub it dry and disinfect the stump of the navel cord. Do not tie it. Do not touch the navel stump with the hands. Fill a goblet or glass to the brim with 1-1000 corrosive sublimate solution and having the calf held on its feet, push the goblet against the navel region so as to submerge the navel stump completely and keep it submerged for fifteen minutes. (Corrosive sublimate tablets can be purchased of a size that one to one pint equals 1-1000.) Then dust the navel stump over heavily with a powder composed of equal parts of powdered alum and boric acid. Place the calf in a clean, dry, comfortable stall and keep it alone until two or three

months old. Do not permit the calf to suck.

Care of Calf.—According to Dr. Williams, it is best in most cases to feed calves on boiled milk. Some very young calves do not thrive on boiled milk, and when it does not appear practicable to boil the milk the following special precautions should be taken to protect the milk for the calf from infection:

Before drawing milk from the cow to feed the calf, wash her thoroughly according to the plan recommended prior to birth. The milker must first disinfect his hands and use a sterile pail. The first milk from each teat should be discarded. Repeat the washing immediately before each milking. Repeat the douches heretofore described daily until all discharges have ceased. At eight or ten days of age nearly all calves may be safely placed on boiled milk. The milk which is boiled may be drawn from any economic source. In order to prevent scorching a large double boiler or water bath should be used to heat the milk.

When all discharges after calving have ceased, the douching of the cows may be stopped, though it would be well to continue the external washing daily in the interest of clean milk as well as of the general health of the herd. When abortion or retained afterbirth occurs, each case should be handled individually by a skilled veterinarian and by the special treatment restored to health as promptly as possible. Much needless loss might be saved by owners of valuable purebred cattle if the services of veterinarians skilled in the special work perfected by Dr. Williams were available. By a monthly or quarterly veterinary examination of all the animals in a herd, cases of sterility will be discovered before it is too late to cure them and incurable or dangerous cases can be eliminated before they have done irreparable damage to the bull or other cows.

Don't Sell Cows.—This does not mean, however, that all animals infected with abortion should be disposed of. As a matter of fact, in herds in which abortions are occurring a cow that has aborted once or twice may be just as valuable for breeding as one that has not. Cows seldom abort more than two or three times. Cows that are not made sterile by abortion will in all probability resume normal reproduction. On the other hand, if they are removed to make way for fresh animals there is a possibility that the newcomers already are or soon will be infected and are more liable to abort than the old ones. The elimination of infected animals is, therefore, not to be recommended as a means of controlling the disease unless their value is not great enough to warrant the expense of treatment.

By keeping pregnant animals, the disease will be brought to a standstill more quickly than if new susceptible material is continually added in their place. Some cows apparently become immune without aborting. It is the history of the disease in the great majority of

Profitable From Every Standpoint

Mr. F. Baumgartner of Joliet, Illinois, uses seven Double Unit EMPIRE Milkers, and says that four men are milking from 100 to 120 cows in one half the time previously required by seven men. His experience and that of thousands of other successful dairymen prove that

are Profitable from Every Standpoint. They will be as profitable for your Dairy. The wages you'll save, alone, will pay for your EMPIRE Outfit. And besides, the labor problem will be solved for you—to say nothing of the extra hours your help can spend in the fields, and the extra quantity and higher quality of milk that usually result from using the EMPIRE.

EMPIRE Milking Machines are simple and efficient—gentle and natural in their action, and above all, they milk the SAME WAY EVERY DAY, more uniform in action than even the calf. They are a safeguard to the condition of valuable cows.

Let us tell you ALL the benefits they offer you. Write for Catalog 45—and also ask for information regarding EMPIRE Cream Separators, Gasoline Engines and Electric Plants.

EMPIRE CREAM SEPARATOR COMPANY

The best recommendations for Empire Milkers that we have seen have come from users. They will interest you. Send for our illustrated pamphlet "What Dairymen Say."

herds that after reaching its height, it gradually subsides of its own accord until only a few slips occur each year or it may disappear entirely. In herds where abortions have not occurred in several years, or at least only rarely, the owner should take particular pains to prevent its introduction. Every case of abortion should be regarded as infectious until proved otherwise.

Scours.—For outbreaks of pneumonia and scours in calves Dr. Williams recommends the frequent use of enemas of physiological salt solution and the daily injection of liberal amounts of calf scour serum in addition to the special precautions to be taken at time of calving mentioned above.

The butter situation East continues bullish. The government's report of stocks in cold storage held by 257 firms March 1, 1917, showed on hand 15,467,475 pounds against 29,808,296 pounds February 1, indicating withdrawals during February of 14,340,821 pounds. On March 1, 1916, there was in store in the hands of 215 firms 15,032,769 pounds against 14,582,975 pounds held by the same firms March 1 this year; 449,794 pounds less than a year ago. It is this shortage in cold storage stocks and the lateness of spring that has caused the market to

High Feed Costs Smashed!

Down they go—to smash! In a HALF! Thousands of farmers are selling their No. 1 hay, milling off grades. They're making the grandest alfalfa chop; fattening hogs, cattle, sheep, poultry and pigs; making it cheaply, easily, with our famous patented Recutter Attachment (suitable for field use). Handles leaves, stems and all; no waste; no injuring color of hay. Makes dandy combination feeds from clover, rice, straw, cornstalks, bean straw, pea vines, oats and rye. Biggest guaranteed capacity! 1200 to 2700 lbs. per hour with Junior Mill (run with 6 to 8 h. p. engine). (Cracks peas, corn and beans.)

SMALLEY SILO FILLER

SEVEN SIZES. Tremendously simplifies silo filling. Grip Hook Force Feed (able automatically feeds cutter, saves wage and board of from one to three men. Makes richest feed, increases silo tonnage.

Flower built independent of cutter. Let your fan spin fast or slow, the speed of knife shaft is unchanged. No belt to slip, wear out, and waste time, money, power. Patented low-speed one pulley chain drive is faster, cleaner, saves 1-4 to 1-3 power cost! Powerfully built. A fourth heavier, with wonderful record for long service.

Write for latest catalog and sample of chop to Pacific Implement Co., San Francisco, Cal., or Smalley Mfg. Co., Dept. 41, Manitowoc, Wis.

hold up as it has and rule higher than a year ago.

A Practical Bull and Calf Barn.

Purebred breeders are coming more and more to the belief that the well-cared-for dairy calf is a better prospect for future usefulness than one which has been stunted by poor or improper care and feed, and that this applies alike to bull and heifer calves.

With a realization of this the J. S. Gibson Co. have erected during the past winter a bull and calf barn that is both sanitary and convenient as well as spacious.

This building is 100 feet long and 36 feet wide, with a loft overhead large enough to accommodate a year's supply of hay. The lower floor is divided in the center by an eight-foot feed alley. The floor of this alley at the end used for calf pens slopes to a drain so that it may be hosed off quickly.

Calf pens are located on both sides of this alley at one end of the barn, hay racks being built next to the outside wall in each pen with feed trough underneath and hay holes in the floor above so that hay can be thrown directly from the mow into the racks.

The partition separating these

pens from the alleyway is partially made of stanchions, a shelf extending along the front of the alleyway providing a place for the milk buckets used in feeding the calves. As this is directly over the concrete floor, any spilled milk is easily cleaned out by the use of hose and water.

The bull pens are for the young sale bulls rather than for the service bulls, they being smaller than the calf pens and each one holding a single animal.

They are all equipped with individual watering troughs, made of lumber and supplied from a master trough which is equipped with a float valve. This keeps all troughs filled to a given height at all times. It is a useful device.

A litter and feed carrier runs the entire length of the building, over the alleyway, and outside corrals are provided for each stall or pen on both sides of the building so that ample exercise may be secured. Not only does the barn insure better health of the young stock, but better growth also, as the cold winds and rains do not affect them.

Making Silage Overdo its Mission.

[Written for Pacific Rural Press.]

"My silo has been a life-saver." Such is the answer pine out of ten dairymen in the Sacramento Valley who have had a silo to feed from the past winter will give you when questioned as to their experience.

Probably there are other similar experiences that could be related which would tell of the benefit of a silo better than the following, because they would show better judgment in the balancing of feeding stuffs; but here at least was the story a small dairyman told us while attending a farmers' meeting not long ago.

Two years ago he erected a small silo having a capacity of about 65 tons. During the winter of 1915-16 he had alfalfa hay to feed with his silage; but high prices appealed to him in the fall of 1916, with the result that he had nothing but a silo

full of Indian corn to go through the present winter with.

Apparently, he says, the cows ate greedily of the silage ration till about the middle of April when a little grass started to grow in his pasture. Before that time his cows had held up well in their milk despite the cold winter, and were in apparently as good flesh as ever. But as soon as they got a taste of the green feed they refused to eat heartily of the silage, their milk flow dropped off some and he was anxious to know what was the matter with his silage.

Of course it was natural for his cows to want a change of diet and he had overdone the silage. But he has carried his cows through the winter when, as he says, "I'd have gone out of the dairy business but for the silage."

SKIM MILK FOR DAIRY COWS

To the Editor: I have a surplus of skim milk and would like your advice on the value one would get in mixing it in the beet pulp and cocoanut in feeding it back to the cows.—L. W. F., Cupertino.

[Answered by Prof. F. W. Woll, University Farm, Davis.]

Several years ago the question of feeding skim milk to dairy cows was repeatedly discussed in the dairy press, and practical experiences were published of farmers who had adopted this method of utilizing the milk. There has been no mention of this practice of late years, however, so far as I am aware, and it is a fair inference that it is no longer followed, or has been adopted only in very exceptional cases. Trials that were made at the time showed that better value was obtained in feeding the skim milk to hogs or calves than to cows.

If the correspondent has a surplus of skim milk above what the young stock will take, there will be no difficulty in getting the cows to take it by mixing it with beet pulp and

cocoanut meal, as suggested; its value for this purpose would very likely be about one-sixth to one-eighth that of an equal weight of grain.

RIDDING HOGS OF LICE AND FLEAS.

Hogs as well as hog-house floors may be kept free of lice and fleas by bedding with coarse shavings that have been well sprinkled with crude oil.

Such has been the experience of Jack Finlay, herdsman of the swine herds at the University Farm, who says that since he began with this method his hogs have been entirely free of lice, except on small spots back of the ears which are not touched with the bedding ordinarily. By the use of a spray pump and disinfectant on these parts once in a while, however, the hogs are kept entirely free of vermin.

Where shavings are not available straw will answer the purpose fairly well. Either are simple remedies and much more economical than

Remco

SILOS TANKS PIPE

For dairymen, farmers, feeders in all sizes and proportions.

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

Sold direct to users.

Paddy Rice for Livestock.

[Written for Pacific Rural Press by H. O. Jacobson, Butte City.]

Rough rice has been the leading stock food for centuries in the Orient; for there it is the cheapest available grain. The Chinese and Malays are very familiar with the fact that fattening ducks, geese, and chickens with rice imparts a flavor and texture to the flesh obtained by no other means. The enormous numbers of swine killed annually in China are, of course, mostly fattened on rice.

The hulls of rice fall off readily. When rice is fed to swine, a careful observer will notice that in eating the paddy the hog will reject a considerable proportion of the hulls, but will manage to retain the kernel. This causes slow eating, more complete mastication and more perfect assimilation. If examination is made of the manure passed by horses and mules, cattle or hogs fed with rough rice it will be found that seldom does a hull, apparently whole, contain the kernel. The percentage of hull in rice ranges between 13 and 16 per cent by weight. Rolling the rice assuredly puts it into a better

form for feeding out to livestock.

The writer has had under observation this winter about 1500 hogs pastured on rice stubble. The hogs varied in age from 12 weeks to two years. Not one of them appeared to suffer from any unfavorable action of rice hulls, but all did well, ordinary hogs of badly mixed breeding weighing about 150 lbs. when put on the stubble gained 75 to 90 pounds in 60 days.

At the present time we are feeding rolled rice to 150 head of mules and horses, which are doing heavy work, in connection with grain hay or volunteer hay, and the stock is being maintained very well. The teamsters are perfectly satisfied with the feed. The daily ration per animal is about ten pounds.

Basing our judgment only on our experience, we believe rice has no local superior for fattening swine. Very ample corroborations of this statement can now be obtained in the California rice districts, especially the older ones, notably about Richvale, Biggs, and Gridley.

Community Building with a Dairy.

(Continued from 1st page.)

years it is expected that vetch, Canadian field peas, sweet clover, rye grass, and root crops will contribute their share toward the necessary supply of dry weather feed as well as provide rotation crops for fertility-building. Corn was tried last year and did very well on about two and a half acres that were sheltered from the ocean wind by eucalyptus trees; but the balance of the 13 acres planted did not yield well. Beets and carrots are already proved crops in the section; and as these furnish succulence in the fall and early winter, a six-acre piece will be planted this season. Rye grass and clover as well as sweet clover will be planted on the low pieces of overflow land, with the idea that they will withstand the excessive moisture of winter and still yield a large amount of feed and provide excellent pasture at certain times of the year.

Besides the rotation of the above crops, all of the manure will be applied to the land systematically, rather than haphazardly. As a further aid in breaking up the fertility elements of the soil, superphosphate and limestone were applied last year. The fact that this work is being undertaken by the community's staunchest business family and banking counselor, as well as one of the largest land-holding companies in the district, is having the effect that the LeBarron Co. wished—more serious thought as to the future welfare of the community followed by more progressive action.

The entire work is figured on a business rather than a philanthropic basis, for as sure as the world every dollar added to the community by more progressive methods will materially benefit all business, including the bank and the large landholder looking for a tenant.

Chute for Rapid Dehorning of Cattle.

[Written for Pacific Rural Press.]

De-horning 500 yearling steers in a day and a half was the record set on the Stanford University's ranch at Durham this spring by Superintendent J. F. Van Loben Sells and Managing Foreman F. C. Franklin as a result of a simple but efficient de-horning chute and stanchion.

This chute, which is built of heavy lumber, as are the corral fences, is long enough to hold a number of steers. The steer cannot back out when a piece of two by four is placed across the chute in slots cut for the purpose.

Access to the chute is gained from the holding corral, and exit is made into an adjoining corral. At the end of the chute a heavy stanchion was built, its uprights extending beyond the frame work of the top of the chute about two feet and each being equipped with a small pulley close to the top. When in operation a small rope is securely fastened to one of these uprights and then carried through the pulley on the opposite swivel, then back again through the one it is fastened to. A man stands several feet away from the stanchion, and as soon as the steer is driven in and blocked from behind, so he cannot back out, a quick jerk is given the rope, pulling the uprights up tight around his neck and holding his head secure while another workman clips off the horns with de-horning clippers. An application of tar and sheep dip quickly follows; the heavy door on the side of the chute is opened, the rope let out, and the job is done. By that time another workman has another steer ready to put into the stanchion.

ORMONDALE SHORTHORNS

Golden Goods, Jr., Herd Sire.

Our 1916-17 offering of yearling bulls is small but select. They are all heavy boned, solid red in color and of Scotch and Scotch-topped breeding. Suited for either the range grower or breeder.

DUROCS.

Our Durocs are of the big type, with big bone, well-arched backs and carrying good hams.

We have a few head of service boars, now ready for service, solid red in color and out of prize-winning animals.

Every Animal Positively Guaranteed

Whether you buy or not, visit our ranch, 7 miles from Palo Alto on Woodside Road. We welcome inspection. Prices and pedigrees on application.

Los Angeles Hog Raisers Handicapped.

To the Editor: On Feb. 27, 1917, the Los Angeles County Board of Supervisors passed a very drastic ordinance which is designed to make the garbage hog feeders clean up and keep clean; it tells them how they are to handle the food and how it shall be fed. It provides for every swine breeder in the county to obtain a license to carry on his business and also provides that the owner shall pay a fee of \$3.00 per hundred hogs or fraction thereof every three months. Do you know what we are up against? We are feeding \$50.00 grain, \$16.00 hay and various concentrates which cost \$40.00 to \$60.00 per ton. We are compelled to market in one of the poorest livestock markets of this country. We take our hogs to Los Angeles and ask the packer to please give us all that he can for them. On the Pacific Coast there is but one union stock yards where hogs are sold at auction, and where the best hog gets the best price; this is at Portland, Ore. At Sacramento, Cal., a union stock yards is to be built immediately. At San Francisco one packer pays for hogs on their dressing percentage. Los Angeles, except in a very few instances, does not discriminate between a good hog and a poor one, when he is buying it. We take what we can get and say thank you. We of Los Angeles county are unable to get our stock to any other market reasonably enough, so that we can force the Los Angeles packer to pay

more. The packer would laugh at us if we asked him to pay us for the expense we were put to in complying with your ordinance. Ordinarily we do not get our hogs on the market in less than 9 months; a car of hogs numbers 80 to 100 head. To pay for the fee you ask, we would have to get \$9.00 per car more than the Kern county breeder, the Ventura breeder, the Imperial breeder or any other breeder so that we could compete with him on an equal basis.

Not one-tenth of the hogs killed in the county are raised here. If this ordinance is put in force as it now reads, all of the hogs killed here will be raised elsewhere. Your act so discriminates against the legitimate industry of swine raising that we will be forced out. To you it may seem a small matter, when you ask us to pay \$3.00 per quarter per hundred hogs. To us it is a great big thing, because the cost of everything to us is increasing, and because we are unable to get the money back. The dairyman makes the consumer pay for his cleanliness and inspection, etc., as does the hotel keeper or the saloon keeper, but we are powerless to get that money back. If we ask the packer to pay it to us, or if we insist on having it he simply will pass up our hogs and buy from a breeder outside of this county who is not handicapped by any such license and fee.

Donald H. Graham.

Antelope Valley.

Dairy Laws Pending in Legislature.

[Written for Pacific Rural Press.]

A number of bills introduced into the 1917 legislature have to do with the regulation of dairies in California. A few of these are summarized in the following:

Assembly Bills 475 and 476 are amendments to the present dairy laws designed to relieve the dairyman with less than four cows from all control or inspection by the State Dairy Bureau or other sanitary commissions.

Assembly Bill 948 would repeal in whole the dairy law passed by the legislature of 1915 which calls for tuberculin testing of dairy cows or pasteurization of all market milk sold for human consumption, also the grading of milk.

Assembly Bill 1124 is designed to include butter as a dairy product under the 1915 bill. It would require all cream used for the manufacture of butter to be either from tuberculin-tested cows or pasteurized

before being used for manufacture.

Assembly Bill 1337 is a revision of the 1915 law above referred to. The bill provides for the grading of market milk, but proposes to lower the score under which certain grades can be produced. It also provides for the marking of reactor cows with a small "T" in the ear. While it includes butter as a dairy product it allows the use of the "flash" system of pasteurization of cream. It also calls for the branding of all butter sold in boxes or cubes with either the words "pasteurized" or "from non-reacting tuberculin-tested cows" requiring the name of the producer of such butter.

Assembly Bill 1123 is a bill similar in design to the one above noted but less explicit and paying more attention to market milk than to other dairy products. It also includes butter and provides for the marking of all reacting cows.

Rice and Rice Straw for Horses.

Rice straw as a roughage for horses, mules, beef cattle and sheep holds much promise to the livestock grower in the rice districts, as a result of experience in using it the past winter and spring when other roughages were scarce and high priced.

Among others who had satisfactory results with this new feed was the Tweede Ranch and Land Co. of Glenn county, who fed chopped rice straw to their work stock and cattle all winter. They state that their

stock is in as good condition as when fed other higher-priced feeds in other years.

According to Mr. Tweede, rice straw has a higher feeding value and is more palatable than straw of the other small grains, because it is cut when green instead of after maturing, thus leaving a large percentage of the nutrients which would otherwise go into the head, in the straw.

Ground or whole paddy rice is also recommended as a horse feed by J.

Do You Want Long Distance Breeding?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by **PRINCE ALCARTRA KORNDYKE**, whose dam is **TILLY ALCARTRA**.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

"THE NAME GIBSON INSURES QUALITY."

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

L. Mendenhall of Colusa county, who has fed his work stock a ration of one-third barley and two-thirds rice with entire success the past year.

LIVESTOCK IN GLENN CO.
Ord Leachman, Market Agent for the Glenn county Farm Bureau,

shipped two carloads of cattle and hogs from Willows and a carload of cattle from Orland early this week. As a result of his work prices on all kinds of livestock in Glenn county have been materially improved. He will ship three carloads of hogs to Portland later in the month.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

Glenn county Jersey breeders organized Oct. 17.

A. R. Bates of Modesto becomes a member of the State Dairy Board to succeed E. P. Nissen.

Visalia Co-operative Creamery paid \$26,980 for February fat. About 79,900 pounds of butter were made.

Kings county dairymen received \$185,000 Mar. 15 for February cream at 42 cents per pound for the fat in it.

The highest butter score at the California Contest Mar. 7 was made by P. Peterson of the Valley Flower Co-operative Creamery of Ferndale. It scored 94½.

The American Jersey Cattle Club has just issued a sheet showing the "Highest Yields of Jerseys." Sophie 19th of Hood Farm leads with 999.1 pounds fat in a year.

The Napa County Livestock Ass'n met Mar. 3. E. C. Voorhies of University Farm faculty told them that no man can tell the fat content of milk by looking at it.

D. D. Williams, H. P. Hopgood, W. M. Paine, F. M. Paine, M. Grafton, and T. M. Clark of El Centro have recently placed orders for a 100 ton Indiana silo for each.

Sealed cans for cream are advocated to prevent mixing cream of different quality so all producers may get price according to quality.

Milk produced in U. S. according to Sec. of Agriculture D. F. Huston increased from 7,506,794,000 gallons in 1914 to 7,696,844,000 gallons in 1915, to 7,959,656,000 gallons in 1916.

The new shoots of alfalfa are the parts which cause bloating, according to the University of Arizona.

J. B. Brite of Tehachapi recently sold a carload of 91 hogs at \$12.25, a total of \$1830, to Los Angeles packers.

A detailed study of the cost of producing milk on four farms, recently conducted by the United States Department of Agriculture, leads to the conclusions that on those farms feed accounts for one-half or more of the total cost, the remaining charges being divided equally between labor and other items, such as shelter, use of equipment, use of bull, interest, depreciation, and overhead.

SWINE AND SWINEMEN

An experiment at University Farm to learn the relative value of milled threshed dry and soaked and on the head for hog feeding will be shown to visitors at the picnic April 28.

John Meyers of Ohio, who for the past two years has been field man for the American Berkshire Ass'n, will arrive here this week to take charge of the Carruthers Berkshire herd at Mayfield, for a year.

Elmer Lamb of Ceres reports sales of purebred Durocs since the last State Fair to C. J. Boyd, Hickman; John Estillarte, Modesto; Sadie B. Fowle, Denair; Sydney Smith, Hughson; E. W. Beebe, King City; D. Power Booth, Ceres; H. J. Sherwin, Tonopah, Nev.; Andrew Schendel, Turlock; H. J. Layman, Maxwell; Jack Mongovan, Point Arena; Clifford Farms Co., Strathmore; F. E. Dickie, Vacaville; F. S. Ingram, Willows; H. P. Jorgensen, Snelling; Geo. E. Spencer, Blythe; Berglund & Sundstrum, Turlock; L. A. Welch, Chowchilla; S. P. Summers, Ceres; Chas. L. Metzger, Manzanar; L. S. Pardee, Hughson; V. C. Hague, Fresno; A. J. West, Hughson; A. R. West, Hughson; C. J. Bucholz, Merced; Ralph Lockie, Merced; Dr. Geo. E. Spencer, Sacramento; Earl N. Dargitz, Acampo; and Nicholas G. Jesch, Northam, Nev.

BEEF AND SHEEP.

Oakland is considering a municipal abattoir.

Hay stored for 16 years near Klamath Falls is being fed to stock.

Practically the whole of the wool and textile trade of the United Kingdom is under government supervision.

Argentina exported over 80,000 tons of wool Jan. to Oct., 1916. This is over 6,000 tons less than for the same period in 1915.

Swift & Co. of Chicago have recently purchased 42,000 acres of the Chowchilla ranch in Madera county. The price is said to be \$2,000,000.

S. Traywills of Selma succeeded in getting 148 per cent of lambs in spite of cold weather and poor feed this spring. The ewes are high grade Shropshires.

The Sheepmen's Protective Ass'n was recently formed at Dixon with J. D. Grady, secretary, to urge the legislature to require all dogs to be tagged or subject to killing.

A meat packing plant in Fresno county owned by the Universal Meat Packing Co. of Fresno and built on a \$14,000 site donated by Fresno stockmen and merchants, seems practically assured.

G. P. Rixford of San Francisco, special agent for U. S. Dept. of Agriculture, reports a large new acreage of Deglet Noor and other varieties of date palms being set out in the Coachella and Indio sections.

Siskiyou County Health Officer Dr. J. Roy Jones and the County Supervisors are inaugurating a campaign to eliminate rabies, principally by poisoning the coyotes, says the Scott Valley Advocate.

El Dorado County supervisors seem to have struck the wrong note in abolishing the office of County Horticultural Commissioner; for growers soon held a meeting endorsing the Commissioner's work.

It is said that the Secretary of Agriculture has authorized Supervisor Chariton of the Angeles National Reserve to advertise for the grazing of 4200 head of horses and cattle. There are now about 6000 on the reserve.

News comes from Bakersfield of the sale of the Landers stock ranch near Isabella to T. F. Doyle of Santa Ana. The ranch contains 4000 acres of grazing land on the south fork of the Kern River. The price is said to be \$150,000. Two thousand cattle go with the ranch.

The Stockton Independent prints figures showing that U. S. uses 600,000,000 pounds of wool per year. The clip of U. S. has decreased in five years from 325,000,000 pounds to 288,000,000 pounds. The clips of Australia, New Zealand, and Argentina also have decreased.

Sheep growers as well as hog raisers have made good use of the rice stubble in the Sacramento Valley this winter, finding the rice that is left at harvesting time an excellent fattener. Feeders report no ill effect from the rice hulls on the paddy rice after several months feeding.

An increase of 25 per cent in grazing fees on all national forests instead of 33½ per cent increase as contemplated, will be made for 1917. The charge is to be made according to the value rather than according to administrative cost, to prevent national forest profits from going to a few stockmen.

Superintendent Frazelle of the Fennell Land Co. is en route from the Middle West with a carload of registered Shorthorns. Most of the shipment consists of heifers which will be used as a nucleus for a purebred herd at the company's ranch in Tehama county. H. L. Murphy of Perkins and W. H. Hammond of Chico,

both Shorthorn breeders, accompanied Mr. Frazelle.

W. M. Carruthers of Mayfield writes: "Regarding the fifteen matured, registered Shorthorn cows which we are putting in our sale on May 2, they will either have calves at foot or be far along in calves, guaranteeing them breeders. Among them will be Golden Queen, which we consider one of the very best two-year heifers in America. She will be hard to beat this year at any of the fairs on the Coast; also Roodwood Ury, a three-year cow, which will be eligible to show this fall, with a calf at foot. Both of these cows are sired by Count Avon, the International Grand Champion. Lady Dorothea 6th, also to be sold, is a large red cow and will have a calf at foot the day of the sale. The Dorothea family is one of the best families of the Crookshank strain. A Dorothea was Grand Champion at the Portland Exposition; a Dorothea was Grand Champion at the last International at Chicago; a Dorothea was the mother of Ringmaster, the only bull who was four times Grand Champion at the Kansas City Royal. Many of the other cows are Orange Blossoms Minas, and other good Scotch families."

HORSES AND MULES

Applications for registration of stallions have been coming to Sec'y C. W. Paine of the California Stallion Registration Board at the rate of 25 per day.

The Kings County Jack Ranch recently sold a jack to the Camera Ranch Co. of Ventura for \$3,000, and one to Pete Muller, Gustine, for \$1250.

Jack Barrymore, the world's champion saddle horse, was recently shipped to E. D. Moore of Columbia, Missouri, by H. B. Thornberry of Stockton, to be prepared for the coming campaign for saddle horses this season throughout Missouri, Kentucky, and elsewhere.

MISCELLANEOUS.

Yolo County Fair Oct. 4 to 6.

Fresno, Kings, and Kern counties are mixed as to Fair dates.

A woman graduate of University of Cal. expects to become a veterinarian. There are only two women veterinarians in U. S.

An auction sale of Holstein-Friesian bulls will take place on Thursday, May 24, at the Third Annual Butte County Spring Exposition to be held in Chico May 21 to 26. Twenty head from the best breeders in the State will be sold by the California Breeders' Sales and Pedigree Company.

WASCO HOG AUCTIONS.

Kern County Farm Adviser Geo. C. Kreutzer writes as follows: "At our first hog auction at Wasco Feb. 10, we disposed of about \$5,000 worth of stock, the top price being \$9.40. The second sale was held at Wasco March 10, and approximately \$9,000 worth of hogs were sold by auction, the buyers being well represented. The top price for carload lots was \$12.70 per hundredweight. Hogs, a little light, but grain finished, brought \$12.60, and one car was sold at \$12.50. All the above prices were f. o. b. Wasco. In all about 20 different lots of hogs were brought in by the ranchers and the whole institution was conducted by the Farm Bureau. Three per cent commission was charged by the Marketing Department, which, of course, leaves a comfortable profit in their treasury, either to be used by the Farm Bureau to make improvements in the sale yards in the way of scales, or to be refunded as a dividend to farmers who sold fat stock. Bringing the farmers together in this way seems a desirable thing, as the various types of hogs are studied in accordance with the prices, and at the same time it seems to suit the buyers in that they can come to one of our communities in one day and purchase what we have to offer."

WASTING TEN YEARS WITH SCRUB BULLS.

[Written for Pacific Rural Press.]

J. R. Gallagher of Bodega, Sonoma county, has been dairying 18 years; but the first 10 years he wasted because he used scrub bulls, according to his own version of the matter.

Like many dairymen Mr. Gallagher thought a bull was a bull in those early days; and it took a long time to convince him that the only sure and economical way of building up a herd of dairy cows is through the use of purebred bulls.

The original stock on the ranch when Mr. Gallagher took charge was of Durham breeding, selected as is so often the case by guessing at the amount of butterfat in a bucket of milk. When he finally became converted to the better bull idea, he decided to use Jersey bulls on Durham cows; and like others who have tried this cross, he realized good results.

But he does not content himself with simply a registration paper along with his purebred bulls. He selects big-framed bulls from families that are usually large-framed, as well as from heavy producers, and from those having good-sized teats. By this method he is able to raise grade Jerseys larger in size than the average, and ones having good teats as a rule.

At first he depended upon the creamery returns as a check on the results he was securing from the better bulls; but for the last three years he has had his entire herd tested in the local cow-testing association, of which he is president and all round booster. As a result of this he is able to select his cows with more precision and accuracy. In relating his breeding experience he says that he has increased the average production per cow fully 100 per cent since he began using registered bulls.

But as with all breeding experiences, Mr. Gallagher's methods of feed and care have also been contributing factors. When he took charge of his present ranch it had been heavily overstocked, as is so often the case nowadays in the coast districts of California. His first step was to reduce the number of cattle carried on the place by about half, giving the grass a chance to grow and seed, rather than keeping it pastured down close in the growing season.

To still further aid in this work as well as to milk the year round, instead of during the grass season only, he feeds concentrates and hay from early in the fall till about the first of April as a rule, at which time the pastures are good enough so the cows do not fall off in production when on pasture alone.

The mill feeds usually used are coconut meal, dried beet pulp, dried brewer's grain and malt sprouts. These are fed in equal parts by weight, a good big scoopful per cow being the regular ration fed twice a day. Both alfalfa and grain hay have been fed in connection with this ration the past season, Mr. Gallagher preferring alfalfa hay in the dry seasons of the year, but finding grain hay more satisfactory when there is some green feed. Because of the high price of feeding

stuffs the past winter the above ration has cost 14 cents a day per cow; but normally it is fed for 11 cents a day.

Still another advantage which results from the better feeding practices on this ranch is the physical condition of the cows when green feed comes on. Particularly is this true in a winter like the past one. On other ranches in the district we noticed many cows in a starved condition for lack of supplemental feeds; but on Mr. Gallagher's ranch the cows were in good condition, though they had been milking a pound of fat all winter. In this condition they are able to take full advantage of the green grass and put the succulent feed into the pail instead of onto their backs.

CALIFORNIA Hog Book

A Practical Treatise on Hog Raising in California

By W. S. Guilford,
Director of Agriculture, Sacramento Valley Irrigation Company and a practical swine breeder.

First Edition—1916
256 pages of text; 31 pages half-tone engravings, besides line cuts. Cloth bound.

The author has had large personal experience in hog breeding, besides the opportunity of observing many plants in this and other States. He has brought together a wealth of practical and scientific information concerning the hog, its anatomy, the breeding, feeding, marketing, as well as diseases and remedies.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

Chester Whites.

BILLIKEN HERD OF CHESTER WHITES—The type that is ready for market in 7 months or less. The easiest feeders of all. Buy now before prices advance. The price of market hogs is going out of sight. Twenty bred gilts due to farrow in May and June. Forty pigs, both sexes, four months old. Write for Circular and Booklet today. C. B. Cunningham, Mills, Cal.

REGISTERED IMPROVED CHESTER WHITES—Grizzly Bear Ranch, East Auburn, Cal.

Essex.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

Hampshires.

BELLA VISTA HAMPSHIRE SWINE—from prize-winning stock. J. W. Henderson, First National Berkeley.

DAIRY CATTLE.

Holsteins.

FOR SALE—From 1 to 70 extra fine, straight well-marked, light-colored, registered Holstein heifers, from 8 to 20 months old. Those old enough are being bred to a first-prize son of Prince Gelsche Walker, whose dam has a high yearly record. Some of these heifers are sired by bulls whose dams have from 35 to 37 pound records. They carry the very best blood of the breed and are good enough for any herd anywhere. Prices to fit any pocket-book. Geo. A. Smith, Corcoran, Cal.

GRANDSONS OF HENGVERVELD DE KOL and out of A. R. O. cows for sale. Prices reasonable. Write for pedigrees. Many years of constructive breeding has made my herd one of the prominent ones of the San Joaquin Valley. R. F. Guerin, Visalia, Cal.

REGISTERED HOLSTEINS—Herd sire King Komdyke Hengerveld Ormsby 7th, 86623. His full sister as Junior 3-year-old made 32.04 lbs. butter in 7 days. The record of his dam and his sire's dam averaged 30.98. George Kounias, Modesto, Cal.

CHOICE HIGH GRADE Holstein cows and heifers—Springers and open. 15-16ths pure. Heavy producers and of correct dairy conformation. Priced right. In calf to 31-lb. Bull. Write or wire Kenmoor Farms, Oconomowoc, Wisconsin.

REGISTERED HOLSTEINS—Grandsons of King Segia and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

WANTED—14 or 15 young high grade Holstein cows, tuberculin tested and good for at least 300 lbs. butter. To freshen in April and May or September and October. C. E. La Bouteaux, R. F. D. 1, Arcata, Cal.

FOR SALE—Carload or less, full-blood, unregistered, tuberculin-tested cows and heifers. 3-year-old Holstein bull from registered sire and dam. All in fine condition. R. S. Burrough, Cloverdale, Cal.

TULARE GUERNSEY AND HOLSTEIN Farm is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Hirdon, Tulare, Cal.

THE MCCLLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

FOR SALE—Purebred Holstein bull and 20 high-grade Holstein cows. Also 20 dairy Shorthorns. Ed T. Morgan, Northam, Nevada.

J. H. HARLAN, WOODLAND, CAL.—Breeder of Registered Holsteins. Sold out at present. Watch for announcement on King Valdessa.

PACKWOOD FARM HOLSTEINS—Fine young bulls of serviceable age out of tested A. R. O. cows. W. F. Mitchell, Visalia.

FOR SALE—Two registered Holstein cows with A. R. O. records. Write for particulars. J. W. Benoit, Route C, Modesto, Cal.

THE HENDERSON CO.—Breeders and importers. Registered Holsteins. Sacramento Bank Bldg., Sacramento.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier, Cal.

REGISTERED HOLSTEINS—A. W. Morris & Sons, Corp., Importers and Breeders. Woodland, Cal.

CREAMCUP HERD—Registered Holsteins Pontiac bull calves. M. Holdridge, Modesto, Cal.

REGISTERED HOLSTEIN CATTLE—E. E. Freeman, Route B, Modesto, Cal.

REGISTERED HOLSTEIN BULLS for sale. Sunnyside Ranch, Willits, Cal.

REGISTERED HOLSTEIN BULLS for sale. C. L. Morse, Route B, Modesto, Cal.

BREEDERS OF REGISTERED HOLSTEIN Cattle—McAlister & Sons, Chico, Cal.

REGISTERED HOLSTEIN BULLS, \$50 to \$150. Glorieta Stock Farm, Woodland, Cal.

GOTSHALL AND MAGRUDER—Breeders of Registered Holstein-Friesians. Ripon, Cal.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, Cal.

REGISTERED HOLSTEIN-FRIESIAN CATTLE—J. M. Campbell, Escalon, Cal.

BREEDER OF HOLSTEIN-FRIESIAN CATTLE—Dr. Ben Stetson, Napa, Cal.

A. R. O. HERD OF HOLSTEINS—Alex. Whaley, Tulare, Calif.

Jerseys.

JERSEY BULLS AND BULL CALVES—Sons and grandsons of 2 and 3-lbs. cows. None better. Cheap for quality. N. H. Locke, Lockeford, Cal.

VENADERA HERD OF JERSEYS offers calves from Register of Merit Cows with official yearly records. Write for list of bulls. Guy H. Miller, Route 1, Modesto, Cal.

CHOICE REGISTERED JERSEY FEMALES.—Fresh and Springers. Breeding and individuality the very best. McLouth, Orland, Cal.

BREEDER OF REGISTERED JERSEY Cattle—Duroc Swine. Young stock for sale. W. J. Hackett, Ceres, Cal.

JERSEY BULLS AND HEIFERS from Register of Merit Cows for sale. C. G. McFarland, R. 2, Tulare.

YOUNG REGISTERED JERSEY BULL Calves at reasonable prices. O. J. Ames, Oakdale.

JERSEY BULLS—Sons of Gertie's Lad and Gertie's Son's Victor. A. A. Jenkins, Tulare, Cal.

REGISTERED JERSEYS—Young bulls and bull calves. T. B. Purvine, Petaluma, Cal.

JERSEY BULLS from Register of Merit cows. C. D. Hayworth, Modesto, Cal.

Guernseys.

PACIFIC GUERNSEY HERD—Cattle selected from best Imported and Advanced Register Stock. Now offering choice bulls. C. S. Rasmussen, Leta, Cal.

EDGEWOOD FARM GUERNSEYS—First in the show ring and in official records. For animals of either sex for sale. Edgewood Farm, Santee, Cal.

BELLA VISTA GUERNSEYS—Males from A. R. O. dams, \$100 up. J. W. Henderson, 1st National, Berkeley.

Ayrshires.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Bldg., San Francisco.

AYRSHIRES—Registered—75 head. All ages. Young stock for sale. Le Baron Estate Co., Valley Ford, Cal.

BEEF CATTLE.

SHORTHORNS—Herd headed by grandson Whitehall Sultan. Calves sired by \$10,000 Prince Imperial for sale. One or a carload for sale. Get our prices before buying. Butte City Ranch, Box P, Butte City, Glenn Co., Cal.

SCOTCH AND SCOTCH-TOPPED SHORTHORNS—We have the largest herd of straight Scotch cows in California. Foundation stock of both sexes for sale; also a choice lot of range bulls. Barco Ranch, Hollister, Cal.

D. O. LIVELY STOCK FARM, INC., 216 Hobart Bldg., San Francisco, breeders of Hereford cattle. A few choice heifers for sale. We buy and sell livestock on commission. Farm at Mayfield, Cal.

REGISTERED YEARLING SHORTHORN Bulls—Heavy-boned, thick-meated Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, Cal.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain. Choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

REGISTERED AND UNREGISTERED—Shorthorn bulls for sale. Palacios Ranch Co., 320 Sharon Bldg., San Francisco.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

HOPLAND STOCK FARM—Registered Shorthorns. Prices on application. Hopland, Cal.

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Esparto, Cal.

SIMON NEWMAN CO., Breeders of Registered Herefords. Newman, Cal.

GEORGE WATTERSON—Breeder registered Herefords. Bishop, Cal.

SHORTHORNS—Fair Oaks Ranch, Willits, Cal.

SHEEP AND GOATS.

F. A. MECHAN ESTATE, Petaluma, Cal.—Breeders and Importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

SHROPSHIRE—Ewes and Ewe lambs for sale. International winner heads stock. Butte City Ranch, Box P, Butte City, Cal.

KAUPKE BROS., WOODLAND, CAL.—Breeders and Importers of Hampshire sheep.

DORSETS AND ROMNEYS—Dorset ram lambs for sale. John E. Marble, Los Angeles.

BISHOP BROS., SAN RAMON, CAL.—Breeders and importers Shropshire.

CHAS. KIMBLE—Breeder and Importer of Rambouillet. Hanford, Cal.

HORSES AND MULES.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climate and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

ATTENTION, STOCK MEN! Population increasing, meat decreasing. Greatest rush in years for Government and State land. Free homes. Safe investments without residence. School, State, Indian, Government lands. Now available. You have nine rights now worth \$1,000 each. Booklet and 640 acre Homestead Circular Free. Write Joseph Clark, Sacramento, Cal.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Alfalfa Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Fast Pig Vaccination Carefully Done.

[Written for Pacific Rural Press.]

We watched Dr. R. W. Ritter of Imperial county vaccinate a lot of pigs averaging 40 to 50 pounds, for L. B. Rogers, not long ago. There was no cholera in the herd and the 300 vaccinated that afternoon were simply insured against the disease at a cost of about 40 cents per pig. Since these pigs are likely to sell at \$16 to \$20 each, the insurance cost 2 to 2½ per cent. Lots of farmers without similar insurance have lost their work, feed, and stock for a whole season or longer.

About 190 pigs of similar size were corralled while the doctor prepared his outfit. It took an hour to vaccinate them. A box was set just over the low fence beside which he was to work. A bucket of creolin solution and sponge or cloth to wash dirty pigs was put handy. The bottles of serum and virus, with labels properly attached to show the date after which they must not be used, were set out. A cup was provided for the disinfectant for the point of injection, and a brush like a wide toothbrush was used to apply it. Syringes for virus and serum had graduates; and a nut on the handle of each could be turned to the right point so enough but not too much could be used at one injection. The serum syringe held 60 c.c. or enough for three average pigs. The virus syringe held less, for only one c.c. of virus is used per 20 of serum. Needles for both are removable, and of course hollow. They were ¼ inch long for the virus and twice as long for serum. The disinfectant was half iodine and half alcohol, which is as good and less expensive than all iodine. A hollow needle was provided to stick through the corks of the virus bottles. To fill the syringe with virus, its needle was taken out and the syringe fitted down over the needle in the cork. The whole thing was then tipped upside down and the syringe handle pulled back to withdraw virus from the bottle. Thus no virus could touch anything outside nor could foreign matter get into it. The serum was simply poured into a cup from which its syringe was filled once for every three pigs vaccinated.

The end of the corral was paneled off about 6x8 feet and a bunch of pigs run in whenever needed. Thus it was handy for one man to catch

a pig while one held another for the doctor to vaccinate.

The man holding the pig would lean against the fence, grasp the pig's hind legs, holding its back against his stomach and its head between his knees. Meanwhile the doctor took both syringes into his left hand, and with his right hand washed the dirt off from between the hind legs and the belly with creolin solution if it was dirty, and disinfected the surface with his iodine brush in every case. Then he shoved the virus syringe needle through and under the skin at a point just below the deepest hollow between ham and belly as the pig was held with his legs in line with his belly. The handle shoved to the set-nut injected the virus and the syringe was withdrawn. Immediately changing to the other side of the belly, about half of the serum (as regulated by the nut on the syringe handle) was injected into the folds of connective tissue but never into the muscle, and then the rest of the serum was immediately injected into the first side considerably below where the virus had been injected, so the serum and virus would not mix. The serum would swell the skin out in a lump when injected. Very seldom would a pig jerk away during the injection; but in such a case there would be a great spatterment of serum over all those present, for the needle opens on the side. On small pigs the point of injection would be pinched to prevent serum running out. The dosage was varied each time according to weight. Always the wound was iodined; and at every fourth or fifth injection the needles were disinfected.

Of course there was an accompaniment of music; but the pigs did not seem to squeal or kick harder during the injection than at any other time. They were turned loose in another corral just over the fence to keep them separate.

To vaccinate a hog of 100 pounds, it was held about the same way but with its head on the ground and the extra man holding it. An easier way was suggested: lay such a hog in a sloping trough with a strip across to catch and hold it. Hogs too big to handle are corralled with movable panels and vaccinated behind the ears.

Hanging Block to Exercise Bull.

[Written for Pacific Rural Press.]

Exercise is a fundamental requirement of all kinds of breeding stock, as most practical breeders agree; but few dairymen put this knowledge into practice with their bulls, keeping them, instead, many times in small corrals from which they are seldom taken except to serve a cow.

Several years ago John Guill of Chico decided that his bull was not getting sufficient exercise, so he fastened a block of wood on the end of a strong chain and suspended it in the bull corral from the limb of a tree.

Careful watching failed to find the bull using this harmless plaything; but in time it was found that the wires joining chain and block were worn through from rubbing. Since

then heavy wire cables have been used to fasten block and chain, and even these have been worn out, although it is seldom that Mr. Bull can be caught near. It is a simple and safe way to give the bull the much-needed exercise, and Mr. Guill believes he is more vigorous and healthy as a result.

CUMBERLAND SHORTHORNS.

To the Editor: Are Cumberland Shorthorn cattle beef or milk type? —F. B., Emmett, Idaho.

[Answered by W. M. Carruthers, Mayfield.]

I presume your inquiry means the shorthorn bull, "Cumberland," which was used so successfully in the Charles Saunders herd at Manila, Iowa, for a number of years.

FOR SALE!

At a Bargain

One of the best and most productive ranches in the State of California is offered for sale. 87 Acres of rich sediment land, located north of Santa Clara, 1 mile from station, and 1 1/4 hours from San Francisco. The ranch is all level, but with sufficient slope for irrigation. It is fenced and cross-fenced, and divided into 8 fields, each supplied with water in concrete troughs.

The improvements consist of a good hard-finished house of 7 rooms, well built and substantial with modern plumbing and other conveniences. Large horse barn, good dairy barn, sheep, pig and poultry houses, cottage for help, yards, corrals, etc. All in perfect condition.

The water supply on the place is excellent; besides a flowing artesian well, which supplied all buildings and fields without pumping, the ranch borders on a stream of permanent running water, from which the whole place is irrigated. The price of this valuable property is only \$27,500. Terms of payment can be arranged. Tools and implements included.

This is one of the best and cheapest ranches in the State. Rigid investigation invited.

Wm. P. Wright

Extensive Bottle Feeding of Lambs.

It doesn't often happen that range sheep growers are willing to give lambs away at lambing time when they have already contracted with buyers to sell them at \$7 a head when ready for the market in July, but owing to the heavy percentage of twin lambs in most parts of the Sacramento Valley this year, the J. S. Gibson Co., large breeders of purebred Holsteins at Williams, Colusa county, were able to get 450 new-born lambs for the asking. Naturally these were the culls of the band, being mostly the poorer twin lambs from old and poor ewes that could not care for them properly.

Ordinarily such a gift would be a liability instead of an asset; but with plenty of good cow's milk to feed them, and ample space in old brooder and chicken houses to house them, they have been carried along with but small losses.

The way the lambs have been fed is striking; and to anyone who has tried to raise lambs on a bottle, the work of feeding 450 may seem almost impossible.

This has been greatly simplified on the Gibson ranch by the construction of a special lamb feeding device that can be moved. A V-shaped trough was made, with holes bored through one side about six inches apart. This was set on a substantial frame, about two and a half feet from the ground. A small stall for each opening was made with half-inch boards that extend forward from the trough to the ground in an inclined position.

This trough accommodates 16 half-quart beer bottles, which, when filled, are laid on their sides in the trough, with neck protruding through the hole. At feeding time, which is three times a day, a workman with cart, bottles, nipples, bucket, and milk tank makes the rounds of the various houses. The bucket is equipped with a faucet near the bottom for filling bottles which is accomplished in short order. As soon as the nipples have been fastened on and the bottles placed in the trough a pen of lambs are let out of their enclosure; quickly consuming their milk and then quietly going

back to their pen.

Whole cow's milk is fed in this manner till they are old enough to drink out of a trough, by which time they also eat sparingly of alfalfa or other roughage. Some trouble has been experienced with bloat; but except for that no difficulty has been encountered; and a neat profit is expected from the experiment.

HEIFERS LOSE FIRST CALVES.

To the Editor: My two-year heifers lose their calves six or eight weeks before time. They are fat and running with milk cows. Have fresh water every day; fed Indian corn and sorghum silage all winter with chopped alfalfa and foxtail hay. They get some green grass now but no silage. Have had seven or eight similar cases in the past three years and all carry their next calves the full time. One of the last heifers to lose her calf about six weeks ago is still discharging cream-colored matter and has never again come in heat.—R. A. L., Porterville.

Your trouble is contagious abortion. Employ a competent veterinarian to outline a course of treatment for your particular herd and to act in an advisory capacity as well as to apply the proper treatment to those animals needing same.

MILK TAINTED WITH BLOOD.

To the Editor: A cow freshened a month ago with a good flow of milk, but it is still tainted with blood, kind of pinkish under the cream.—F. O., Rio Vista.

Give this cow two drams potassium iodide in water twice a day for a period of one or two weeks.

H. P. Slocum and Son of Willows report the following sales from their recent importation of brood sows: Two to Geo. E. Spencer, bred to a grandson of Kings Col.; nine to Spalding Co. of Willows (six of which with one of the Slocum boars are to go to Honolulu); three to W. L. Smith, Willows; one granddaughter of Kings Col. to Mr. Layman, Maxwell; one to W. V. Bennett of Nord; one to Rev. C. R. Hedges and John McMartin, Glenn; one to W. H. Otterson, Glenn, and a Berkshire sow from Iowa to A. Pelko of Glenn.

SHORTHORN Sale and Show

by the

Northwest Shorthorn Association

86 head—52 bulls and 34 cows and heifers—of choice Shorthorns, from the best herds in the Pacific Northwest will be shown and sold.

TUESDAY

April 3rd, 1917

At the Portland Union
Stock Yards, Portland, Ore.

Opportunity for the bull buyer, and the man who wants to buy foundation females, that will prove a profitable investment.

See the show the day prior to sale. It affords opportunities for comparison of bulls and females that will be appreciated by buyers, and valuable lessons may be learned therefrom.

A sale under the same auspices will also be held at Spokane Union Stock Yards, Wash.,—consisting of 55 head of Shorthorns—on April 5, 1917. Plan to attend one or both sales.

Raising Poultry for Profit

HOW TO PREVENT POULTRY PARASITES.

[Written for Pacific Rural Press by Susan Swaingood, Pomona.]

Everybody knows that prevention is better than cure; and this holds good in the prevention of poultry parasites as it does in any other line of work. The idea that fowls must and will have a certain number of lice, or that you can't prevent mites from getting in your buildings is erroneous.

The large body lice that infest hens live on the skin and at the roots of the feathers. They are not blood-sucking animals; but when a hen has many of them, they annoy her and keep her scratching. The smaller kind of a sort of yellow animal that darts like a streak of lightning when you open up the feathers, these exist on the skin and feathers too, as also does the little red louse. All these varieties, however, have a common meeting ground—they all go to the vent to drink; also they all must breathe through their own skin. Now there are two ways of getting these animals and one good one to prevent them. But before you can prevent their growth you must first be sure you have rid the hens of them, and that is just what few people do. They dust a hen once and expect that to last, while the fact is if you kill every one the hen has on her she will have a new batch hatched out in ten days. Good insect powder, tobacco dust, or anything that will clog the pores of the skin on these pests are sure to destroy them, but it must be repeated at intervals of about six days for a full month. After that keep a good dusting ground for the hens and mix in the dust bath a little flowers of sulphur, good commercial insect powder, or tobacco dust and keep all dry.

Now to get them at the vent: a great deal of noise has been made about mercurial ointment; I have recommended it and have used it, but no more. Those who want to use it do so at their own risk. Mercury paralyzes the organism in some place. In breeding stock I tried it and found that it ruined the fertility, according to the strength of the ointment, and that in all cases the eggs hatched better from hens that were never anointed. To clear hens of lice by this method it is necessary to repeat it so as to get the nits as they hatch and then it must be repeated to prevent them from getting on the hens again. But here again we have a choice of ointments; an ointment made from red precipitate of lead, lard, and tallow, and applied in the same manner as the mercurial ointment is quite as effective and not so injurious.

For Little Chicks.—If mother hens, turkey hens, etc., are rubbed under the wings with a few drops of oil of cedar about once a week it will prevent head lice on the chicks, turkey poult, etc.; but mind, it must not be done just once and then let go at that, but once a week; and it is both cheap and easy to apply.

The Mite Question.—"Now we've got you," says somebody. "If you

can tell us how to prevent mites your fortune is made." I'm not so sure about that; I have been telling poultrymen lots of good things for years and I am neither rich nor famous. Mites get in a chicken house from different causes; many of them unavoidable for the average person. But there is one thing, or rather two things, absolutely necessary to produce mites in quantities. These things are warmth and moisture.

If your poultry house can be kept dry, with a circulation of air under it, and you spray the interior, say once a month with distillate and crude carbolic acid at the rate of one quart of acid to a gallon of distillate, you surely can prevent mites. But the spraying must be thorough and no nest boxes under the dropping boards; that is about the worst kind of advice that can be given, namely to economize space by putting nest boxes under dropping boards.

If your houses are not too heavy to lift or not fastened in any way to the ground, block them up at least one foot for summer and give free circulation, then rid your house of mites by spraying, and, believe me, your mite question is solved. Mites seldom bother in winter. Why? Because the air is not warm enough. These pests must have warmth and moisture and they breed fast when these conditions are supplied, perhaps if we had two-story buildings for summer, where the sun would dry out all moisture from the droppings, and everything clear of the ground, we would not have to do anything else to prevent mites.

Ticks come under the same class as mites. They are blood suckers and they hide in the buildings under the shingles, shakes, boards, or cracks and it takes awful good spraying to reach them. I have known where a place did not have any chickens for three years and the man built a new house, using just one old board that he took from an old blacksmith shop, and the ticks that were not visible to his eye when he nailed that board on killed two fine chickens for him the first night, and he had quite a time to save any of them. Now both mites and ticks breed in the ground as well as in the houses and both must have the same conditions—warmth and moisture. The only preventive, then, is to raise the houses and let in plenty of air to dry, and keep dry the ground where the houses are.

LOOK OUT FOR COLDS.

[Written for Pacific Rural Press by Susan Swaingood, Pomona.]

There are many complaints of colds, probably owing to the weather changes, and also because hens that have been laying all winter are a little depleted. But we must draw the line on depriving the hens of nourishment or they cannot hold up. The egg basket does not usually suffer first; it's the hen's health that breaks down at her weakest point. If she has had forbeas that had a weakness for taking cold, then it will affect a hen that is a little run down in that

way. If the forbeas were addicted to rheumatism, that will affect the hen that is run down. If you find your flock taking colds without apparent reason, build them up with better feed. The tendency towards feeding too much bulky feed is showing in these complaints; we must remember that hens are not cattle; they will do very well on less if they must, but not on poorer quality.

Dr. Prince T. Woods says, "We used to believe that drafts were dangerous to chickens. We believe now that poultry troubles are not so liable to be due to drafts as from other causes. We have kept healthy birds in good order in drafty quarters all through severe winter weather without bad results. We like a house that is really tight on three sides and open in front, because it is more comfortable. But we have, for three seasons, wintered in an open-front house that is single-walled and that has good-sized cracks between the boards in sides and back."

Dr. Woods might have gone further and said that the reason his poultry stood drafts was because he fed them to keep up their stamina.

All forms of poultry colds, roup, canker, etc., are contagious; and if one takes a cold today and is not removed, it is but a short time till there are many more cases, owing to the number of fowls that are in close quarters. Continued exposure to chilling winds may start colds much quicker than cracks or drafts, but after poultry have been so exposed, if they are given shelter and made comfortable, no ill effects will be noticed, if they are in good condition.

An almost sure cause for large flocks of poultry taking cold is to

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/4c per word.

EXTRA QUALITY White Leghorn chicks, 12c until March 1st, then 10c. Carefully line bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying and lose a dollar per pullet in raising; get the Best and Succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hoganized White Leghorns. Bigelow chicks are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. Shipped on approval; examination before paying. The Bigelow Poultry Ranch, Sonoma, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

leave them in a chilly wind for a few hours, then feed them a hot mash. After they have filled up on the mash they will crowd in corners and next day you will have a nice job on your hands. The best thing, to feed on cold days is good hard grain in clean litter and let the hens get up circulation by scratching for every kernel.

The best recipe for these colds is prevention. If you can't afford to feed all you have well, sell a part of them to do justice to the rest. Hens that are well fed will stand all sorts of weather changes and come out in fine condition, while poorly fed hens will take cold with every change and with the least draft or exposure. Many people bring on "colds" by throwing lime around promiscuously. The lime irritates the lining of both nostrils and throat, causing them to run and the hens are seized with sneezing and coughing. Dry lime has no place in the poultry house.

The cheapest and most efficient germ destroyer for poultry houses is crude oil, or some of its products. Spray and spray often if you want to kill and keep germs out. Pour a little coal oil on top of all drinking fountains when any of the flock have a cold. This cleans out and heals the nostrils. A little of it will go down the throat with each drink and act as a mild physic. This and good feeding will soon rout the colds.

COST OF PRODUCTION A FACTOR IN DISTRIBUTION.

To the Editor: My acquaintance with the Pacific Rural Press runs back over nearly thirty years, and I desire to comment on your editorial of February 24 touching the State Marketing Law, the State Market Director and his critics. As a producer who happens to be now an executive officer of a producers' marketing association, I want to thank you. Among our fellow-citizens, male and female, who champion loudly the cause of the oppressed consumer there seems to be prevalent a surprising indifference to the cost of production, united with a profound ignorance of the cost of distribution and its incidence.

The latter point is perhaps most clearly illustrated by the continual repetition of that much-overworked phrase—"Eliminate the middleman." So far as the writer can make out this means, in most cases at least, the wiping out of the jobber or wholesaler, who takes the product in bulk from the grower and delivers in suitable quantities to the retailer. Now the legitimate cost of this comparatively crude service (including the receiving and subdividing the product, delivering the same and carrying the account) is really a very small part of the cost of distribution. Under normal conditions the jobber is satisfied with a profit of 3 to 4 per cent on his turnover, and he relies on volume of business for a sufficient return on his investment.

Actually, by far the greater part of the cost of distribution is the expense of retailing, and this is a matter that lies absolutely within the control of the consumer. The expense of retailing has risen rapidly in recent years. Lines that formerly figured 20 per cent as the cost of

doing business now find it runs as high as 30 per cent, and it is constantly increasing. Why is this? Because the consumer demands and receives an increasingly elaborate and expensive service, which must be paid for.

It may be that this is inevitable. Possibly it is an accompaniment of modern civilization to which we must perforce be reconciled. But that is a question for the consumer to consider very seriously when he complains of the extent of the gap between what he pays and what the producer gets. And ladies who point an accusing finger at the "extortionate middleman" would do well to pause and consider how much of the admittedly excessive cost of distribution is due solely and directly to their own demands for an elaborate and costly retail service.

I spoke above of the legitimate cost of jobbing. It is unfortunately true that the jobber of food products has often by more or less questionable means secured an illegitimate profit which has come out of the pockets of either the producer or the consumer or both. It is equally true, human nature being what it is, that, speaking generally, he will continue these practices wherever opportunity is afforded. His reasons for doing so need not be gone into here—they are commonplace to every student of marketing conditions. Suffice it, that being usually a very decent chap and a good neighbor, like the rest of us, he justifies himself broadly on the ground of unsatisfactory market conditions and the consequent necessity of protecting himself and his business interests.

Now it is precisely these bad market conditions and the bad practices which arise from them that the California State Market Law, as interpreted by our State Market Director, aims at correcting. The approved method is organization of the producers. This results in standardizing of the product, does away with speculation and with waste in distribution and consequently tends to stabilize the market. The net result aimed at is better returns to the producer and better values to the consumer. The writer believes that no candid observer will deny that this method is producing just such results wherever it has had time for a fair trial.

Asst. Gen. Mgr. Poultry Producers of Central Cal.

POULTRY QUESTIONS.

[Answered by Susan Swaysgood.]

Comb Black.—I have a cockerel. The points of his comb turn purple, almost black at times, then for a few days it will be all right.—Mrs. J. B.

The trouble is most likely due to inactive liver, or from worms. Either of these will affect the comb in that way. If you have been feeding a great deal of mash, beef-scrap, etc., then it is from the liver, and the remedy is to stop the feed that causes the trouble. If it comes from the worms, give 20 drops of oil of turpentine through a medicine dropper, early in the morning, confining the bird; after one hour give a good physic, say half an ounce of castor oil, and turn him loose.

Too Thin.—I am feeding my poul-

try moist mash twice a day and yet they are going thin.—K. C.

A feed of moist mash lasts a chicken just about as long as a plate of soup lasts you, and if you are feeding the mash morning and night, as I infer from your letter, the chickens have no food in the craw for a number of hours at a time, hence they get thin. Feed them good hard grain of some kind once a day at least, and that at night, then they will have a little to sleep on.

MODISH FABRICS.

Dear Friends: Thinking you might be interested in the new spring fabrics this week I will tell you of them.

There is the washable satin-finished silk La Jerz, probably the most fashionable stuff for sports things. It comes in white and colors and is wide but expensive.

Tussah silk is sand-colored like pongee, but heavier and firmer. It is shown with pure colored rings and stripes as well as plain.

There are various so-called sports silks—pongee plain and figured, the figures being circles of combined colors looking like a little bouquet of flowers. Stripes of equal widths of bright color and plain pongee, and stripes in a cluster of narrow lines are shown at reasonable prices. Then there is a silk heavier than pongee and more rough in white or sand or bright colors, and even with the big circles of color like the Khaiki Kool material. This sells for \$2.75 a yard.

The Khaiki Kool is going to be even more popular than last summer. It is a heavy rough silk, wide but expensive. It comes in oyster white, grey, bright blue, yellow, pink and purple. Bags are made of this stuff—simple, gathered bags and pocket-books of a combination of colors. The material also is used for new collars—the bright spots or stripes cut out and appliqued or used as they come in the goods. Skirts and sports suits are fashionable made of this material and the small flat parasols even, and hats too, are fashioned from it. There are several other materials very similar to Khaiki Kool called Sea Breeze, Zephyr, etc.

In the wools there is the greatest assortment of weaves and colors. In serge there are plaids of grey, green and purple; blue, green and white; blue, tan and white; red, grey and white; green, yellow and blue. In stripes half is white, half color. The color is composed of combinations of grey, blue and yellow; blue and yellow; blue and green; grey and green; brown and yellow; purple and yellow; green and yellow. Skirts are made of such cloth by plaiting it white out, color hidden except where the plaits open. Heavier cloth also is shown in these new weaves and some skirts are really as heavy as winter clothes when made of this stuff.

Chiffon cloth is displayed with gay stripes or rings of color for blouses, or use on afternoon dresses.

There is a cotton tussah being shown in one shop that is a mercerized material. Shown in sport patterns it is advertised for sport suits. It has the advantage of being thin and quite inexpensive.

Cotton crepes are very fine this spring. The material is wide with a double border on one edge of a darker or contrasting shade for trimming purposes. In these, too, are stripes or plain colors. There are many new shades and interesting possibilities present themselves with this material.

The voiles as usual in the spring-time are shown, but this year they seem extra nice. There are stripes, of course, in dainty colors, and

ribbed and corded effects. There are also checks, and plaids. The flowered material and the elaborate border is shown, but is not as good style as the simpler effects. These voiles are made up in combination to advantage; that is, the upper part of the skirt white, the lower a plaid or stripe in color and the waist likewise. Soft organdie colors may be purchased all made up which help to finish a dress made at home in the correct style.

Scotch gingham too are displayed in lovely combinations of soft colors in plaids.

There are new cotton materials called sports suitings in a sort of a twill in white with brilliant colored figures like the silk sports stuff. The ever popular linen and rep, too, is shown.

Corduroy is still a favorite for separate skirts. It comes in white, sand, and colors and is washable—i. e., the good quality if washed with care stands the water and looks like new after every laundering.

This I hope will give you an idea of the spring materials.

Rosabella Best.

DRIED PEACH-RHUBARB CONSERVE.

One-half pound dried peaches, 2 lbs. rhubarb, 2 oranges, 7 cups sugar, 1 lemon, $\frac{1}{4}$ lb. blanched almond meats. Soak dried peaches all day, drain and put through food chopper. Peel rhubarb and cut in $\frac{1}{2}$ -inch pieces. Cut orange pulp in small pieces, grate rind of 1 and add juice of the lemon. Put layer of rhubarb in large bowl, then layer of dried peaches, then sugar, orange pulp and lemon. Repeat until you have used all your material. Let stand all night; next morning, boil about $\frac{3}{4}$ of an hour or until thick, adding the cropped almond meats 10 minutes before taking from stove. This should cook quickly so as to retain the yellow color. Fine on cold meats or fowl.

HOUSEHOLD HELPS.

A stick with a notch in the end is a wonderful help at house-cleaning time, to lift pictures from the walls. The wire slips into the notch and does away with the necessity of the step ladder.

To clean a very rusty stove wash well with vinegar, giving a second application if necessary. After thoroughly dry, polish with a dry polish.

A teaspoonful of lemon juice added to the water in which rice is to be cooked will whiten the kernels and improve the flavor of the rice.

Soak the cut-up rhubarb in soda water—1 teaspoonful soda to 1 quart of hot water—for a few moments before cooking and much less

sugar will be required to sweeten it.

Try baking a ham by covering it well with a paste made of flour and water rolled out in a thin sheet. Cook in a moderate oven six hours.

Brass andirons which need brightening up should be rubbed with a mixture of oil and rottenstone. Apply with a chamois cloth.

Meat and fowls may be made more tender if when cooking a teaspoonful of vinegar be added to the water.

White suede slippers may be cleaned with equal parts of powdered alum and fuller's earth. Apply to the slippers with a dry brush and rub until clean. For glace kid slippers use gasoline and apply with a flannel cloth.

Tortoise shell or ebony toilet articles with silver decorations require to be treated very carefully when the silver is cleaned, as ammonia and silver powder ruin the finish on shell and ebony. Small, blunt sticks, covered with chamois, should be used and this should be followed by a rubbing with dry chamois.

OILED PAPER.

There are many uses to which oiled paper may be put to good advantage. It has long been used for wrapping butter which is to be put on the market. If a small piece of oiled paper is put over the knife with which butter is to be cut a smooth cut will be made and the butter will not stick to either the knife or the paper. The appearance of articles when they are brought to market often does much toward selling them and there is nothing cleaner or neater than oiled paper for covering lard, cakes, candies and numerous other things in the edible line. In the household it also comes in handy for covering foods which are to be set away. When putting up lunches, if oiled paper is put between the different articles it will keep them from mussing or mixing together. One of the worst parts of carrying lunches is having the pie run all over the bread or the vinegar, from the pickles soaked into the cookies, but by wrapping up the pickles, putting in layers of paper and crumpling up small pieces of paper to fill the vacant spaces, the lunch is kept stationary and all articles are kept separate. When oiled paper is kept handy it becomes very convenient as well as useful.—E. R. F.

TO BRIGHTEN LINOLEUM.

Wash with skim milk and water. Once a month rub over with linseed oil, or if a linoleum polish is desired, prepare the following: Palm oil, 2 ounces; liquid paraffine, 18 ounces; kerosene, five ounces. Apply with a cloth when the floor is clean.

THE HOME CIRCLE

Good Health.

[By H. E. Pastor, M. D.]

Too Much Soap.

Soap is so closely associated with our efforts to remove dirt from our persons, from our clothing, and from our domestic surroundings that the word "soap" has come to be regarded as synonymous with cleanliness. And yet the use of soap may easily be overdone, and is, to a certain extent by people who consider its cleansing effects only, without taking into account the harsh action of the alkaline content of soap when applied to the human skin. A writer in a late number of the Literary Digest, quoting from the Liverpool Medical and Chirurgical Journal relative to the abuse of soap, says: "The secretion of the skin is sluggish, and the excessive removal of the natural grease leaves the skin rough and branny. * * * Pruritus (itching) is not infrequently brought about by a too zealous use of soap. The delicate skin of new-born babes is sometimes irritated by the zeal of the nurse in rubbing not wisely, but too well, with soap and water. * * * It is notorious that frictional eczemas are invariably aggravated by soap and water."

We know several ladies with delicate and enviable complexions who are almost as much afraid of soap touching their faces as they would be of oil of vitriol. For the removal of the inevitable deposit of dirt they prefer the use of a good cold cream applied with the fingertips and wiped off with a soft cloth. However, most of us can't be as dainty and dilatory as My Lady, and we have to employ the rough-and-ready method of scrubbing our mugs with plain soap and water. It is just as well, nevertheless, to be not too lavish with soaps on our face and hands, especially in the arid atmosphere of California, if we have any regard for our personal appearance, and to buy only the best quality for this purpose. There's such a thing as being conservative about cleanliness even.

The Poor We Have Always with Us, Likewise the Crotchety.

The anti-vaccination hallucination has seized upon some member or members of our State Legislature and several bills designed to discredit the well-established efficacy of vaccination have been introduced. One of them would force our public schools to admit the unvaccinated children of ignorant, careless, or fanatical parents, and thus expose other innocent children to the possible (and probable) contagion of smallpox; and another would open the doors of the University of California to the same class of undesirables. In this connection it is edifying to read this paragraph in the report of the State Board of Health for January (p. 154):

"Smallpox increased considerably during January. There were forty cases reported during the month, as against ten cases reported during December. Fourteen of these cases occurred in San Francisco, seven in Solano County, six in Alameda County, and the rest were scattered throughout seven counties of the State. Twenty-seven of the total

The night has a thousand eyes,
And the day but one;
Yet the light of a whole world dies
With the dying sun.

The mind has a thousand eyes,
And the heart but one;
Yet the light of a whole life dies
When love is done.

—Francis Wm. Bourdillon.

number had never been successfully vaccinated, five had been vaccinated more than seven years preceding attack, and vaccination histories were unobtainable for the remaining eight cases."

In other words, among all the cases of smallpox reported for the month, there was not one where the patient had been vaccinated within seven years, so far as could be ascertained from information available.

Out-of-Town Patrons, Take Advantage of Barker Bros.' Unrivalled

Mail Order Service

You don't have to come to this great store in person for what you need—we will send our store to your very door through our Mail Order Dept. We maintain a Personal Service Shopping Bureau for your benefit, so that every order is given the same attention by our expert shoppers who buy for you, as though they were buying for themselves.

Write us for what you want in furniture and home furnishings. Our stock in every household line is wonderfully complete and varied. Our values are unusually attractive. Just address our MAIL ORDER DEPARTMENT.

[By Geo. N. Tyler.]

Keep Rose Bushes Clean.

Owing to the extremely cold and frosty weather, and rain, there is very little that can be done in the garden. Roses are now making breaks and are very subject to mildew, which is caused by sudden changes of temperature, but is easily controlled if taken in time. One tablespoonful of permanganate of potash to two gallons of water is said to be a sure cure and preventive. Potassium sulphide is also good for both mildew and aphids. Dry sulphur dusted on the plants while they are wet with dew in the early morning is another remedy; but the one I like the best is the lime-sulphur spray. Put twenty-five pounds of lime in a fifty-gallon barrel, and while it is slacking add ten pounds of sulphur flour. Keep stirring and adding more water till it is all cooked up, then fill the barrel up with water and stir thoroughly. When the lime-water is settled there is a golden liquid. Use one part of this liquid to one part water and spray foliage and surface of soil with this mixture. It will destroy mildew, and the future growth will be clean. This liquid will keep indefinitely, and when emptied can be filled several times, but do not dilute with water after second filling; use it clear. Aphids will soon be at work. These can be washed off with a strong spray of water or you can use tobacco extract, or nicotine. Two teaspoonfuls to a gallon of water, with a small piece of soap dissolved in the water to make it stick on the leaves. Coal oil emulsion is also good, or make a very soapy water, which will also get them. Whale oil soap is also good. There is no excuse for aphids, either in greenhouse or garden.

Hothouse Hints.

Small greenhouses should have a light shading now, as the young new growth of tender plants burns very easily. Make a mixture of white lead and gasoline, or distillate, and spray or paint the glass from the outside. This is easily removed in the fall, while whitewash has to be scraped off. Whiting in water is also good, but this washes off very easily and will have to be renewed after a rain. In small greenhouse it is advisable to have some material to stand the pots on so they will not dry out so quickly. Some use sand or gravel, or pulverized oyster shells, or cinders, and then again some use the common garden soil. These are all good if you can obtain nothing better, but all of them will sour and form a green mould on top, which gives off a stagnant moisture which is injurious to the plants. What I have found to be the best material is charcoal dust, and one sack is enough for a house ten by fourteen feet. I will tell you why it is better than any other material. Charcoal is a purifier, and it is an utter impossibility for water or air to sour or become filled with stagnant moisture where it is used, and it absorbs more moisture than any other material and gives it off as the plants require it. Keep the paths and absorbent surfaces well sprayed while the plants are making growth, with very little ventilation—

more air can be given later. Take a dishpan half-full of water, to which has been added a tablespoonful of ammonia; heat two bricks red hot, close up the house and put the bricks in the pan of water, and you will give your plants a steam bath that will greatly benefit them.

TO MAKE DUSTERS.

Add 1 ounce paraffine oil and 1 ounce of kerosene to 2 pints of benzine and add a few drops of oil of eucalyptus. Dip clean cloths in this solution and wring out. Hang out in the air to dry until the benzine evaporates.

Wheat cereal, oatmeal, farina, mush, etc., are delicious if dates or figs are stirred into them before serving. Cereals will be relished if dried fruit is added to make them more attractive and palatable.—Extension Service, State College of Washington.

It is claimed that 15,000 maternal deaths occur annually in the United States through preventable causes.

The greatest "safety first" device is watchful eyes.

Europe's many tongues and consequent misunderstandings

The Fruits of Understanding

Throughout the vast area of this country prevails a common tongue. The whole of Europe hardly exceeds our territory, yet Europe has more than a score of nationalities and many different languages.

In the United States the telephone, as exemplified by Bell System, renders a matchless service in its mastery of distance and in encouraging the use of a universal language. This accomplishment is in spite of the great influx of population from every country in the world.

In Europe the independent countries, separated by barriers of language, and lacking efficient

telephone service, suffer from inadequate facilities for intercommunication.

We now talk from the Atlantic Coast to the Pacific, and eliminate more than three thousand miles. In Europe, contending with a babel of voices and unrelated telephone systems, a bare quarter of that distance has been bridged with difficulty.

The ideal of the Bell System has been day by day to extend its service in the interest of all telephone users. Its efforts have resulted in providing the facilities to unite cities and rural districts in true American democracy.

Egyptian 2.35@2.40

BEANS.

Trading in beans has been rather slow during the past week, the market apparently not having recovered from the quietness which followed the announcement of the possible strike last week. Local dealers are at a loss to explain this state of affairs, as they had expected a good Eastern call to follow the news that there would be no strike. All this has tended to leave prices at about the same level as was reported last week, the only two changes being a small advance on southern limas and a decline on southern small whites.

[Recleaned, f. o. b. San Francisco.]

Bayos, per ctl. 8.25@8.50

Mexican Reds 7.75@8.00
Tepary beans 8.50@8.75
Garbanzos 4.25@4.50

Heavier receipts at San Francisco failed to bring any halt in the upward march of hay prices, as the outside call more than kept pace with the increased shipments. Receipts here were 1489 tons, as compared with 1045 tons for the preceding week. While consumers are making every effort to economize in their feed bills conditions are such that many are forced to buy here regularly. This week saw Modoc and Shasta county cattle owners buying freely here. While the rainfall in these sections has been fair, the green feed supply is far from ready and these heavy purchases were necessary to save the lives of their cattle. Nearly all of the available hay now held in the rural sections is in warehouses that are not reached by water transportation and it was this condition that led to the fear that a strike would work considerable damage in this State. Alfalfa hay is in very good call and almost forgotten stacks are being dug up to fill current needs. The export demand has been about normal.

[Price per ton, carlots, San Francisco.]

INCREASED ACREAGE OF CANNERY TOMATOES.

Tomato growing for canneries will make good money from a very much larger acreage this year than ever before. It is reported that the larger canneries have already contracted practically up to full capacity at \$8 to \$10 per ton to the growers. New canneries are projected largely for tomatoes, and small canneries are making additions to take care of a larger amount in many parts of the State. Many are wanting tomatoes for the first time. Canners are offering \$9 and \$10 at Sebastopol and furnish seed. The Lindsay Olive Cannery is seeking tomato acreage in the Porterville district. Similar reaching out is encouraging increased acreage all over the State. Eastern and Middle Western growers are not contracting so heavily as usual; though packers are out for increased acreage at high prices. The growers want prices that will reimburse them for possible losses due to labor shortage. Delaware growers are asking \$15 to \$18 per ton.

Seed, at least in California, has become scarce and high-priced. Many tomato plants have been damaged by frost, limiting the possible acreage and reducing the available cannery supply.

Hens, extra, per lb., colored 24@25 c

BUTTER.

Butter prices during the past week have shown a steadily upward tendency in the face of increased arrivals with a good shipping demand the cause. Buying for Seattle houses has been heavy, it being understood that the bulk of these goods are to go on to Alaska. San Diego has also been a purchaser here and two large orders for Hawaii were filled. Prospects for a steady market are bright, despite the fact that prices now are nearly seven cents per pound higher than for the same dates last year.

WHEAT SCARCE AND FLOUR RISING.

The wheat crop for the current year was reported to be 640,000,000 bushels as against a five-year average of 728,000,000 bushels. Our normal domestic needs of wheat for human food, for seeding purposes, and for a reserve to carry over into the next year require 640,000,000 bushels. Including the holdover, the total year's supply is 804,000,000 bushels. This would give us an available, exportable surplus of 164,000,000 bushels, according to Secretary of Agriculture D. F. Huston. The planting last fall was 5,260,000 acres more than was harvested last summer. The average acreage of spring wheat for five years is 18,800,000. Added to the winter wheat, this would make a total of 59,000,000 acres. The average crop for five years has been 15.5 bushels. This would give us 914,000,000 bushels if worse weather does not interfere. This will give us 274,000,000 bushels to export from the coming crop. And yet flour is rising by jumps.

LOS ANGELES.

Los Angeles, March 20, 1917.

BUTTER.

Receipts of week ending Mar. 20, 1917
360,995.
Receipts of week ending Mar. 20, 1916
337,520.

There was nothing new in this market the past week. The threatened railroad strike caused receivers to hold and confine themselves to supplying the consuming trade. The arrivals were somewhat better than the week before, but with a good home demand and the absence of stocks, last week's prices were maintained, extra remaining at 33c up to Monday and San Francisco at 34 1/2c. Chicago, as the week before, was a 40c market for extras while New York firmed up a little, extras there on Monday being 41 1/2@42c. With the railroad strike now off and increased production with the coming of warmer weather, a weaker market is looked for. Still values are ruling 5c higher than this time last year. Tuesday brought no change either east or west. On call there were no bids or offerings. Receipts were liberal but they failed to influence the market.

EGGS.

Receipts (railroads) for week ending Mar. 20, 1917—3071 cases.
Receipts (railroads) for week ending Mar. 30, 1916—4604 cases.

There was less life to the market the past week, though a fairly good movement was had. The receipts were a little better than the week before, though not so large as the same week last year. Hence a firmer tone to the market. While the consuming trade took most of the receipts, still there was some buying for cold storage. Besides the receipts of 3071 fresh eggs there were in during the week 2000 cases of Petaluma eggs and this had a tendency to weaken the market towards the close of our review week. Still prices are much better than this time last year and a ready demand had for all arrivals. San Francisco was a 26 1/2c market throughout and Chicago unchanged from a week ago, while New York was a shade higher. Tuesday the market showed a little more strength. On call extra and pullets advanced 1/4c, while case count remained unchanged. Demand fairly good at the prices.

Daily quotations:
1917—Wed. Thu. Fri. Sat. Mon. Tu.
Extra 25 26 1/2 26 1/2 28 27 28

Pullets 23 24 24 25 25 25 1/2
1916 19 19 1/2 19 18 1/2 19

POULTRY.

The market holds up well. The receipts were somewhat better the past week, the high prices of feed and good prices being paid for all kinds of poultry tempting raisers to reduce their flocks. No Eastern poultry coming in and demand good at quotations for young stuff and roasters. Hens, turkeys and ducks also moving without trouble.

We quote from growers:
Broilers, 1 1/2 to 2 lbs. 32@33c
Fryers, 2 1/2 to 3 lbs. 28c
Hens over 4 lbs. 22@23c
Hens, under 4 lbs. 21@22c
Ducks 32@33c
Geese 18@19c
Roosters, 3 lbs. up (soft bones) 26c
Turkeys, heavy, 12 lbs. and up 29@30c
Turkeys, light 24@25c
Squabs, live, per doz. 1.50@3.00
Dressed 3.75@4.85

ASPARAGUS.

The asparagus season has fairly opened. Daily receipts are being had both from the Imperial Valley and Grand Island. Demand fair, but prices are gradually getting lower every day with increased arrivals. Imperial Valley is selling at 15@25c per pound and Grand Island 20@30c per pound.

BEANS.

The high prices caused buyers the past week to hold back and do little. The light stocks, and this being seedling time, caused holders to maintain prices at present quotations. The consuming trade, however, is taking but few beans at present high prices.

We quote from growers:
Limas 13.00@13.50
Large white 12.00@12.50
Small white 12.00@12.50
Pinks 9.00@9.50
Blackeyes 7.50@8.00
Tepary 5.75@6.25

CABBAGE AND CAULIFLOWER.

There was a better tone to this market the past week. Receipts were light and all good cabbage was in demand. Most arrivals were poor and they were slow of sale. Shippers only want good firm heads, for which they are offering full last week's prices—\$2.50@3.00 per cwt. Cauliflower was in light supply and that coming in mostly poor. Choice large was in fair demand, but small and poor was very draggy and market for it was both dull and weak. Prices much the same as the week before—\$1.20@1.70 per standard crate. Season pretty near over.

HAY.

While there are no changes to note in quotations since our last review, the market has been very slow. Receipts were light, yet ample for the demand. Horse hay was in most request, the dairy people feeding more

WELL-STORED FRUIT GOOD SECURITY.

"To the Editor: Replying to your question, I know of no better security than fruit stored in a fire-proof warehouse and insured. The bank which I represent realizes that the average fruit grower is worthy of credit, and we shall treat them as liberally as possible, always bearing in mind that our bank is enterprising yet conservative.—T. S. Montgomery, President, Cal. Prune and Apricot Growers, Inc.

or less green alfalfa, thus reducing the demand from the dairy people. We quote f. o. b. Los Angeles: Barley hay, ton\$20.00@22.00

Los Angeles, March 20, 1917.

CATTLE: The past week brought no change in this market. The receipts were not heavy, though equal to the demand. California and Arizona furnished most of the supply and gave us some very good cattle. Holders, however, are not pressing their cattle upon the market, the continued high prices East making them rather independent. Killers all in the market and wanted supplies though were not disposed to buy ahead.

Per cwt. f. o. b. Los Angeles: Beef steers, 1000 to 1100 lbs. \$9.00@9.50 Prime cows and heifers 7.50@8.00

Special Citrus Market Report.

Los Angeles, March 20, 1917.

Shipments of citrus fruits from Southern California from November 1 to March 18: Oranges 12,386 cars and lemons 2,307 cars. Shipments the same time last year: Oranges 9,839 cars and lemons 2,042 cars.

Shipments from Central California from November 1 to March 17: Oranges 4,045 cars and lemons 162 cars. Same time last year: Oranges 4,195 cars and lemons 142 cars.

There was a marked improvement in the Eastern orange market the past week, brought about by the threatened railroad strike and temporary embargo put on shipments by the railroads. All the Eastern markets showed an advance and demand fine for good oranges, especially those of medium sizes. Lemons were also stronger in sympathy and under the same influences.

Locally the market remains much the same as a week ago. There was a little better movement in highly colored oranges of medium sizes and large size grapefruits. Packers while buying a little more freely, paid no better prices, as fully half of the crop

is said to be still on the trees. Local packers paying 1@1½c per pound for oranges in the grove picked. Lemons continue as dull as ever, packers paying 1@1½c per pound in the grove picked for the best of them. All others have to be sold for what they will bring. Grapefruit 1½@2c per pound in the grove picked. Tangerines hard to move at 1@1½c per pound in the grove picked.

AUCTION SALES.

New York, March 19.—Thirty-one cars navel, five cars mixed and three cars lemons sold. Market strong on navel. Higher on lemons. Weather fair. California navel averaged \$2.75 @4.05. Lemons averaged \$3.40@3.90.

Boston, March 19.—Eighteen cars sold. Market doing better on small size oranges. Unchanged on lemons. California navel \$2.90@3.90. Lemons averaged \$3.10@3.65.

Philadelphia, March 19.—Sixteen cars sold. Market lower on oranges. Firm on lemons. California navel averaged \$2.45@3.60. Lemons averaged \$3.50@3.75.

Publisher's Department.

A total of 243 new paid subscribers were added to our list during the past week. These new readers were all secured without the use of premiums or clubbing offers.

A new book from the Macmillan Co., of 66 Fifth Ave., New York, was received during the week. The book is entitled "Breeding of Farm Animals," and its author is F. B. Mumford, Dean of the College of Agriculture of Missouri. It covers the subject of breeding very completely, contains over 300 pages, is cloth bound and illustrated. Price \$1.75 net.

F. O. Pope of the Lawrence-Williams Co., publishers of the Ohio Farmer and owner of Gombault's Caustic Balsam, was a caller this week, while on his way home from a two-months visit in California. We are always glad to see Mr. Pope, as he comes in with a breezy, happy laugh, a hearty handshake and a large view of things in general which makes for contentment.

Every indication points to a demand very much in excess of the possible supply of automobiles this year. We are prepared.

This year we apply the economies of vast production for the first time to a *complete* line of automobiles—an end toward which we have been working for eight years.

Light Fours, Big Fours, Light Sixes and Willys-Knights, including the marvelous Willys-Knight Eight, are built and sold with

—one executive organization,
—one factory management,
—one purchasing department,
—one sales force,
—one group of dealers.

There is now an Overland or

a Willys-Knight for every class of buyer.

Every one of these beautiful cars is a better car—better in appearance, in performance and in riding comfort. One of them is the car of your dream under the evening lamp.

See these cars now. Get a car yourself this spring.

Catalogue on request. Please address Dept. 931.

Intercropping Young Deciduous Orchards.

[Written for Pacific Rural Press.]

BARLEY uses about 540 pounds of water for every pound of dry matter it adds to the plant. Potatoes and sugar beets use about 450 pounds. Alfalfa uses over 1,000 pounds and sweet clover over 700 pounds. The average of eleven field crops is 587 pounds of water under western conditions per pound of dry matter produced.

If, in your orchard, you interplant a crop that produces a ton of dry matter per acre, you must provide, at the above average, 1,174,000 pounds of water more than the trees need.

If you are not willing to do this, your trees will suffer and you had better have chosen to raise vegetables or hay.

To reduce the water requirement, choose intercrops that produce the least dry matter per acre, with the highest value. Alfalfa is not one of these, for it not only produces about the most dry matter, but it requires about the most water per pound of dry matter. Yet alfalfa has proved a most desirable crop in orchards where plenty of water is used.

Strawberries require about the least dry matter per dollar's worth of product, and are very commonly grown in young orchards.

Advantages of Intercrops.—

Every orchard planter wants to grow something between the trees to pay for the use of the land until the trees shade the ground too much. But there is another reason equally good. The common system of dry summer cultivated dust mulch keeps the roots out of the surface dirt where most of the plant food naturally exists. That plant food, too, is made more unavailable by the burning out of humus, due to summer sun on unshaded ground. Intercrops aid greatly in shading the ground, though they quadruple the water evaporated.

Dangers.—We have seen a few orchards ruined by growing summer intercrops and have seen many that were set back probably more than the value of the crops. Too often the available irrigation is not enough for trees and the intercrops. When the latter get first chance at the water, it does not reach the trees. Not always do the trees show distress. If their supply is consistently short from the beginning, they are likely to put out just enough growth to use it and no more. If you are after fruit you are delaying the game.

Ignorance of the depth to which irrigation water goes is a most common fault of farmers, who turn it into one furrow until it is full, then into the next, never dreaming that they are leaving most of it right handy to the surface for evaporation and are not wetting deep enough for tree roots to go after the stores of food in the subsoil.

Valuable dirt is thus wasted, and the tree roots are trained to grow at relatively shallow depths where occasional lack of irrigation will hurt them much worse than if deeper. Every man should find out how deep his irrigations go at various parts both of the furrows and of the place.

Non-irrigated Intercrops.—There are about three permissible conditions for non-irrigated intercrops: on well subirrigated land which is

likely not good for trees anyway; on deep retentive soil where there is heavy winter rain well stored in the ground; and where there is good rainfall, and winter crops only are grown. One or more of these conditions obtain in the Bay district of Alameda county where some of the most intensive winter intercropping of orchards is practiced. These crops include spring-harvested rhubarb, currants, and all sorts of early vegetables. The legume vegetable vines are turned under as a cheap but very fine fertilizer.

Irrigated Intercrops include almost anything, nursery trees, bush berries, vegetables, grain, corn, beans, potatoes, alfalfa, etc. Aside from plenty of water, these crops must have plenty of food and sunshine. Indeed, it has been shown that the addition of fertilizers and humus to

poor soils may reduce the water requirement one-half or even two-thirds. At any rate the trees must not be allowed to get stunted for life because intercrops rob them.

On account of the shade in older orchards, shade-enduring crops must be used or only a row or two planted in each center, as corn is often grown after the first few years. Strawberries which begin ripening in April are doing well for H. Harris of Kern county among apricot and peach trees about four years old and 20 feet apart. Five to eight flat-bedded rows in each center totaling 54 rows, each about 65 steps long, produced over \$300 worth of Klondikes last year for him. In Placer and Santa Cruz counties, a large acreage of young hillside orchards produce strawberries for several years. In the Van Nuys district of Los Angeles county, L. M. Hartwick had 10 rows of Nikoma and Banner strawberries per center among walnut trees up to six inches in diameter and 50 feet apart. These also were in wide flat rows with furrows between and about 40 inches from center to center.

Sweet potatoes seem well adapted for intercrops, Mr. Hartwick having raised a ton of them in two or three centers. O. Hilbers of Orange county was successful in growing four rows in each 24-foot center between orange trees. C. J. Oswald of Kern county produced 248 sacks of salable sweet potatoes from less than an acre of young trees 24 feet apart. But three rows four feet apart of cantaloupes per tree row on seven

acres made very poor vines, probably partly due to shade. In the first two years of H. S. Reed's apricot orchard in Imperial Valley, he took off 228 crates of cantaloupes per acre, and followed them with onions for a winter crop. Watermelons among young apricots yielded 12 tons per acre for E. Steiner of the same county.

Potatoes among five acres of citrus trees produced two good crops for G. C. Smith of Los Angeles county, who finished digging late in February. In his district were grown 60 acres of winter tomatoes also. His own four acres of tomatoes were planted Oct. 1, two rows six feet apart per tree row. Cabbage and cauliflower make especially good intercrops for winter growing. Beans are good where they will not make

(Continued on page 391.)

Strawberries among full-bearing Peach Trees in Glenn County. Hedge-like appearance due to tall young walnut trees planted between peaches.

ACRE-PRODUCT CURE FOR HIGH COST.

A VERY ingenious counter-attack is being made in the interest of food distributors who are anxious to divert public attention from the fact that they have been getting more than their proper share of the consumer's dollar. It is now being claimed that the high cost of food is not due to extortion and speculation after the farmers' product is captured, but is wholly attributable to the farmers' laziness in not getting a greater acre-product of his crops. It is, of course, a very silly contention from all reasonable points of view. It is a general and historic fact that, as trade is now constituted, the buyer pays the grower less per pound the greater his product is, and will continue to do so as long as he can—sometimes with good reason, but generally with the requisite amount of bad bunk, on his part. The cure for this is price-fixing by associated producers, in accordance with better statistics than have ever yet been attained, of actual supply and prospective demand when the crop is ready to move. Until this cure is reached it may do to claim that if the farmer would increase his acre product, the farmer would get less, the consumer would pay less and the distributor would get just the same—except that it does not work out that way very often. The usual result is that the farmer gets less, the consumer pays just the same, and the distributor gets more, when the supply is increased. Of course, as high patriotic and humanitarian lumps arise in his throat, the dealer forgets this and we find him, honestly perhaps, declaring that the real cure for the high cost of living is for the farmer to get more stuff from his land, and so we hear him shouting: "The American farmer gets from 13 to 17 bushels of wheat from an acre; the European farmer gets from 24 to 30 bushels per acre; therefore the reason why we do not have enough flour is because the lazy fool American farmer is so shiftless. It is all nonsense to arraign trade, transportation and other distribution agencies. The guilt is all with the farmer, who grows too little and the consumer who wastes too much."

MORE CROP, MORE COST.

THE foregoing declaration of the middleman is a procession of half-truths, and therefore very deceptive and misleading, but, like a run of grace-notes in music, it is calculated to tickle the popular ear, and therefore should be somewhat critically considered as to its content of real truth. It is, of course, true that the acre-yield of grain crops of this country can be increased 25 per cent and possibly even 50 per cent or more, if everything that is necessary to such increase is done, but it cannot be easily done, and it cannot always be profitably done. In fact, if no arrangement is made by which produce can be surely sold at a percentage above cost of production, as manufactures are, there is no surety that it can be profitably done. For it must be understood that more crop means more outlay of every kind by the grower—unless he happens to be able to move upon new land of stored-up fertility, and

all other natural conditions happen to favor him during the year that he makes the move. To convey the idea that the farmer can just as easily and cheaply get a large crop as he does a small one, by simply working harder and longer, as the middleman above evidently intends to assert, is a falsehood well calculated to deceive anyone who is as ignorant as the propounder thereof. Every effort to get a larger yield per acre, whether it be by better seed, by more and better tillage, or by increasing the fertility of the soil, or even the fuller knowledge to do these things, requires fundamentally more outlay, either in cash or labor, or both. This added cost has, of course, to be deducted from the selling value of the increment of crop, and it is sad to acknowledge that the required investment for crop increase is not always sure to be covered by the value of that increment. It is, of course, surer to be less than the required investment in Europe than in this country because of two fixed conditions abroad, viz.: the cost of labor is much less than in America, and the selling price of the product is much greater. The European agricultural laborer has the requirements and contents of a peasant; the American agricultural laborer has the ambitions and outlook of a sovereign—for even when he falls to dissipation, he drinks like a lord. His employer has to pay his high cost of living, either in wages or loss of efficiency or both. As increased crop requires increased labor, these are conditions which the American farmer has to take into his calculation. When it comes to selling, the American farmer has to move his expensive increment half-way around the world to get the price which the European producer gets at his nearest market town. There is such an advantage in cheaper production and higher selling price that it is little wonder that the American producer has been striving so long to cheapen production by machinery of greater capacity and by investing as little as possible in materials and supplies which would make for larger acre-yield—for the simple reason that a small yield at least cost gives him a better show for netting something than would a larger yield at a greater cost to get it.

IS THAT THE WAY TO DO FARMING?

IT IS not—and yet, as things have been, it has been about the only way to hold the land, unless one could find lines of production which yielded greater selling values, which many fortunately have found in more intensive industry with both plants and animals. But we are not following that line now, for our commercial orator, quoted above, rests his case on grain yield per acre, and we would not divert him. Is it then possible to bring the average American acre-yield of grain up to the European acre-yield which he cites, and what is it necessary to do to make it profitable?

First, it is necessary to have capital available for investment in land betterment and equipment at interest rates like those the European land-owner has to pay for the capital which he puts into his betterments of all kinds. Fortunately we are going that way now, but it is too soon to point to the effects of it. Hitherto the man who had land and no money could not possibly borrow money cheaply enough to invest for increased yields, no matter how well he knew how to do it. He had to borrow to get what the land would give with least outlay, and too often he missed the greater net which this least investment ought to have given him, because he had to pay so much for the little money he did borrow. Hitherto the man who had land and money to loan could not summon moral courage enough to put it in the betterment of his land because he could get so much more by the interest from lending it to others—even if they broke themselves by borrowing it. Thus the reduction in rural interest rates will work toward larger acre-yield—because a man who has land and no capital can borrow it for betterments, and because the man who has both land and capital will use the capital to improve his land for the chance of making more by producing than by lending.

The progress which has been made during the last few years in the popular understanding of the relations of reduced interest rates on capital

for agricultural uses, is really surprising. We do not need longer to go to farmers and build up an idea of such relations from their losses and hardships, as we did a few years ago. Financiers now acknowledge these relations so frankly and emphasize them so cordially that one is almost tempted to conclude that they have, always known and have always been at the point of tears over the evil of customs they were powerless to break away from. However, they have now broken away and have a right to laugh with joy at the suddenness and completion of their conversion. The Berkeley Land Bank, under government auspices, which was organized on Tuesday of this week, will soon be handing over to borrowers, through their local Loan Associations, several million dollars at 5 per cent, and will find itself in quite sharp competition with private capitalists, who have experienced enlargement of heart and shortening of fingers since the agitation of this subject began.

HOW DOES CHEAP MONEY AFFECT ACRE-YIELD?

OUR second point is that financing farming reasonably opens the way to everything which underlies increase of the acre-yield and so brightens the prospect of doing it profitably that the disposition to invest in farm improvement, which is necessary to increased production, will prevail among all who have agricultural vision and strength of purpose. One can not estimate the amount of money that will be invested in improvements and expended for equipment by farmers who have confidence and purchasing power. Water off land by drainage, water on land by irrigation; the use of fertilizers beyond anything ever done in the older States or dreamed of in the newer States; the scrapping of old implements which waste more time than they do work and the purchase of new implements and machines which make old Father Time himself do work by their greater efficiency: more power on the farm through motors which draw their energy from the clouds or from the center of the earth; more intelligence on the farm through better endowment of the government institution for research and instruction and through sufficient expenditure for good books and journals which teach the combination of science and practice and give the farmer the worth of his money in trustworthy truth about the best farming methods, instead of trying to wheedle him with clap-trap because it is cheap—and leave him holding the sack while they pursue other schemes for money-making. All these agencies for better farming through knowing more and through making better soils, plants, animals, fertilizers, implements and machinery, all work with him and for him, and through the application of fuller knowledge and better agencies to make the labor which he gives or hires more efficient in getting results—all these things will work together to increase the average acre-yield in this country, and to constitute American farmers more upstanding, and influential in securing industrial rights for themselves and for those who depend upon them for the bread of life.

WILL THIS INSURE MORE FOOD?

YES, because it will first make better farmers who will have the power to make better crops and to protect them from imposition by the throng which produces nothing, but aims to live by its wits in turning over what others have produced. Three things are fundamental to permanent increase of the average acre-yield in this country: (1) to know well; (2) to work to advantage; (3) to sell well. The last half-century of natural science, through the last quarter of a century of research for its best application, places American farmers in possession of technical knowledge which the world concedes to be the best of its kind. The last decade of study and effort for fairness in economics and finance is now bringing the American farmer into possession of industrial advantage which he has never possessed before. The third and the indispensable step toward making a lasting increase in food-production, the American farmer is now confront-

ing. Will he rise to it? Unless he can sell well—that is fairly, with regard to his rights as a producer—he cannot use the other two advantages which he has already achieved for himself. If he continues to allow others to price his goods, to him at four parts of a dollar, and to the ultimate consumer in such a way that six parts of a dollar are appropriated by others between the two, there will be no increase in the acre-yield, because it is economically impossible that there should be. He cannot profitably make the effort and investment which the increased acre-yield requires. He may

know how; he may have capital now at a parity with what is paid for other producing uses of money, but he does not know what he will get for his product; and, worse than that, he does not now know, as a rule, what he should get! He does not even have the last chance which the unknowing producer in other lines enjoys—the auction room. Of course, the farmer has the power to do everything our commercial orator, quoted in the first paragraph of this writing, declares and more. He can do it and make it profitable too, and if he doesn't do both he will do neither.

Cow Crops in a Moist District.

To the Editor: What about oat hay for dairy cows? We can't raise alfalfa in our valley. Clover does fairly well here for one or two years, then it is gone, but oat hay does finely. We get big crops of it, also of turnips and carrots and some years we get a good crop of corn, wheat or barley. The bugs take the pea and vetch. What is the value of grain hay compared with the grass hay, and what to feed with it to make a balanced ration? What is the value of turnips and carrots for dairy cows? It is very wet here in winter and in summer, too. From March until June cows do finely on grass. We do not feed at all.—Subscriber, Smith River, Del Norte county.

Oat hay is the most tender and nutritious of grain hays and is better than coarse grass hays, and it free from rust and cut at the right time will compare well with any grass hay. It comes nearer to a balanced ration, because of its good protein content, than most dry forage or roughage does. It needs, however, to be fed with silage or roots to get the succulence which maintains the milk flow. Beets and carrots are especially good for such use with oat hay. Turnips are also available, though as a rule less nutritious and somewhat liable to ill-flavor the milk unless fed immediately after a milking. But you should keep on trying to get more protein through some legume which will enjoy your cool and moist conditions. We should keep on trying the clovers, even if re-seeding is required at short intervals, for clovers help the soil as well as the cows and probably make more manure-value under ground than the re-seeding costs. You probably have too little heat and too much wet soil to please alfalfa and therefore the fibrous-rooted clovers, red, white and alsike (which usually holds on longer than others in your part of the State) should have continued trials under different conditions. Your conditions resemble Eastern rather than prevailing Californian, and sowing clover with oats, for a stand of the latter after the oat hay is cut, is more reasonable with you than elsewhere in the State. The way to find the best cow-plants for any section with peculiar local conditions is to keep on trying, and neighbors should cooperate and compare notes along that line.

Proper Pruning of Prunes.

To the Editor: How should we prune apricot trees one and two years from planting?—G. M., Selma.

Trees having made one summer's growth after planting should be cut back during the dormant season following to about 12 inches on three or four best placed shoots which it is desired to retain for main branches and other shoots removed. When the first year's growth is treated that way the next year's pruning consists in selecting usually two shoots of the last summer's growth, which tend in desirable directions, cutting them back to eighteen inches and removing other strong shoots not needed to fill out the desired frame work of the tree. Small shoots on the lower parts of the young tree should be retained for leaf growth. It is desirable to cut out surplus or wrong-growing strong shoots because they will throw the tree out of shape, but it is not desirable to clean off all small growth as some pruners do. These small shoots will bring the first fruit and their activity will tend to reduce the over-strong push of the main

branches. If you have two-year-old trees not properly shortened the first year you will have to prune them rather severely to get lower branching, often cutting into the first year's wood growth to secure that result. This pruning should have been done two months ago or more, but had better be done now than to allow the trees to run farther away from good, strong form.

Is Popcorn Earlier?

To the Editor: What is the feeding value of popcorn for turkeys and hogs? I wonder if it is not too hard to be readily digested. Is it considered as palatable as field corn? I usually save some corn from one year to the next for early fall feeding but this year it was so high that I sold myself short and will have none to fatten turkeys for Thanksgiving. I want to plant an acre of very early corn in order to have it dry in time. I have read that popcorn will yield almost as much as field corn and is good to feed. If you think it will be satisfactory, how much seed will it take per acre? I will want to plant 3½ ft. rows so as not to change the cultivator from the regular corn rows. How thick should it stand in the rows? Do you know of a certain variety that would be best?—S. R. E., Inyo.

Popcorn is evidently regarded as of such little importance in farming operations that analysts and feeding experimenters have practically ignored it. The feeding value of popcorn resembles that of other corn and it can be used in feeding like other corn, and if fed when newly mature is probably more easily reduced by digestive processes than when hardened by keeping over to the second year, which is desirable to secure the best popping. We doubt if you will gain anything in earliness, for popcorn usually takes as long, and sometimes longer, to ripen seed as field corn does. We would rather take our chances for earliness with Extra Early Adams or King Philip, or Pride of the North than with any popcorn we know of. However, if you try popcorn you may come out wiser than we are. Planting as you propose and dropping kernels at eight inches apart will take a little more than two quarts of popcorn seed to the acre.

Pollination of Almonds.

To the Editor: I am told that a Drake seedling almond planted will grow a Drake tree, and can be relied upon to do so. Is that so? Also that a Drake tree will fertilize an I. X. L., also a Nonpareil, because a Drake is a male tree and the others are female trees. That seems to me to be absurd. Is there any foundation at all for such a statement?—Planter, Orland.

All almonds have flowers organically complete, having both stamens and pistils, and therefore it is not true that the Drake is a drake and all other almonds ducks. But though all have organs complete the functioning of these organs differs very greatly in degree. The efficient pollination of almonds is therefore a matter not of organs but of functioning. Drake is a great functioner, both for itself and for other varieties, and this is the reason for the desirability of associating other kinds with it in planting.

Now as Drake is such a good functioner the chances are that the seeds will be strongly inbred and the likelihood of variation reduced—bringing its offspring truer to the seed than others which require cross-pollination. Nevertheless the almond is naturally a great sport and the only way to be sure of Drakes is by budding.

Pumpkins with Corn.

To the Editor: At Princeton, Colusa county, Cal., we intend to plant this season a large acreage to Egyptian corn, King Philip flint corn, and dwarf-milo maize. We are contemplating planting pumpkins between the rows of corn, and would like to know from you if this is a good practice, where the soil is a fertile sandy loam, as it is with us, or will the pumpkins take too much moisture from the corn? It is not our intention to irrigate the corn. When should the pumpkins be planted? Would it be too late to plant them after the last cultivation of the corn? E. H., San Jose.

It might do with irrigation, but we should shrink from doing it dry even with the fine deep loam which we know there is on the river bank land near Princeton. If you are in the low bottom of the river it might work better. You must therefore be pretty sure about what summer moisture you will have, if you expect to get both crops without irrigation. On the bank lands this summer it looks as though you would have to keep the cultivator going as long as you can get through, to get a full crop of corn and you should not get pumpkins in the way, to scant the corn crop and not do much for themselves. We should give all the land and moisture to each crop separately, and plant both just as soon as the location is safe from frost.

Dry Hills for Winter Growth.

To the Editor: I have a hill field of poor red soil I have been raising oats on. It gets pretty dry in summer. Is there any grass that will grow on this hill that would make hay or pasture for cows?—J. G., Potter Valley.

Such dry uplands without irrigation can usually only be counted on for pasture or hay from plants which make winter growth as oats do. If you will let the cows help you by furnishing manure for fall spreading you can get more oats for hay or you can get a lot of rye for winter pasture by early fall sowing. If you sow some bur clover with the rye you will help the cows and the land and you will get better wild winter feed afterwards, if you do not pasture too close in the late spring. We do not know any grass which can be counted on to give you summer feed on such land nor even to hold onto its life through the dry heat.

What Will Brome Grass Stand?

To the Editor: Will Brome grass grow if planted in adobe ground when dry, and then let water stand on it during the winter? I did that this year and it seems to be making poor progress.—Subscriber, Vacaville.

We are not surprised that you slowed it down. Perhaps nothing but eel grass could stand it. We do not know just what Brome grass will live through, but its record is of short life in land which is "distinctly wet" and you struck the "distinctly" all right. The plants which are most likely to survive long submergence, according to our observation, are English rye grass and red clover. Whether they will find moisture enough in your land to live through the summer and fall baking and drying, you will have to determine by trying them. Our notion is that they would survive the submergence.

Succotash Silage.

To the Editor: What is the best bean to plant with silage corn in San Joaquin Valley?—W. D. B., Los Angeles.

We should expect most from the blackeye, though we now know no reason why the soy bean should not do as well for this balanced silage as is now being reported from the Southern States—providing the situation is not too dry to get much of either.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., March 27, 1917:

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka88	25.21	37.77	58	36

Los Angeles00	14.59	13.66	80	46
San Diego00	8.74	8.68	70	46

Grape Little-Leaf Due to Local Causes.

[Review of Paper by Prof. F. T. Bioletti and Leon Bonnet.]

Grape little-leaf (curly-leaf, or yellow leaf) is prevalent all through the San Joaquin Valley and causes loss equal to mildew, vine hoppers, or phylloxera, according to Prof. Frederic T. Bioletti and Leon Bonnet of the University of California in a paper published in the Journal of Agricultural Research. Vines slightly affected show lightish areas on the larger leaves near the middle of canes and have many shot berries. Vines badly affected show small yellowish leaves, short joints, upright canes, and abnormally numerous laterals. They yield very few normal berries, and when the trouble is very bad, they bear nothing and the leaves turn brown entirely or in spots. Affected vines occur in small or large areas with occasionally a vigorous vine surrounded by the weakened ones. A vineyard may lose most of its crop from the disease one year and show practically no sign of the trouble the next, though it may return in later years. No bacterial, fungus, or animal parasite has been found in connection with affected vines. Nursery vines showing the trouble have completely recovered when set in vineyard form. Healthy nursery vines set in other locations have developed the trouble after three or four years. Healthy vines from an unaffected district may show the disease the first year after planting in an affected district. The evidence seems conclusive that the cause is local, whether it exists in soil, water, or weather conditions.

There is a remarkable correlation between coarseness of soil and intensity of the trouble, though vines on coarse soil are not always troubled. This correlation was true in all vineyards examined and at all depths tested (1, 2, 3 and 4 feet).

Moisture Supply.—There seemed less correlation with the amount of water in the upper four feet of soil. But in the vineyard where more tests were made than in any other one (108) there seems to the writer of this review to be an interesting relation between diseased vines and variation in moisture content. This vineyard was not irrigated.

Since grape roots often go over 20 feet deep in well-drained soil as loose as it is in this vineyard, there is reason to believe that the roots of the diseased vines were waterlogged, at least during July. The moisture content at that time four

feet underground was over 11 per cent, while about 14 per cent is all that sort of soil holds without excluding air needed by the roots. In August, the moisture at four feet dropped to an average below 7 per cent; in September below 5 per cent; in November to a little over 4 per cent; coming back in March to nearly 5 per cent; in May over 6 per cent; and June, over 7½ per cent. It may be that the water-table was not far below the four-foot level in July, and that many lower feeders were rotted off. In August, as the water-table receded, their upper feeders dried out, at the same time new ones were following the water-table down at great draft on the vines' already strained vitality. Such strain caused little-leaf growth until the new roots became established in September when new healthy growth began. In October and November the growth appeared perfectly healthy. In the following spring, the first few leaves on all but the worst affected vines were healthy; but as the water-table rose due to irrigation of other vineyards in the district, the disease showed itself on the succeeding growth and in the setting of grapes. It may be that this irregular water table was partly due to the greater evaporation from the coarser soil.

Where moisture determinations were made between healthy vines, the soil moisture at four feet stayed close to the maximum endurable by the roots through July and August, coming down in October not quite to 8 per cent average and not going below that during the year. The high water-table being constant and supplying moisture enough at four feet for growth all through the season, compelled the vines to find their food and water in the upper soil. Few roots being developed within reach of the water-table, there were not so many that could be drowned out in summer; and there was enough water in the upper soil to supply these when the upper roots of the troubled vines were dying for lack of water.

Any other similarly severe cause of reduction in food supply (which depends on about 500 times its volume of water to dissolve and carry it where the plant can use it) may be considered a cause of little-leaf if it operates with notable variation from month to month.

Earliest Cantaloupes, Squashes, Etc.

[Written for Pacific Rural Press.]

Many cantaloupes, squashes, and pumpkins are still to be planted. The season is late, but he who will, can get them ripe a week to ten days earlier than natural by pruning the vines, according to J. E. Johnston of Los Angeles county, who has grown melons off and on since some years before 1910. The pruning has not worked so well on watermelons.

He prunes the cantaloupe tips off with a corn knife when the vines are five or six joints long. This makes them throw earlier laterals which bear fruit. When the laterals have grown a joint or two beyond the fruit of the first crop which will already have set, he prunes off their tips with a quick sweep of the corn knife around the hill. It does not pay to prune for the second crop, which would have to compete with the general first-crop run from unpruned fields.

No irrigation is practiced, but the ground is warmed up early by winter plowing and frequent harrowing. This is practicable on sandy loam soil two feet deep, but if underlaid by gravel at less depth, it must be irrigated.

TALKS ON Nitrogenous Fertilization

Number 12

INTERESTED readers of our "Talks" are asking why Sulphate of Ammonia meets the nitrogen requirements of California soils so well; how it is held in the soil and converted into plant-food; how quickly and for how long its plant-food is available to the plants. For answer, let us glimpse briefly at one of Nature's wonderful processes, which like the brook goes on forever undreamed of by most of us.

All California soils contain alkaline (basic) substances, occasionally in proportions that might limit or hinder plant growth. In so far as it can,

SULPHATE OF AMMONIA

combines with them, the consequent reaction resulting in the formation of ammonium carbonate. A tendency toward soil alkalinity is thus checked, the Sulphate breaking down so that the humous compounds can absorb and hold its ammonia-nitrogen.

Two distinct types of bacteria, and possibly other soil organisms, complete the nitrification process. Under their activities, the humous-bound ammonia is released as nitrate-nitrogen. These manufacturing processes progress steadily, delivering food to the plants about as fast as they can use it.

Quick-acting, all-available, enduring, highest in nitrogen, Sulphate of Ammonia is especially fitted to fill your needs for nitrogenous fertilizer.

RENEWING PEACHES ON THIN SOIL.

[Written for Pacific Rural Press.]

Omitting spring plowing and cultivation for peaches on thin soil over unblasted hardpan made the trees finish a good crop and produce enough fruit wood for a good 1917 crop on the place rented by Frank Henry in Fresno county. There were 125 Elbertas, Lovells, and Muirs six years old. There was less than a foot of soil in some places, and not over two feet anywhere, and Mr. Henry did not want to cut off several inches of that by plowing. In 1915 the trees averaged about three feet growth with a poor finish, showing their resources exhausted. Twelve or fifteen of the trees died back heavily in August and September. These were cut back to live wood and made four to six feet growth last season, finishing with good buds and carrying their leaves till frost. In 1916, there was a fair crop on the more than a hundred of the trees that had not died back. Bur clover and weeds grew thick around them all spring but dried down in June and were left as a dry mulch to prevent evaporation of any more water. At that time the trees had made less wood growth than the season before. They were semi-dormant but not weak, and had quit growing. Then they were irrigated in June and twice later. The fruit got the benefit of the water nine to fourteen days before new growth started. The orchard was plowed the first week of August.

TIMELY ORCHARD SUGGESTIONS.

Apples must be sprayed with arsenate of lead before the leaflets on the blossom ends fold together, or worms will get you.

Dig out the peach borers now or sooner, and paint the trunks at the ground with grade C or D asphaltum or the crude oil emulsion described recently.

Inspect orchards for thrips now.

Time to overhaul the cherry packing houses to determine what supplies will be required. You may not be able to get them on short notice.

Pear and apple scab prevent many blossoms from setting fruit. Spray with Bordeaux when the buds are opening and again when they have just fallen.

Train the trailing berry vines on the ground under the others until fall when the old ones can be cut out altogether.

Watch for cut worms and feed them poisoned bran. They work at night.

PRUNE TREE SURGERY.

To the Editor: Would it be safe for me to do any tree surgery on my bearing prune orchard after the sap runs? I want to dig out decayed wood from trunk and branches and fill with cement or sawdust and asphalt. Would either filling be preferable at this time?—E. J. A., St. Helena.

We would prefer to do it while sap is running; and except for relatively small holes in the trunks themselves, would prefer the sawdust asphalt, especially for crotches and smaller limbs, because it can be repacked later if it loosens from any cause.

Olive Trees

such as these are grown only on our foot-hill locations —
Note the good roots — for hardiness they have no equal.

We have a fine block of Mission and Manzanillo trees—both on PICHOLINE roots and grown from cuttings. We have had splendid success on all olive plantings—a most important assurance to you.

Spray for Walnut Aphids.

[Written for Pacific Rural Press.]

Some walnut trees in summer get sticky and dirty. Drops of sticky syrup fall from them to the ground. These come from millions of lice which suck the living out of the trees and nuts. Then in the fall, these nuts have to be separated from the sound ones by special machinery in the packing houses or they spoil the reputation of our State.

A Ventura county grower last fall mentioned a neighbor who lost 25 per cent of his crop that way.

The aphids live over winter only in the form of eggs stuck to trees usually in protected places such as leaf scars, etc. They begin to hatch a week before the buds open and at once seek the swelling buds or new leaves. Spraying is effective if well done before or after leaves unfold.

Winter Spraying up to the time the spray would reach the insides of the buds is so much easier, and requires so much less spray, that it seems far more economical than to wait until leaves are on and some damage done. Whether it is needed can be told by examining for the oval black eggs as long as the diameter of a small pinhead.

Lime-sulphur 1 to 8 kills the eggs and does not injure the tree until buds unfold. Crude oil emulsion up to 12 per cent has proved less effective in experiments by U. S. Dept.

Agr. Trees lime-sulphured in winter by the University of California in southern coast counties yielded fewer culls the first season, and made as much of a crop as unsprayed trees. They made greater and more vigorous fruit wood growth, so that both quality and quantity of the following crop were greatly better than on unsprayed trees. Extra lime is used so workmen can see better where they have sprayed. Prof. R. E. Smith recommends 5 gallons commercial lime-sulphur and 25 pounds of quicklime slaked and strained, per 95 gallons of water.

Spring Spraying.—On varieties and in districts where growth has already started, a different spray may be used if lice can be found on the growing tips. The killing agent in this will be Blackleaf 40 one pound per 200 gallons. Four pounds of whale oil soap are added as a spreader. This may have to be repeated later if not all of the eggs are yet hatched, or if trees are reinfested from neighboring unsprayed orchards.

The sooner a thorough spray is applied to infected orchards, the better it can be done, with least labor and material. It is especially hard to do effective spraying in big walnut trees when they are filled with leaves, on the under sides of which the aphides feed in security.

Pinching for Second-Crop Grapes.

[Written for Pacific Rural Press.]

"To what do you lay your big crop of Thompsons?" we asked B. H. Fisher of Kerman last fall. Between his four-year vines were paper trays in every row, nearly enough to make 1½ tons per acre of raisins. One vine of six fat canes had over 117 pounds of plump grapes, some of them finely colored and most of them in big bunches. From 46 vines he picked 145 trays, and from two vines 12 trays.

"Pinching," he said.

He had gone through the vineyard in spring when the shoots were just a few inches long and the forms of bunches just breaking away, pinching the terminal buds from the shoots, doing it fast with both hands. This started the laterals at once, so the second crop ripened very nearly with the first and it enlarged the soft tissues of the stem of the bunch already formed, so that it always did carry more sap to the berries than it could otherwise. It diverted sap into fruit growth rather than allowing it to make long canes of useless wood.

Mr. Fisher had a light crop on two-year vines in 1916, and they finished up strong fat canes for the 1917 crop. He noticed on neighboring vineyards that there were many

small bunches and usually only one per shoot. Pinching is only one of the operations in the Henry system which Mr. Fisher followed closely in time of plowing, methods of irrigation, cultivation, etc., as reported in Pacific Rural Press from data supplied by parties who have succeeded by the system.

FIG TREES OVERBALANCED BY PRUNING.

[Written for Pacific Rural Press.]

Fifteen Black Mission fig trees planted on the J. C. Furgeson Ranch in San Diego county 30 years ago by a schoolgirl in two rows, about seven feet apart each way in a beef pasture, are 25 feet tall and bearing a good crop each year, though not plowed or pruned for 12 years.

Overbalanced and Nearly Uprighted.—Twelve years ago most of the limbs extending between the two rows were chopped off. The trees now look like large oaks, but all their big branches are toward the outside of the double row. The trees lean almost to 45 degrees and the ground is cracked between the rows so they seem in danger of uprooting themselves.

Canneries have been paying \$42.50 to \$45 per ton for 1917 cling peaches in San Joaquin Valley.

GUATEMALA AVOCADO NURSERY

E. E. KNIGHT.

"The Avocado of Guatemala form a distinct group * * * and from a commercial standpoint, the most promising for introduction into our tropical possessions. The thick-skinned round and thick-skinned oval are probably the most promising, owing to the thick skin, good keeping qualities and fine flavor."

WRITE FOR BOOKLET OR CALL.

Mr. Grape-Grower

It is almost time for MILDEW

Remember: "A puff in time saves the vine."

Read this extract from a letter to grape-growers of Tulare County by C. F. COLLINS, County Commissioner:

"Wherever this disease (MILDEW) was prevalent last season, millions of spores are now lurking, waiting proper atmospheric conditions to begin their work of destruction, and their control is very difficult after they have begun active operations upon the vines. The secret of success lies in 'doing them before they do you.' The best authorities agree that winter spray for mildew is practically useless, and that liquid spray at any time is more expensive and less efficient than dry sulphur. * * * Ten times as much can be accomplished at this time with one-half the expense, as can possibly be done one month later."

YOU KNOW how necessary it is to do the work quickly when the right day comes. READ THIS extract from a letter from S. C. DAILEY, a grape-grower of Kingsburg, Cal., concerning

THE AMERICAN SULPHUR MACHINE.

"I used one of your AMERICAN BEAUTY machines in my Emperor vineyard last season, with perfect success. Emperors are especially hard to keep free from mildew, as you have to irrigate them so much to produce good fruit. This over-irrigation makes the mildew grow, if it has the least chance. The year before I used more sulphur with a foreign machine, and there were lots of grapes damaged. I attribute my success last season to the fineness and volume of the cloud of sulphur thrown by the AMERICAN BEAUTY SPRAYER. After using it there was not a trace of mildew in my vineyard. Your machine works twice as fast as my old one."

DON'T LOSE VALUABLE TIME tinkering with a poor machine. A few hours lost at a critical time may cost you your crop. Send us \$11.00 for a vineyard size, or \$13.50 for an orchard size machine, and we will send you an AMERICAN BEAUTY DUST SPRAYER, all charges paid. Try it. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money.

WE FULLY GUARANTEE EVERY MACHINE.

INTERCROPPING YOUNG DECIDUOUS ORCHARDS.

(Continued from first page.)

added breeding places for red spiders which also attack many orchard trees seriously. B. B. Green of Sacramento county harvested 43,437 pounds of bayou beans from 23½ acres of two and three year pear trees; having inoculated the beans and planted them five rows per tree row. He figured on the fertilizing value of the vines as well. On the Carroll ranch in Orange county, four to six rows of lima beans were grown between young orange trees set 24 feet apart on 90 acres, getting about 15 sacks per acre actually occupied by the beans.

PRUNING AFTER BLOSSOMING.

To the Editor: I did not prune my four-year peaches and apricots, expecting to save enough buds from the birds so there would be a crop. Now the peaches are loaded with bloom and the apricots are setting. Would it hurt crop or trees to prune them now?—J. J. G., Terra Bella.

Prune the apricots now and the peaches as soon as they are set. There will be a slight set-back, but the damage will be less than to leave the fruit on.

RESTORED YELLOWED ORANGE TREES.

About 50 four-year orange trees had been planted over dynamited hardpan by Adolph Butze of Tulare county, and they were very yellow. Six haywagon loads of pure horse manure were applied. The trees became green and have not yellowed in the four years since. They are bearing good crops now.

OLIVE TREES FROM SPLIT STUMPS.

From 3½ acres of Ascolano olive trees which were cuttings three years ago, T. Copeland of San Diego county picked \$35 worth of fruit last season. The cuttings were made by splitting the stumps of old Ascolano trees which were given to him if he would dig them out. They have made a fine growth.

DOUBLE WORKING ALMONDS

Apricot root is considered less affected by peach borers and crown gall in the Banning district than almonds, so almonds are being double worked on apricot roots. J. J. Haugh has started three acres this way. French prune is root-grafted on the apricot and in the following year the almonds are budded into their tops or whip-grafted.

PUMPKINS AMONG PRUNES.

Fifty dollars per acre for a hill of pumpkins in the center between each four prune trees is reported by J. E. Beerney of Kings county, concerning the orchardist from whom he bought the pumpkins at \$4.50 per ton delivered. He fed them to the hogs but figured it didn't pay very well at the price.

The Eldorado County Supervisors have rescinded their action abolishing the office of County Horticultural Commissioner.

Olive Trees

Read This Letter from the Secretary of the Los Angeles Olive Growers' Association:

Los Angeles, Cal., March 14, 1917.
Fancher Creek Nurseries,
Fresno, California.

Gentlemen: I desire to write you and express my views of the present situation relative to the Olive Industry, and would say that at the present time there is more demand for the products of California Olives than at any time in the past history of the State of California. It would be possible today to sell for delivery out of the next crop, which will mature in November and December, three or four times the amount of the visible supply and at prices which would render the grower a good return upon the money invested and labor employed. The former consumers of the Imported Green Olives have more rapidly during the past twelve months turned their attention to the California Ripe Olives, than in any similar period of time ever before experienced. It is reasonable to believe that after they once become accustomed to the California product, they will never revert to the Green Olives on account of the superior food values to be obtained through the use of the California Ripe Olives.

The Industry looks encouraging for the reason that it provides a product that can be put up in cans, so it is not at the mercy of the market, the same as a perishable article would be. Those looking for a product upon which they may reasonably expect an advanced increased consumption can make no mistake in selecting California Ripe Olives.

Yours truly,

FRANK SIMONDS,
Secretary.

- There is a shortage of Olives in California.
- California Olive Oil is practically all sold out.
- There is a strong demand for California Ripe Olives.
- Prices for trees are lower than they probably will be next season.
- The next five or six weeks are ideal for planting.
- We have a magnificent stock of Manzanillo, Mission and Ascolano, which are the three best varieties to plant—all propagated from bearing trees in Mr. Roeding's orchard.
- Special quantity prices on application.

Heavy Sudan Hay and Pasture.

[Written for Pacific Rural Press.]

Among the enthusiastic Sudan grass boosters we have met the past winter is J. H. Trainer of Butte county, who planted 80 acres to that crop last year under about as adverse conditions as one could think of; and still got a heavy crop of hay and a lot of good pasture.

The land on which Mr. Trainer grew his Sudan was almost totally dried out in May when he plowed it; and it was the latter part of May when he planted the seed. He drilled it in with a six-foot drill, using 14 pounds of seed to the acre; and harrowed the field well afterwards. There was both adobe

and sandy soil in the field and little difference was seen in the yield on the two soils.

Ordinarily he believes that the best time to plant is just after all danger of frost is over; for he noticed that the first frosts last fall nipped it badly. Of course the moisture most years in early spring is sufficient to insure a good stand.

During the growing season, he cut a good crop of hay, finding that the best time to cut it is just as it goes into the blossom. After harvesting the hay, he pastured it heavily with dairy cows till the first winter frosts.

Not only was he satisfied with the yield but he also values it highly as a cattle feed. He fed the Sudan hay with alfalfa hay to his 60 cows, Sudan constituting the major portion of the ration.

As soon as the Sudan pasture was high enough to pasture, he turned the entire herd into the field; and after five milkings he was getting 10 gallons more milk daily from the 60 cows than he had previously secured from the alfalfa-Sudan-hay ration. One good thing about the Sudan pasture is the freedom with which it may be used without fear of bloat. This year Mr. Trainer will have a like amount of land planted to Sudan and expects very much heavier yields than he secured last year.

A pageant showing the romance of California agriculture will be presented at the dedication of Hilgard Hall at the California College of Agriculture October 13.

IRON AGE

Farm, Garden and Orchard Tools

Answer the farmer's big questions. How can I grow crops with less expense? How can I save in planting potatoes? How make high priced seed go farthest? The **IRON AGE Potato Planter** solves the labor problem and makes the best use of high priced seed. Means \$5 to \$30 extra profit per acre. Every seed piece in its place and only one. Saves 1 to 2 bushels seed per acre. Uniform depth; even spacing. We make a full line of potato machinery. Send for booklet today.

TRANSPLANTING SWEET POTATO PLANTS.

[Written for Pacific Rural Press.]

When sprouts from sweet potatoes in the hotbed as described in a recent issue, show leaves above ground, they are pulled for transplanting. The largest are pulled first. This has to be done carefully to prevent breaking the sprouts, which are covered with roots. F. L. Landram of Merced county commences planting April 20 if the ground is warm outside; and does not continue later than June 1 on account of fall frost danger as well as the probable shortage of water late in the season.

As the plants are pulled, the leaf heads are laid together and the roots cut off to about four inches long. They are protected from drying out until planted. The field is worked fine and put into ridges 14 inches high and three feet apart.

Planting and Culture.—Three men including the driver transplant two acres per day by machine. The machine opens trenches on two ridges at once, and closes them soon afterward. In the interim the two men sitting on the machine close to the ground, insert plants in the opened trenches about 14 inches apart. A water tank on the machine automatically wets the trenches, and is refilled from the irrigation ditch at the end of each row. There is no hoeing except to cut out the weeds. The plants are irrigated three or four times per season and cultivated after each except the last, when the vines are in the way.

After the vines begin to run, need of irrigation is told by their tips, which show lack of water before any other part of the plant, by drooping. Water is then necessary at once.

CUT OUT CORN SMUT.

To the Editor: Will bluestoning corn prevent smut?—J. S. H., San Jose; E. J. A., St. Helena.

No. Corn smut lives over in the soil, also in manure of stock that has eaten smutted stalks or grain. The only way to control corn smut is to cut and burn every affected stalk in summer time before the smut pustules have broken and allowed the spores to spread.

The Humboldt County Farm Loan Ass'n has been widely misquoted as having secured approval of loans desired by its members, from the Federal Farm Loan Board at Washington. No such loans will be approved until the District bank is in operation.

What You Get With GOODRICH BLACK SAFETY TREAD TIRES

HAVE you ever taken stock what you get WITH as well as IN a Goodrich Black Safety Tread Tire?

You know, of course, you get the *best non-skid fabric* tire, the oldest, largest, most skillful rubber manufacturer can make, and get it at the *low standard ONE-PRICES* of the *Goodrich Fair List*.

You know you get the toughest tread, rubber compounding has yet produced, and all the seven cardinal tire virtues—style, comfort, safety, economy, durability, freedom from tire trouble, and mileage—IN a Goodrich Tire.

But have you looked deep into the Goodrich *pledge of perfection*, and *Goodrich Fair Treatment*, which go WITH each Goodrich tire, and require a service worthy of the good name the tire bears?

Goodrich Tires Must Make Good

If, as occurs in rarest instance, a tire fails to render its service, the B. F. Goodrich Company is more eager than you that its short-coming be made good.

Bring back a Goodrich tire that owes you anything: is Goodrich's invitation to the world.

Goodrich Fair Treatment at once cancels any debt of a Goodrich Tire—makes good quickly, generously, and gladly.

Certainty of utmost service is what you get WITH a Goodrich Tire

"Best in the Long Run"

HEAVY CROP OF EARLY POTATOES.

[Written for Pacific Rural Press.]

After J. C. Heffley of Imperial county cut up his White Rose potato seed this year, he immediately sprinkled them with fine dry sand to dry off the cut surfaces. He expected their dry outsides to prevent their rotting if ground should remain cold long after planting. That this sometimes happens is evidenced by a note from Fresno county saying potatoes planted two months are not up.

He claims about 17 tons per acre usually ready for market by May 15, having been planted Feb. 10 to 15.

Potatoes 20 days earlier are produced from the eyes of the seed end, according to Mr. Heffley, than from the stem end. He cuts the seed end into four pieces to get as much as possible of that sort.

In planting, he runs an eight-inch shovel through the field to make furrows three feet apart. Seed pieces are spaced about 10 inches apart and a furrow thrown over them from each side leaving them about four inches deep.

The field is irrigated soon after planting, and springtoothed just before the potatoes come up. Two more irrigations and cultivations are required.

SIDE-HILL CORN CULTIVATION.

When the silage corn field was planted on the Stephens Dairy at Mission San Jose last year, a side-hill field was chosen and the rows were run up and down the hill to facilitate cutting with a binder.

It was not noticed at planting time that the planter ran at a different depth when going up the hill than when going down but when the corn plants got above the ground it was seen that across the entire field two rows would be good and the next two poor; and at harvest time this made a material difference in the yield.

It was then remembered that in going up hill the planter was always tipped backward while in going down hill the opposite was true. Thus the rows planted on the up-hill round were shallow planted while the down-hill rows were deep planted.

To overcome the difficulty this year, the runners are raised about two inches when the down-hill rows are being planted and are sunk in as deep as they will go on the up-hill rounds. This makes for uniform depth of planting.

OLD BLIGHT-RESISTANT CHINESE PEAR.

To the Editor: The following may be of interest to your correspondent, R. J. R., Sacramento: Forty-one years ago I was working with the second largest collection of pears in the United States. It was known as the Satterwaite collection, near Philadelphia. The trees were pruned in Espalier style and the land cropped. The trees used to blight badly, though I do not recollect any of them being destroyed entirely. There was one tree known as the Chinese sand pear that was blight-resisting and very vigorous. My recollection of it is that the leaves

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs. Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft. No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-.

JOHN DEERE, MOLINE, ILL.

The John Deere-Dain System Rake

Here is what you do with the Dain System Rake:

Follow the mower closely, rake while leaves are still active and place hay upon clean stubble.

Make straight windrows, and no dumping of rake is required. There is no bunching of hay in turning corners.

Put the hay in medium size windrows, with the bulk of the leaves inside and the majority of stems outside.

The windrows will be loose in the center for the free circulation of air. The hay retains its color and nutrition.

[The John Deere-Dain System is the rake employed with the Dain System of Air-Curing Hay.]

Reel raised or lowered, rake thrown in or out of gear and angle of teeth changed by means of convenient levers.

Ample capacity. The inclined frame grows higher where the windrow becomes larger—an exclusive Dain feature.

John Deere Harvesting Machinery

John Deere harvesting machines have worked under every possible condition—severe droughts that resulted in much light grain, short and irregular straw—extremely wet seasons, heavy grain, down and tangled.

However, the John Deere, "The Better Binder", has throughout maintained an unbroken record of success in cutting, binding and tying grain.

The John Deere Grain Binder has wide and high bull wheel—great power. Main frame riveted—unusually strong.

Three packers instead of two, make better shaped bundles and save grain.

Accurate tying mechanism.

Quick turn tongue truck saves time, relieves horse and makes square corners and full swaths possible.

John Deere Factories

Every implement bearing the John Deere trade mark is made in a John Deere factory.

To insure the best in every class of implements there is a special John Deere factory for making each class. John Deere Plows are made in a plow factory; their hay-tools in a hay-tool factory; their planters in a planter factory.

Every tool in the John Deere line is made in a factory organized and equipped to make such tools.

All John Deere factories are in communication with each other. Each has the benefit and experience of all.

When it comes to purchasing raw material, John Deere factories as a unit, represent an enormous buying power. This is an advantage to purchasers of John Deere implements.

Don't forget that each John Deere factory is a leader in its field—that every implement it turns out is worthy of the name, "John Deere."

JOHN DEERE, MOLINE, ILLINOIS

160 ACRE FARMS IN WESTERN CANADA FREE

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat around \$2 a bushel and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

GILBERT ROCHE, Canadian Government Exhibit, San Diego, Cal. Canadian Government Agent.

were thick and glossy like a laurel. The fruit was very handsome in size and color, like a Bartlett, but waxy, artificial looking, no value for eating purposes. Chas. Blom. Napa.

Kill Squirrels Gophers

The only exterminator that is 100% efficient and guarantees results or money back is

KILMOL SQUIRLGOPHENE

Used and endorsed by biggest and most successful ranch owners. Prepared with balls saturated with KILMOL give best results.

New formula of U. S. Gov't Poisoned Barley is effective in dry weather.

General Agricultural Review.

GRAIN AND FIELD CROPS.

Diseased potatoes should not be planted in uninfected ground.

Wheat prices are soaring and flour is jumping, so that bread must soon rise.

The growers of about 800 acres of onions in Riverside county have prospect of a fine crop.

The 1916 rice crop in Ecuador was a total failure for lack of water, but 15,000 tons are expected this year.

About 400 acres of sugar beets are being planted in Owens Valley, Inyo county, under contract to the Holly Beet Co.

The U. S. marshal seized 4800 cans of soya beans at Fresno, which were labeled "navy beans" and were to be shipped to Honolulu.

The freight rate on rice from Hong Kong to the Pacific Coast has been raised from \$10 to \$15 per ton. This may help California growers.

Early potatoes in San Gabriel Valley, San Fernando and Los Angeles districts, and Orange county are estimated at 8700 acres this year.

T. H. Kearney of the U. S. Bureau of Plant Industry writes that he originated the Yuma and Pima cotton instead of E. W. Hudson as

stated in our issue of Feb. 17. Mr. Hudson is active in securing its commercial introduction.

The Pahrump Valley Company of Los Angeles has completed arrangements for the planting of 200 acres of cotton in the Pahrump Valley, Nevada, near Las Vegas.

Forty produce growers of the San Bernardino Valley organized Mar. 22 to market direct. Geo. M. Cooley was elected president. Dues are 50 cents per acre per year.

The quarantine against Indian corn or maize from the Orient, which has been in effect since July 1, 1916, has been modified by the Secretary of Agriculture, effective April 1, allowing corn to be imported from Japan and Manchuria under regulation.

How to increase the production and improve the quality of potatoes has been the subject at several meetings held this week in the foothill sections by the State Horticultural Commission. E. V. Grubb the Colorado potato expert, addressed the growers.

Imperial County truck crop acreage is estimated by U. S. Dept. Agr. as below: 12,700 acres cantaloupes, 635 acres Bermuda onions, 400 acres early potatoes, 925 acres green peas, 960 acres lettuce, 565 acres watermelons, 250 acres summer squash, 125 acres strawberries, and 283 acres asparagus.

DECIDUOUS FRUITS AND NUTS.

So far, there is nothing to prevent a record pear crop in the Tehachapi district.

Spraying to prevent June drop of oranges is not yet recommended by the University of California.

Contra Costa orchardists are spraying with distillate emulsion and tobacco extract for thrips.

Frank Difore of Berryessa is the latest elected trustee of the prune and apricot growers' organization.

Senate bills 1110 and 458 for better shipping fruit standardization and county horticultural co-operation have been recommended for passage.

The State Market Director's appointee on the Board of Trustees of the California Prune and Apricot Growers, Inc., is M. J. Madison of Alameda.

Members of the prune and apricot growers' organization may sell their fruit to outsiders for fresh consumption or for canning after satisfying the organization that such fruit will not be dried.

E. J. Vosler, who went to Australia recently for the State Horticultural Commission, to find beneficial insects to prey on our fruit pests, was very cordially received by Government officials.

At the largest meeting of almond growers ever held in California at Chico March 10, 82 growers representing over 1000 acres organized a local association and affiliated with the California Almond Growers' Exchange.

The State Market Director's appointee on the Board of Directors of the California Prune and Apricot Growers, Inc., is W. G. Alexander of San Jose, a man who has proved great ability in executive positions and has been known in his home town for 22 years.

Among the fruits intercepted by the California Quarantine officials during February because of pests, were sweet potatoes from China, pineapples from Hawaii, oranges and lemons from Tahiti, sweet potatoes from Mexico, potatoes and apples from Washington, and other products from other states. Ninety-six per cent of horticultural imports were passed as free from pests. These came in 263,667 parcels on 119 ships.

CITRUS AND SEMI-TROPICAL.

Redlands orange pickers have demanded from the packing houses 5 cents per box or \$2.50 per nine-hour day.

At Riverside, 120 white orange pickers recently struck for an increase from \$2.25 to \$2.50 per day and got it.

Lindsay shipped 446 boxes of Washington navel in October, 102,069 in Nov., 290,042 in Dec., 22,730 in January and 18,000 in February, according to figures published in the

C. C. Jenkins, a big tooth-pick manufacturer of South Dakota, was at Redlands last week. Mr. Jenkins is in Southern California buying up orange wood for his tooth-pick factory.

A former Porterville man now living in Virginia writes that Florida oranges are preferred there because California oranges are too sour. The Florida oranges are seedlings, have fibrous centers and less attractive skins, but they are sweet.

GRAPES AND SMALL FRUITS.

Bulletin 477 of the U. S. Dept. Agr. treats of strawberry marketing.

The Las Palmas Vineyard Co. of Fresno is grafting 60 acres of wine grapes to Malagas.

Buyers are contracting for San Joaquin Valley table grapes at \$100 per ton on the vine.

Strawberry acreage in the highest five producing States is estimated by the U. S. Dept. Agr. at 24,300 as against 27,400 last year.

Seventeen Happy Valley, Shasta county, berry growers recently organized and will sell their entire crop through one local firm.

Strawberry growers of Monterey, Santa Cruz, Santa Clara, and Alameda counties have formed an association which is said to represent 75 per cent of California's output.

MISCELLANEOUS.

A stump pulling bee was recently held in Sonoma county with a Fitzpatrick K Power stump puller.

Make all farm loans through your local farm loan associations. Swindlers are out trapping the unwary.

The Ohio Experiment Station recommends that potash fertilizers be not used for field crops on account of its high price.

Kills Prairie Dogs, Ground Squirrels, G. Hogs, Pocket Gophers. Saves alfalfa. Experimental stations approve. 1400 tablets, P. P. 81.25. Warranted. Mole Tablets, 75c. Ask Druggist or send direct.

Sudan Grass

CALIFLORA BRAND

This is one of the best-known forage crops used in the Southern and Middle Western States. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—1b. 50c; 10 lbs. \$4.00; 100 lbs. \$35.00.

Alfalfa Seed

CALIFLORA BRAND

This is our best grade of common Chilian alfalfa seed. On every test this brand of Alfalfa Seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample.

We also offer superior stocks of GRIMM, HAIRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

The farm loan bank at Berkeley has applications for loans totaling over \$15,000,000. The interest rate will be 5 per cent.

The Washington State Experiment Station will supply Washington farmers with pure cultures of legume bacteria at a cost of 25 cents per acre.

A good-sized community vegetable garden has been laid out in Diablo Park, Contra Costa county, and many varieties of berries have been planted.

Potash production in U. S. during 1916 was 10,000 tons, worth \$3,500,000. In 1915 it was 1000 tons. Most of it comes from Nebraska alkali lakes.

Washington State has provided for a director of farm markets and assistants to investigate, encourage, and develop market conditions within the State.

Yuma, Arizona, water users are objecting to the project of putting in a temporary weir for the benefit of Imperial Valley during summer, because they fear floods.

In only one case per 89,000 operations have the Southern Pacific automatic block signals failed to work. When they fail, they make the trains wait. There are about 7,000 such signals on the system.

The Tulare County Board of Trade estimates the value of that county's products last year as follows: Citrus fruits, \$3,883,495; dairy products, \$2,500,000; cattle \$1,656,825; raisins, \$1,350,000; fresh fruits, \$1,379,000; grain, \$1,250,000; hogs, \$1,248,000; cannery products, \$1,000,000; and poultry products, \$500,000, besides many other items.

OF GENERAL INTEREST.

C. Hugh Wren of Orland has been appointed Glenn County Horticultural Commissioner to succeed Carl Ley.

Miller & Lux have joined the Madera Irrigation Bureau in working for an irrigation district in that county.

NOTES ABOUT FRUIT CROPS.

Orange County Horticultural Commissioner Roy K. Bishop made a thorough canvass of deciduous fruit prospects and advised us on Mar. 24 as follows: Apricots have set the biggest crop that we have ever had, the fruit is so thick on the trees that it will have to be thinned. This is also true of peaches and plums. The walnuts are just coming out but the conditions are most favorable and indications are that there will be a very fine setting of nuts. The frosts of the 9th, 10th, and 11th of the month were not severe enough to injure the blossoms.

Alameda. — Heavy blossoming of cherries and heavy setting of apricots, pears, etc., are stirring up a move for revival of the Cherry Festival.

Fresno. — Apricot crop almost wiped out except where smudged. Peaches hurt in lower districts. Frost killed strawberry blossoms and vegetables.

Santa Clara. — Elevation will play an important part in the prosperity of Santa Clara apricot growers this season according to observations of our publisher. Coming down from the hills on the east side, on Mar. 25, he stopped at an elevation perhaps 200 feet above the floor of the valley and cut a representative twig from under a big branch and about six feet from the ground, which is overloaded with apricots plump and sound all through, averaging a quarter inch small diameter. Stopping at about 100 feet lower elevation, he cut twigs similarly located on the trees, from an old tree and from a young one. These had not been well nourished as we judge by the amount of new growth on the old tree and the shriveled new growth on the young tree. But there is a reasonable crop on the old tree if it matures as it is likely to, though it contains a few frosted fruits. All are smaller than on the higher elevation. The twig from the young

tree lost all of its fruit, perhaps partly because it was more exposed to cold, and partly because the buds had been weakened by lack of water last fall.

Another branch taken from a tree on the floor of the valley also shows

short growth, but what there is of it is well supplied with apricots, small but sound. This orchard was smudged. Cherries and prunes in full bloom.

Tehachapi. — Every prospect so far for a fine crop of pears and apples.

Smooth Lock Seam Sleeve

Here is an exclusive Madewell feature that appeals to every user of Surface Pipe. Seamed inside with perfectly smooth surface. Much stronger than the old-fashioned lapped and riveted seam used by others.

Madewell Surface Pipe

is recognized in established surface pipe districts as having the strongest, smoothest, and most practical construction.

Our Long Lock Seam is the best seam possible to make—and in addition is carefully soldered the entire length so that it stays water-tight. Strength and Smooth Finish are the big things to consider when you invest in surface pipe.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Milo Better than White Egyptian.

[Written for Pacific Rural Press.]

Milo and white Egyptian corn grown in the same field, six acres of one and two of the other, showed that the grain of milo resisted birds much better, and the stalks were much preferred by cattle. This year the white Egyptian will not be grown.

In August, when in the milk, birds attacked the white Egyptian, and as it hardened, shelling more freely, they ate and threshed out a large per cent of each head, stripping many of them bare. We cut the heads from the Egyptian first, using them for turkey feed. After this variety was gone from the field, the birds worked on the milo, but the extent of the damage was what they ate, as the milo does not thresh from the head readily. Neither did the birds work so constantly in the field after the Egyptian was gone.

Cattle Preferred Milo Stalks.—In September the field was cross-fenced and thirty-six steers turned into parts at a time. Most of the grain was headed before turning the cattle to it. At all times they had access to both varieties, but invariably used the milo first. Both kinds were green when the cattle were turned in. The Egyptian showed no dry leaves at all, but the milo showed some at bottoms of stalks. The cattle ate all the leaves and all the smaller stalks promptly, and as the season advanced, and the new sections of the field were all worked over, they would go over the ground, using everything up except some of the largest stalks, which were affected by rain and frost before the supply was exhausted.

No trouble was experienced from new growth after the fall rain, because there was so little it was negligible among so many animals.

Culture.—The field is sandy loam river bottom, subirrigated, but with rather too much alkali for corn growing.

Fresh plowed to turn under a rank growth of weeds. Worked down with disc and spike-tooth harrow. Sown last of April too early, with grain drill, plugging outlets to make rows two feet apart. In May whole field was frosted badly, but came out all right in a few weeks although most of the plants were frozen back to the ground. About the last of May the field was harrowed once over with the spike-toothed harrow. This was the extent of its cultivation for the season.

The milo stood a little more than the gyp, but the stalks were not quite so large. In the best drained parts of the field both kinds grew rank and attained a height of ten feet or more. As many as twenty-three well-developed heads were matured on a stool of milo.

STANDARD WIDTHS FOR WAGON TIRES.

As the result of a long series of traction tests on earth and gravel roads, the U. S. Department of Agriculture recommends in Circular 72, that the following widths of tire be adopted generally for wagons of different carrying capacities.

Type of wagon	Gross weight loaded	Width
	Pounds	Inches
1-horse wagon	2,000	2
Light 2-horse wagon	3,500	2½
Medium 2-horse wagon	4,500	3
Standard 2-horse wagon	6,800	4
Heavy 2-horse wagon	7,500	5

These five types, says the circular, should be sufficient to meet all the needs of farming operations and general work, except the heaviest trucking and certain specialized hauling which is likely to be confined to city pavements. The circular recommends, therefore, that a name be adopted for each of these sizes and that the wagons be designated not by the size of skel but according to their gross load capacity. The gross carrying capacity

of the wagon should be shown, it is said, by stencil or plate on the back of the rear axle. The size of skel for the five types of wagon named

vary, says the circular, from 2½ or 2¾ inches for a 1-horse wagon to 3½ inches for the heavy 2-horse wagon.

790 Bushels of Potatoes

PER ACRE, THE LARGEST CROP
ON RECORD IN THE U. S.

Were grown in California and awarded Grand Prize by International Jury, P. P. I. E. Not only was this the largest crop, but the quality was especially fine, bringing a price considerably above the market. The grower attributed a good part of his success to the use of

Gold Bear Fertilizer

The average crop of California is about 150-bushels. What do you get?

W. V. Shear, Potato Expert, says: "Don't try to save money by adopting cheap methods to cut from cost of production. Is it not good business practice to spend enough money to produce a good crop and make money on the investment rather than use cheap methods and lose money?"

Fertilizing is not an expense, but an investment, yielding immediate returns.

Let us help you solve the problem of bigger and better crops.

Four Years of Successful Alfalfa Planting

WESTROBAC GETS RESULTS

San Jose, Calif.
March 19th, 1917.

Western Soil Bacteria Co.,
442 Sansome Street,
San Francisco, Calif.
Gentlemen:

For the past four years we have used Westrobac in inoculating alfalfa seed, and have in every case obtained a strong, vigorous stand.

In some cases the soil was alluvial; in others adobe. Sometimes there was too much rain, sometimes too little. Frequently severe frosts followed the sowing, and fell on the very young plants.

We have sowed both in the spring and in the fall, but under varying conditions have always been successful.

I should never think of sowing alfalfa seed without using Westrobac to inoculate the seed.

Yours truly,

(Signed) FRANCES R. SCHALLENBERGER.

Westrobac is bred exclusively by the

Western Soil Bacteria Company

422 SANSOME STREET,
SAN FRANCISCO, CALIF.

Avoids Soil Washing on Hillside.

[Written for Pacific Rural Press.]

Orchard soil on a steep hillside is likely to be washed out, as even grain may be during heavy winter rains. F. E. Judson's brother in San Diego county nearly lost a hillside of grain during the heavy rains of a year ago, but F. E. has a four-year peach orchard on the same sort of a slope which was in perfect shape when seen during the mid-January rains last winter.

The tree rows had been planted in straight lines up and down the hill and at right angles to these in the other direction. Beginning about three feet below a tree row, the dirt was plowed and scraped down hill until the space to three feet above the next row was almost level, but sloping slightly upward to the outer edge. These level spaces between trees were run around the hill with just a slight slope, so irrigation water would follow them; but storm water would not likely get up much headway to wash gullies. A straight row across the hill might thus include trees on slopes between several terraces.

Straw manure was placed along the outer edge of each level terrace to help dam back the storm water and hold the soil which might wash up against it. This gave a tendency for the hillside to terrace itself more securely each year.

The steep slopes in the middle of which stood the trees, were last winter covered with weeds and straw manure, while the terraces were catching and absorbing water for this summer.

The only down-hill runs for storm water were the brushy draws into which the terraces drained.

This sort of terracing may be done any time when other work is not pressing, though while the soil is moist, it would work easier. Where it is done among trees already planted, the roots will be considerably torn on the lower sides of trees. Irrigation is simple, water being run around the base of each slope in a single furrow. It sub-irrigates downward for roots of trees below.

ALFALFA

250 lbs. of Mococo Superphosphate per acre will increase the yield of alfalfa enormously. "In some cases the alfalfa growth has been tripled," writes Mr. F. F. Lyons, San Joaquin Co. Farm Adviser. Write for particulars. THE MOUNTAIN COPPER CO. 832 Pine Street, San Francisco.

He'll Make You Poor — KILL HIM

What is the use of preparing a good seed bed and planting seed that cost good money if you let squirrels and gophers eat your profits. These pests are a constant danger to crops and a constant menace to the family's health.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

GARDEN FOR FOUR PEOPLE.

Before ordering seed the home gardener would do well to look over his garden plot, decide on the best location for each vegetable, and determine how much he will require for the space available for each variety.

He will find it helpful to make a rough plan of his garden on a large sheet of wrapping paper. On this plan he can indicate the spaces to be used for each variety and also by means of colored pencils or symbols show where a second crop is to be planted or interplanted between growing rows, and also arrange for the second and third crops which are to follow those previously harvested. Such a plan will enable him to keep the garden busy all season supplying fresh vegetables during the summer and producing in the late fall roots and other crops for winter use. Once the heavy preliminary spading and working of the garden has been done, it is about as easy to raise two or three crops as to keep the garden clean of weeds to produce only one picking.

The following amounts of seed, the garden specialists of the U. S. Department of Agriculture say, are needed to plant approximately 100 feet of row, or enough to supply vegetables for a family of four:

- Beans, Snap, 1 pint.
- Beans, Pole Lima, ½ pint.
- Beans, Bush Lima, ½ to 1 pint.
- Cabbage, early, ½ ounce.
- Carrot, 1 ounce.
- Cauliflower, 1 packet.
- Celery, 1 packet.
- Cucumber, ½ ounce.
- Eggplant, 1 packet.
- Kale or Swiss Chard, ½ ounce.
- Parsley, 1 packet.
- Parsnips, ½ ounce.
- Salsify, 1 ounce.
- Squash, Summer, ½ ounce.
- Squash, Hubbard Type, ½ ounce.

The following vegetables, the specialists say, will undoubtedly be planted in larger amounts than those just mentioned, and the amounts of seed given will be a guide for ordinary requirements. Some families may need more of the various vegetables and others would need less:

- Beet, 4 ounces.
- Cabbage, late, ½ to 1 ounce.
- Corn, sweet, 1 pint.
- Lettuce, 1 ounce.
- Muskmelon, 1 ounce.
- Onion Sets, 2 quarts.
- Peas, Garden, 2 to 4 quarts.
- Radish, 1 to 2 ounces.
- Spinach, ¼ pound in spring and ½ pound in fall.
- Tomatoes, late, ¼ ounce.
- Watermelon, 1 ounce.
- Turnips, ¼ pound.

The string beans, bush lima beans, sweet corn, lettuce, peas, and radishes, will not all be planted at one time, but successive plantings two to three weeks apart will be made so as to have a fresh supply throughout the season.

Of early Irish potatoes 1 peck to ½ bushel will be required, and of late potatoes ½ bushel to 1 bushel, or more, depending upon the amount of ground available for this purpose. If possible, enough Irish potatoes should be grown to last throughout the winter.

In the event that the family wishes to raise vegetables to supply current needs and also a surplus for canning, the amounts indicated above should be considerably increased.

The U. S. Department of Agriculture, Washington, D. C., will supply bulletins on application.

The Supreme Tractor for Cultivating

THE

BEAN TrackPULL Six Horse Tractor

Is the Ideal Machine for Cultivating.

Cultivating time is here and every farmer and grower should know about the many advantages of using a Bean TrackPULL Tractor.

The Bean TrackPULL is very light, weighing only 2875 lbs. It pulls itself over soft soil, and does not sink in nor does it pack the soil.

How It Works

The Bean TrackPULL Tractor is built on a substantial track 12 inches by 32 inches on the ground. The power in the tractor pulls it along its own revolving track. That's why it does not pack the soil—gets long traction—turns easily to right or left—can make a complete turn in a 10 ft. circle, is most economical in operation and a boy can easily work it. When the hot days come your team loafs and you get only an average half-day's work done in 10 hours. The Bean TrackPULL will work day and night if you want it to, and does the work all day long that a six-horse team could do if they worked hard continually.

The Price is Only \$975.00

Bean TrackPULL Tractor construction consists of a 10 H. P. (at belt) Le Roi 4-cylinder vertical type—4-cycle motor. Equipped with Donaldson air clarifier, Bosch ignition, Perflex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, Hyatt roller bearings in track wheel sprocket and track rollers, six New Departure ball bearings in the transmission, running in grease and dust-proof. Gears are steel. No differential or other complicated mechanism.

Making figure 8 around trees and leaving no unfinished work.

Pulling a spring-track cultivator between rows 12½ feet apart.

Prompt Deliveries in April

Our entire output is sold a month in advance and we are working night and day. We are building a large addition to our factory to increase our capacity, so that we will be able to ship tractors that are ordered now, in April.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

STILL TIME TO PULL STUMPS.

[Written for Pacific Rural Press.]

There is still time to pull stumps economically before the ground dries. Stump land is loafer land except for what grass may grow there. At present prices of farm land, our readers cannot afford to own any on which stumps are preventing its use.

The stump land is often the richest on the farm. It has been accumulating humus from forest leaves for ages—plant food drawn from deep in the ground and laid on top.

Hand power, horse power, and engine power stump pullers are on the market, some of which may be had for several days' free trial. The makers of these will furnish information on just how to use them for different kinds of stumps and different soils. Many farmers will prefer mechanical appliances rather than dynamite on account of the high insurance cost for men using the latter, though it is equally effective if skillfully used.

SHAFT BROKE—LACKED GREASE.

[Written for Pacific Rural Press.]

The main drive shaft 2½ inches in diameter in C. S. Lombard Jr.'s tractor broke for lack of grease. The fast turning bearings had been kept well greased, but he had been told that the slow drive-axle wouldn't need much. So he gave the grease cup a turn every two hours. No jack came with the machine and Mr. Lombard was unable to see if there was

any wear in the bearings until the shaft broke. Then he jacked it up and found the bearings very much worn and the shaft bright. Now he gives the grease cup a full turn every hour. Grease is cheaper than steel. He believes that tractor users ought to examine their main bearings thoroughly every month or so, and tighten them. Otherwise a lot of time will be lost putting in repairs. Mr. Lombard is using his tractor on 50 acres of oranges and 20 of alfalfa in San Bernardino county.

ORCHARD ABOVE PUMP.

To the Editor: What is the best and cheapest method of pumping water to 1½ acres of orchard above the ditch? I have a 2 h.p. gas engine. What sized pump would that drive? The water would have to be lifted 2½ feet from an open ditch which runs through the center of the high place. Would plunger or centrifugal be best, taking prices into consideration?—J. C., Denair.

Your two h.p. engine would lift 800 gallons per minute for your purpose with a centrifugal pump. The difference between cost of the two types is so slight that the time saved with a centrifugal would soon pay its cost. But for 1½ acres, there is scarce need of a greater pump capacity than 250 gallons per minute. This would put three inches' depth of water over your 1½ acres in eight hours.

GROUND ALFALFA BALANCES FEED.

[Written for Pacific Rural Press.]

It will pay every dairyman to grind up every bit of alfalfa hay his cows eat; and 25 to 33½ per cent of alfalfa meal soaked 12 hours and mixed with the grain makes hog fattening cheaper than feeding grain alone, according to J. E. Beerney of Kings county. He uses a No. 9 alfalfa-stover cutter and grain grinder combined, to make his feed more available to the animals. The mill cuts alfalfa into 1 inch long, and drops it into the grain hopper where it is ground about as fine as coarse meal at the rate of 40 bags per hour.

AUTO JOTTINGS.

- Don't speed.
- Don't run on the battery.
- Don't turn corners too rapidly.
- Don't let the clutch in suddenly.
- Don't advance the spark too quickly.
- Don't race the motor when shifting gears.
- Don't use dirty water in your radiator.
- Don't abuse the brakes. Apply them gradually.
- Don't shift into or out of reverse when the car is moving.
- Don't drive fast on wet pavements—the car is liable to skid.
- Don't run the car if you detect some unusual sound—investigate.
- Don't start on a trip without a full gasoline tank and plenty of oil.
- Don't pass street cars while they are taking on or discharging passengers.

REDUCE FUEL COSTS ONE-HALF

KILLEFER EFFICIENCY

KILLEFER QUALITY

Beet Cultivator

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the strongest and best made Beet Cultivator for sale on the Pacific Coast.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave.

Los Angeles, Cal.

DEEP WELL TURBINES

No valves to pack or plunger to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal, and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

What About Your Irrigation Pipe?

Owing to conditions existing in the iron market and also to weather conditions, we suggest you order early

AMES IRVIN IRRIGATION PIPE

We have a complete stock, and can make immediate delivery. AMES IRVIN PIPE is solid and strong, with no holes in steel. Each sheet is edged-locked together, and then set down under 3500 pounds pressure. Such seams will not break or leak.

Send for booklet giving complete information about Irrigation Pipe and its construction. Get it today.

AMES IRVIN COMPANY

8th and Irwin Street,

San Francisco

Signal and pass to the left of another vehicle going in the same direction.

Upon signal from a vehicle in the rear, pull to the right and allow it to pass.

Keep to the right and pass to the right of vehicles going in the opposite direction.

Don't make a practice of running in the car tracks. It is a sure way to ruin a tire.

Don't use dirty gasoline. It is well to strain all the gasoline you put in the tank.

Don't use the brakes too much. Slow down the car by means of the clutch and throttle.

Jack the machine up for winter and save the price of a set of new tires in the spring.

Never stop your machine at the corners when in cities. Never stop in front of a fire plug.

Don't get water into your carburetor or on the magneto gear when washing your car.

Never leave your machine standing in the street with the motor running when there is no one in it.

Tire chains are a safety device of undoubted value, yet remember that they lessen considerably the service life of the tire.

In turning corners to the right, turn as near to the right side of the road or street as possible; in turning to the left, always pass the center of the road before turning.

When a tire is changed, if the dust cap and valve washer are slipped between inner tube and casing, a blow-out is sure to result at the point where washer and cap lay on the tire.

POWER NOTES.

Marketing hogs by auto truck from Livermore Valley reduced the shrinkage to only 15 pounds for the whole load hauled to Oakland recently by H. Wente as reported in the Livermore Herald.

A three-horse power spray rig using distillate and tobacco extract emulsion at 225 pounds is "getting" the thrips in the J. C. Jones orchard in Contra Costa county at the rate of 10 acres per day according to Mgr. R. F. Jackson.

An auto truck is being used by Supervisor Ross of Mendocino county instead of six horses to round up and level the roads. It seems to enjoy the work, says the Mendocino Beacon.

Get this valuable free book

Do you own an orchard? Or are you going to plant one?

If so, you will find information worth many dollars to you in the Giant TREE BOOK, "Better Orchard Tillage."

This book is written especially for Pacific Coast fruit growers.

It tells how to have thriftier, faster-growing, earlier-bearing trees by planting in beds blasted with

GIANT FARM POWDERS

STUMPING - AGRICULTURAL

It tells also how to secure better drainage and increased moisture-storage capacity in established orchards, and how to get larger yields and save money on fertilizers.

The book contains illustrations that show exactly how to do the work. There are chapters on preparing the beds for trees and increasing the plant food by deep tillage. Also there are directions for blasting in established orchards or groves, and interesting letters from many prominent fruit growers.

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

FOR great power, working flexibility, reliability and durability, the 15-35 Model E Sandusky Tractor stands in a class by itself.

Proof of this is found in the increasing number of farmers who are its enthusiastic endorsers because of results obtained on their farms, and in the growing list of imitators who follow its progress.

Reason for this admitted superiority exists in the engineering skill that designed this tractor, the excellent workmanship that goes into it, and the highest-class materials used in its construction. The completed tractor was tried out by exhaustive tests before it was offered the public, and the result of these tests has been emphatically endorsed by hundreds of users.

Fifteen horse power guaranteed at the drawbar, with $33\frac{1}{3}$ percent reserve; thirty-five at the belt. Direct drive on all heavy duty work, and ease of handling, with its reliability, make it the ideal tractor.

You get *tractor certainty* when you buy a Sandusky, because service and long life are built into it in the first place, and because all the experimental work is done at our expense before you are offered the machine.

And you buy *with certainty* as well. You must

try our tractor on your own farm, doing your own work, before it is yours, and it must convince you by actual service that it is adapted to your needs.

The Sandusky Tractor on your farm will economically do your plowing at the right season; do your harvesting when your crops are ready, disc, harrow, thresh, haul, fill silos, crush rock, shred fodder, saw wood, build roads and do a hundred other tasks that keep it busy for you and your neighbors all the year round, to your great profit and satisfaction.

BOOKE-136 FREE.—A 40-page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the 15-35 Model E Sandusky Tractor. A copy will be mailed you upon request. Be sure to ask for Book E-136

THE DAUCH MFG. COMPANY

A NEW PLAN—FREE SERVICE. We announce an entirely new departure in tractor selling. A coupon book good for 200 hours of service goes with every Model E; a similar book for 100 hours with every Model J. This means expert advice and help without charge when you want it. See catalog for details.

10-20 Model J
BURNS KEROSENE

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

WHERE the volcano of power presented in our 15-35 Model E is not needed, but where a sturdy, efficient and durable tractor is sought, the 10-20 Model J Sandusky solves the problem.

It isn't because it is lower priced, but because, for the smaller farm, the Model J, pound for pound, is every bit as good a tractor as the Model E.

Highly trained engineers have spent years of study on it; skilled workmen have carefully wrought the best materials into the engineers' designs, and *three years* of constant field development, of careful tests, of hard work under adverse conditions, have thoroughly demonstrated the practicability, the economy and the absolute reliability of the Model J.

Hence it is guaranteed as a profitable servant on the farm, to do your plowing, harrowing, discing, harvesting, threshing, silo filling, fodder shredding, wood sawing, road building, hauling, etc. We show you on your own farm that it will do your work---that it is adapted to your needs---that it is capable, efficient and economical.

Behind it we put a guarantee that means much; the faith of our organization and the standing we have

built up by years of honest dealing. All of these say to you:

"Buy the Model J Sandusky Tractor. It will serve you faithfully, make your farm work more productive, decrease your farm expenses and ease your labor. And it does not cost any more than the good horses it displaces, while its working capacity is so much greater that you will actually make money with it."

BOOK J-135 FREE.—Describes the unique principles of design, construction and performance of this smaller machine. Also gives details of our "Try It Before You Buy" sales policy, and our broad, binding guarantee. Be sure to ask for Book J-135

Dak.; Fargo, N. Dak.; Sioux City, Iowa; Lincoln Nebr.; Wichita, Kans.; Dallas, Texas; Leesburg, Fla.; Los Angeles, Cal.; Sacramento, Cal.

The Origin and Present Status of the Shorthorn.

[Written for Pacific Rural Press.]

THE student of Shorthorn history and pedigrees is faced with a greater preponderance of strange names and occurrences than in the study of most other breeds of livestock, for the reason that its early and much of its latter-day history was made in foreign countries.

"Teeswater" and "Durham" were the terms first applied to these cattle, because they originated in the Tees river valley in the shire of Durham, England. While both these names have long since been discarded officially, there are still many farmers who know them as "Durhams." Their original appearance is explained by one writer as being "White with brown ears and muzzles, supposed to be a cross between cattle brought from the continent of Europe and the native white cattle of Europe." Being a cross breed, mating of red to red or white to white for a number of crosses invariably deteriorates the size and quality, while a perpetuation of these characters is maintained when red is mated with white or vice versa, the result usually being a roan. To this admixture of colors the breed owes the name "The Red, White and Roan."

Range beef growers early formed a preference for the red Shorthorn, forcing breeders who depended upon their trade to cater to this color, which had a disastrous effect upon the breed later. While this has now been largely overcome, it is not unusual to see range cattle growers mistake white Shorthorns for some new breed.

The Bates Theory.

So far as present-day interest is concerned, no mention need be made of breeders or individual animals till 1800, when Thomas Bates of Northumberland, England, purchased his first Shorthorns. He is described as having been a close follower of pedigree on the theory that animals bred along certain lines almost invariably produce desired results when mated. He believed in the dual-purpose Shorthorn, developing the milking as well as beef-making qualities, scoring perhaps his most spectacular success in New York in 1873, when a cow of his Duchess tribe sold for \$40,600.

Inbreeding, with only occasional outcrosses, is characterized by some as being a main fault of Bates. Imitators sprang up in both America and England, after his Duchess family was dispersed, but by injudicious management this family finally became extinct. Other notable tribes were originated by Bates.

The Booth Brothers.

Contemporaries of Bates were the Booth Brothers, whose special aim was to produce an early maturing animal, chiefly of worth for beef-making. While some Booth cows showed dairy capacity they soon "dried off" and put on flesh rapidly. A dash of this Booth breeding was given most American herds with the idea of increasing the size of the Bates cattle, and is still found in most herds of long standing. The Booths secured many of their best cattle from the Blossom, Bright Eyes, Isabella and Booth Red Rose tribes.

The Booth-bred cattle, like those of Thomas Bates, suffered from speculative "trafficking" in pedigrees by a mercenary class of men who had little regard for the breed. As a result many of the "warm-blooded" ones, fashionably so-called, went to rich fanciers instead of to constructive breeders. The result of this was the decline of the Shorthorn (about 1878) in favor of Herefords and Aberdeen Angus, whose breeders had realized the necessity of feeding capacity and substance rather than stylish breeding. Favor for these two breeds was particularly strong among west-

tern feeders and stock-yard buyers, who, after all, determine a breed's worth.

Scotch Cattle.

The next great step in Shorthorn development came from this range demand for something more than a pedigree, and, strange enough, it was the period during which another British Isle reputation was made. This time fortune reached out into the mountains of Scotland, where a settlement of Scotchmen, mostly tenants, had been developing Shorthorn cattle as beef and

ionable blood lines. Thus began world-wide recognition of the Scotch Shorthorn for beef-making purposes.

Alvin H. Sanders ("History of Short-Horn Cattle") characterizes the Cruickshank ideal as having a broad, full chest, wide back and deep ribs, demanding first of all "a good middle" on the theory that good constitution and digestive capacity present their manifestations in body rather than in the extremities.

Scotch Shorthorns in the United States.

Importation of these cattle to America began in 1857, when some thirty head were brought from the Cruickshank establishment. They did not meet with popular approval because of the Bates craze, which was run at its height, but when the popularity of the breed began to wane it was these Scotch cattle that came to the rescue. Canadians had already begun to appreciate them and considerable importing was done there also. Show ring success as well as approval from beef-growers quickly placed these thick-meated, short-legged Scotch types in an enviable position from which they never receded, and to which the present popularity of the breed is largely due.

During the close of the nineteenth century heavy importations were made and Bates and Booth breeding was superseded by Cruickshank blood as fast as liquidation was possible. Notable among these importations was the cow Bapton Pearl, imported in 1900 from England.

She only produced one calf after arriving in this country, but that one calf, Whitehall Sultan, proved one of the greatest sires of the breed. He sired among other great bulls, Avondale, Whitehall Marshall and Sultan Stamp, all great show winners and sires, besides a great number of animals of lesser reputation. His progeny's tribes are more generally used on American herds than any other breeding. Others that have done much for the breed are notably Choice Goods, Cumberlands, Archers and Xingmasters.

Whether we are again nearing the danger line with Shorthorns, by placing a premium on "straight" Scotch breeding over what are now termed the "commoner sorts," is an open question.

Both show ring and auction sale emphasize the superior popularity of the low, thick-set Shorthorn, the "plainer sorts" finding it impossible to compete in the sales ring with their more aristocratically bred barn mates. Time alone can tell which of the two will ultimately win out.

California's Experience with Shorthorns.

California, like other States, had its Shorthorn ups and downs. Cattle strong in the blood of both the Bates and Booth tribes formed the basis of the early-day herds, although it has been gradually reduced by top crosses of straight Scotch-bred herd sires. It is significant in this connection that those herds which have maintained a foremost place have been headed by straight Scotch-bred bulls. Notable among these are the Glide, Gibson, and Howard (now part of Paicines) herds. The Red Knight, Lancasters, Choice Goods and Archer families have played no inconsequential part in adding to the merit of these herds and have found favor with range users. That favor leans toward Scotch breeding with more recently established herds is shown by the Avondale and Cumberland bulls in the Hawkins band of cows, the descendants of Ringmaster on the Hopland herd, the prevalence of Choice Goods and other straight Scotch in the Ormondale foundation, and the Scotch foundation in the Paicines, Barco and Carruthers herds.

First Prize 2-year-old, Senior Champion and Reserve G. C. Cow, Cal. State Fair, 1916. Sired by Musicmaster, by Ringmaster, and traces to Choice Goods on dam's side. Red Heifer, owned by A. W. Foster.

Barco Duchess, G. Ch. Shorthorn Heifer. Sacramento, 1916. Barco Ranch, Hollister.

Count Glory, G. Ch. State Fair 1916. Traces back to Avondale. Owned by W. M. Carruthers.

milk producers, regardless of color fads or fastidious pedigrees. Individual merit was their motto, and while they were frowned on by adherents of Bates, who termed their cattle "cold blooded," they were unmoved by outside criticism. These mountain breeders were content with profitable cattle, till one of their number, Amos Cruickshank, invaded the show yard, competing with English herds of the then more fash-

Raising the Price of Market Milk.

[Written for Pacific Rural Press.]

By producing clean milk from healthy cows and letting their customers know it, Bohnett Bros. raised their prices to consumers and held their trade.

Although consumers are ever demanding better sanitation on market milk dairies, the large majority of them are unwilling to pay anything additional for such milk. This is particularly true in smaller towns and cities where the price per quart of milk per month is usually 20 to 35 per cent less than in larger cities.

That a good frank discussion of clean milk, its cost of production, and why the producer should receive more money for it may often aid the producer supplying milk to country towns in raising his prices is evidenced by the experience of Bohnett Bros., who supply milk to the retail trade of Campbell, Santa Clara county.

While their herd is comparatively small, they have taken every precaution toward the production of clean milk, succeeding well, as indicated by the fact that their bacteria count is held around the 10,000 per c.c. mark. This of course entailed additional expense for labor, equipment, supplies, etc., but they were selling their product for \$2.50 a quart a month, the same price as was received by less careful competitors.

Realizing that they must increase the price and at the same time retain their trade, they issued a neat circular which they were careful to place in the hands of every customer. The logic of their argument as set forth in the following not only allowed them to raise their prices, but held their trade also, only two customers quitting because of the higher prices.

Did you ever stop to consider the difference between GOOD MILK and just milk? Not necessarily only the difference in price, but also the difference in real value.

Is it worth anything to you to know when you get a quart of milk that it has not been contaminated by dirty cow hair, foul air from the stable, or disease-carrying flies?

Is it worth anything to feel assured that when baby takes a drink of milk, she will not contract that dreaded disease, tuberculosis, from some tubercular cow?

Is it worth anything to you to know that when little George or Helen takes a drink of milk that it is out of a bottle that has been thoroughly sterilized since Mr. Jones, who has had diphtheria, has had it in his home?

Is it worth anything to you to know when you put a bottle of milk on the table that Fido or Fluffy has not already tasted the cream on top that has leaped through around the cap?

If these suggestions do not interest you, burn this paper and phone us to stop your milk today. But if they do interest you, notice the methods we use.

(1) Our cows are kept in corrals where the manure is never allowed to accumulate for more than 48 hours and are furnished plenty of clean bedding in winter that they may rest contentedly under shelter between milkings.

(2) Our herd is tuberculin-tested every six months that we may be sure we are not endangering any innocent baby's health by sending out milk from tubercular cows.

(3) The hind quarters and udders of our cows are kept clipped so there will be no chance for the accumulation of manure and other foul mat-

ter on their flanks, etc.

(4) In preparing the cows for milking we first go over them with a wet sponge to remove the dust and loose hair, then we thoroughly wash and dry the udder with a clean cloth.

(5) We then milk with a Mechanical Milker which draws the milk directly from the udder into a closed pail, giving no chance for contamination from flies, dust, etc.

(6) Each cow's milk is carried directly to the milk house and run over the cooler, which drops the temperature to a low degree, thus checking the bacteria growth.

(7) As soon as cooled the milk is bottled with a patent bottler and immediately sealed with San Lac seals, which prevent any possible contamination of the milk from the time it leaves our milk house till it is opened on your table.

(8) Last but not least, is the fact that all of our bottles and utensils are thoroughly washed and rinsed in hot water and then exposed to live steam under pressure for at least 20 minutes before each filling.

Now, with an idea of the amount of labor and expensive equipment it takes to produce our milk, please take into consideration the fact that all the food stuffs we use for our cattle have gone up 20 to 100 per cent the last year (when we have figures to show that we barely made laborers' wages for the time we put in).

It is not our aim to make the dairy a get-rich-quick proposition, but we do maintain that we are entitled to a fair compensation for our labor. By actual accounts, which we have kept, we find the feed expense of the dairy business just a trifle more than half of the total cost of production and marketing milk.

With these facts before you can you see any logical reason why we should not receive the following prices for our milk?

One pint per day, one delivery, \$1.50 per month.

One quart per day, one delivery, \$3.00 per month.

One quart per day, two deliveries, \$3.25 per month.

Three pints per day, one delivery, \$4.25 per month.

Three pints per day, two deliveries, \$4.50 per month.

Two quarts per day, one delivery, \$5.50 per month.

Two quarts per day, two deliveries, \$6.00 per month.

Three quarts per day, one delivery, \$8.00 per month.

Three quarts per day, two deliveries, \$8.50 per month.

Special prices on larger amounts.

Many other known facts regarding the value of pure whole milk as a foodstuff were then set forth in the circular under the heading, "A Few More Interesting Facts About Milk," and a paragraph was inserted stating that the new prices would go into effect on a certain date.

SQUEEZER FOR CALF BRANDING.

[Written for Pacific Rural Press.]

Instead of wearing out horses as well as men at branding time on the Stanford University's ranch near Durham, Butte county, a home-made calf squeezer is used that makes possible the branding, marking, and castrating of 300 calves a day with the help of about four men.

This squeezer is made as a continuation of the chute through which the calves are driven from the corral. The frame work of the squeezer is made with 2x6 plank, set upright in a slanting position. Slats made of two-by-three's are nailed onto the frame-work, giving the

sharp turn; thus the cream is extracted more thoroughly. This bowl is also remarkably long—milk travels further while the intense skimming force is working on it. But its greatest feature is that it will skim clean regardless of how fast or slow you turn it.

SHARPLES SUCTION-FEED CREAM SEPARATOR

is the *only* separator that:

- skims clean at widely-varying speeds
- gives the same thickness cream regardless of speed changes
- skims your milk quicker when you turn faster
- has only *one* piece in the bowl—no discs, easy to clean
- has knee-low supply tank and once-a-month oiling

Sharples varies the feed in direct proportion to the separating force, and thus insures clean skimming at all speeds—needs no watching. It's positive protection against cream loss. All fixed-feed separators lose considerable cream when turned below speed—and 19 out of 20 people do turn too slow. A Sharples will average 5% more cream than any other separator just for this reason.

Write for catalog today; address Department 31.

The Sharples Separator Co.

West Chester Pa.

Sharples Milkers—used on over 300,000 cows daily

Branches: Chicago San Francisco Toronto

frame's sides a fence-like appearance.

The frame-work of both sides is hinged at the bottom so that when the calf is in a standing position one side may be pushed in by a workman and the calf is securely held in an upright position.

The entire device is hinged on one side to an old wagon axle which allows it to be pushed still further over so that the calf is lying on its side at a height of about two feet from the ground. The entire device is operated in a similar manner to the veterinarian's operating table except that it holds the calf in position by squeezing instead of with ropes and chains. Castrating, marking, and branding are all done at the same time, one man attending to each task as the calf lies on the table or rack. Usually this work is done about the first of May when the round-up is held.

The recent Automobile Show at San Francisco has led to the decision to hold a motor truck show at Exposition Auditorium April 3 to 7. About a dozen firms have signed up

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Coulson Poultry & Stock Food Co., Inc., Petaluma.

to show about 50 machines. This is the opportunity for our readers to see them all together.

During the past three years the State Motor Vehicle Dept. has turned over \$4,977,012.02 to the State and counties for use on the roads.

Cow Testing at Minimum Cost.

[Written for Pacific Rural Press.]

The Bodega Cow Testing Ass'n boasts of having the lowest charge per cow of any association in the State, their charge straight through, regardless of the size of herd, being \$0.85 per cow per year during the time the association has been operating.

There seem to be two reasons for the successful operation of the association on this basis: First, the herds are large as a rule, the average in the association containing 45 cows; and second, all of the members are good pay, avoiding the bad bills that must be paid by those who meet their obligations promptly.

But this rate is not set as a flat guarantee to prospective members, for the association is run on an assessment basis. These assessments are made as needed to cover the entire cost of the testing; and may be made either monthly or less often as required. In this way there is little surplus in the treasury at any time; but as the officers of the association are thoroughly reliable, the credit of the association is good at all times.

The association was started about two and a half years ago with 1,100 cows. Necessary equipment was bought for the tester, they furnished him transportation from one ranch to the other, and paid him a monthly wage of \$65 and found.

The second year testing was not done under the supervision of the association, partly because some dairymen had the erroneous idea that one year's work was sufficient to tell the good cows from the bad, and partly because when the second

year was to have started, the leaders in the association were unable to devote time to "rounding them up," as one man expressed it.

But some of the members saw the need of continual testing and had their testing done regularly each month by a man in the community who understood the work, using the equipment of the association for such work.

By the end of the second year these few dairymen were determined to re-organize the association; and after a few days' work 1,100 cows were again signed up, this time the tester receiving the same monthly salary but furnishing his own rig.

According to J. R. Gallagher, who is president of the association, there is a disposition on the part of many members to pay too little attention to their record books. He relates an instance on his own ranch where a workman told him to be sure and cull out a certain cow "because she was giving such a small amount of milk."

Before following the advice Mr. Gallagher consulted his book and found that the cow had produced 265 pounds of fat during her last lactation period. The workman had forgotten that while she was a light milker she was persistent, and that her test was high. That is exactly the reason that some members of cow testing associations do not appreciate cow testing records, to Mr. Gallagher's mind; they do not study their books; and therefore know very little more about their cows than if they had no such records.

Milo Silage Reduced Milk.

[Written for Pacific Rural Press.]

Many times the breeder of pure-bred dairy cattle who is doing official testing discovers facts about feeds and feeding which do not coincide with popular belief on the same subject, such an example is shown by the experience of the J. S. Gibson Co., Holstein breeders of Colusa county, in regard to silage.

In previous years Indian corn silage had been fed to both young and old cattle with excellent results, but owing to the fact that milo maize could be grown more economically, only one of the three silos on the place was filled with Indian corn last fall, milo being used in the other two.

When feeding of the milo was started the young cattle seemed to relish it and also began putting on flesh, a satisfying condition where official testing is to follow freshening. The fresh cows also cleaned up the milo and kept in

fine condition, but a falling off of about 5 per cent in their milk flow was soon noticed, and was not overcome till the ration was changed.

Thinking that the difficulty might be overcome with the heifers and with dry cows, the milo silage ration was continued with them. Not only did they put on fat, but it seemed to be a soft fat as well, something every experienced feeder likes to see his cows possess before freshening, on the theory that soft fat milks off while hard fat does not.

But despite a change from the milo silage after freshening, none of the cows did as well as was expected of them, it being impossible to milk the fat off.

This led Gion Gibson, manager of the herd, to believe that milo silage is not as good a feed for dairy cows as Indian corn silage, at least when it produces as much as 30 sacks of grain to the acre, as his did last year.

Alfalfa Silage or Meal?

To the Editor: Is silage or alfalfa meal best to feed milk cows? I have no land on which to raise corn for silage and would have to fill the silo with alfalfa. I cut three or four crops of alfalfa per season. In partnership with a neighbor, I own a feed cutter and silo filler; and for \$50 can get a grinder for alfalfa meal. Would have some to sell and then use rolled barley and some rough feed. I thought this better and less expensive than alfalfa hay and alfalfa silage.—R. M. C., Mid-

dletown.

The only advantage of siloing alfalfa is to get succulence for dry periods, or to save a weedy crop or one that would not cure well on account of weather. Considerable care is necessary to make good silage from alfalfa. Grinding it to meal avoids waste of alfalfa hay in feeding; and barley will balance it in the ration.

DE LAVAL

The First, the Best Known
and the Greatest

CREAM SEPARATOR

Better Now Than Ever Before

THE first practical continuous cream separator, the De Laval, has easily maintained its original success and leadership for nearly forty years. Step by step, year after year, by one improvement after another, the De Laval has led in every single step of cream separator development and improvement.

The first belt driven, the first steam turbine driven, the first of every kind of hand turnable, the first disc bowl, the first blade bowl, the first bottom or suction feed, the first split-wing feed, the first feed-through-the-discs, the first self-centering bowl, the first automatically oiled—all these and a hundred other features of separator development and improvement have been conceived by De Laval inventors and perfected by the De Laval Company, most of them to be cast aside for something still better in the ever onward advance of De Laval construction.

The New 1917 De Laval

And now, in the De Laval machines for 1917, a number of new and still further improvements have been made, which make the De Laval machines of today much better in many respects than they have ever been before.

Their capacities are greater per dollar of cost; they skim cleaner under the more difficult conditions of separator use; they are equipped with the most improved speed regulator, thus insuring the proper speed necessary for complete separation; they are even better lubricated, and the bowl construction is even more sanitary than ever.

In other words, superior as the De Laval machines have always been to all would-be competitors and utilizers of abandoned De Laval features, the De Laval machines of 1917 are improved and superior in every way to all previous types and models of De Laval construction.

All these improvements and new features are described and explained in the new 1917 De Laval catalog now ready for mailing, but some of them are difficult to describe and make fully understood by words.

Be Sure to See a New De Laval

The new De Laval machines themselves best explain their new and superior features, and their use does this more completely and convincingly than even an examination of them. Every local agent is glad to afford opportunity for examination, and better still, for home test of a new De Laval machine.

But the demand for the new machines is a month ahead of the possible supply under the present difficult conditions of manufacture and freight distribution. More De Laval machines by half have been made in 1917 than ever before, but the De Laval Works is now ten thousand machines behind actual orders, and the demand is ever increasing.

Hence, the importance of securing a machine quickly if your local dealer happens to have one, and of ordering well ahead if he does not. And likewise, the importance of waiting patiently a little for a machine if need be.

A new De Laval catalog will be gladly sent on request, and if you don't know your nearest local agent please simply address the nearest De Laval main office as below.

DAIRYING.

Livermore farmers recently debated at a Farm Bureau meeting whether it would pay to keep a cow.

The feeding of powdered milk to cows on test is not allowable under a recent ruling of Supt. M. H. Gardner of the Holstein Advanced Register.

A. W. Morris Sons of Woodland report Aagie Acme of Riverside 2nd's 120-day record of 529.34 pounds butter and 10,424.5 pounds milk. She is expected to exceed 100 pounds fat in March.

The Holstein record for fat production in 30 days in the senior two-year class has been broken by Al-lamuchy Korndyke Rose, owned in New Jersey. The record is 2242 pounds milk containing 97.22 pounds fat.

Of the 102 entries of cows and heifers in the Ayrshire Advanced Registry during the quarter ending Mar. 15, 1917, the average production was 10,587 pounds milk and 420.87 pounds fat. The average test was 3.98. This is an advance in both fat and milk.

S. W. Cheyney of the Rio Seco ranch near Chico is putting up a cement "stave" silo. The "staves" are 10 inches wide, 30 inches high, and 2½ inches thick. They are set inside of hoops and pulled tight. Then three or four coats of special cement wash are applied. This is a new type of silo in California.

The Farmers' Protective League is against the bill which provides for branding of all reactors to the tuberculin test, because "neither dairyman nor butcher would buy such an animal." Evidently an unrestricted sale of tubercular animals to ignorant buyers is desired. However, the League stands for remuneration to owners for destruction of tubercular cattle.

BEEF CATTLE.

Three cars of corral-fed steers were recently sold at Porterville to a Los Angeles packer at \$10 per cwt.

The Hopland Stock Farm reports the sale of three registered Shorthorn bulls to the Wm. McGrath Co. of Santa Cruz county. The latter company will use them on their range herd of beef cattle.

A liberal purchaser at the foremost Shorthorn auction sales in the East during the past month has been T. T. Miller of Los Angeles, who is establishing a purebred herd on his ranch in Imperial county.

Feed in the mountains of San Benito county is reported as being scarce but of good quality, the heavy and continual frosts having held back most of the grasses. Alfalfa is said to be short and wild oats are scarce.

T. S. Glide is rounding out a fine lot of young Shorthorns this spring, having a notably fine collection of young heifers and bulls. The bull Count Amaranth, which he purchased in Oregon last winter, is doing nicely and holds out great promise for the future.

The Elder Creek Ranch of Tehama county has just received an importation of registered Shorthorns from Middle Western States. Included in the lot are 12 registered heifers coming three years old and eight purebred bulls. All but one of the bulls will be used on the band of high-grade range cows which are maintained on the ranch, the other one being reserved for the purebred cows.

SWINE.

The Tulare County Duroc Jersey Hog Breeders' Ass'n has been formed with the following officers: Allen Thompson of Farmersville, presi-

dent; J. L. Dickinson of Visalia, vice president; and F. L. Daly of Visalia, secretary.

C. B. Cunningham, president of the California Swine Breeders' Association, will give a Chester White pig, valued at \$50, for the best exhibit of Chester Whites at the Third Annual Butte County Spring Exposition to be held in Chico May 21 to 26, inclusive.

Dr. T. B. Spalding has made sales as follows: boar to R. Scott, Selma; sow and pigs to L. E. Alderson, Denair; four sow pigs to Hughson Boys' Club; boar to Mrs. Ella Maze, Modesto; boar to A. J. Williams, Pilot Hill; boar to A. A. Channell, Fresno; and two sows with pigs to Geo. A. Wingert, Turlock.

R. H. Whitten of Los Angeles has recently bought the three-year Poland China boar Big Long Jumbo in Nebraska for \$500. This boar has weighed 1050 pounds. His sire weighed 1050 and his dam 920 pounds. Gilts sired by this boar recently averaged \$175 and sows bred to him averaged \$250. This gives Mr. Whitten five herd boars.

GIBSON HOLSTEINS BEING DEVELOPED.

Ever since the Holstein cow Winnie Korndyke Cornucopia De Kol broke the Pacific Coast record for yearly production of butterfat and fell just short of breaking the world's record for the production of milk, Holstein circles have had their eyes on the herd owned by the J. S. Gibson Co. at Williams, Colusa county, realizing that some of the best foundation cattle to be found have been assembled by Mr. Gibson, manager of the company.

While no spectacular records have been made during the winter months, a number of creditable seven-day records have been made and 5 cows are on yearly test.

Among the latter are six heifers, sired by the company's herd sire Prince Alcartra Korndyke, a son of Tilly Alcartra; and it will be gratifying to those interested in this breeding to learn that these heifers averaged 18 pounds of butter in their seven-day tests and are proving period.

New test-and calf-barns are among the recent improvements on the ranch; and with these advantages and the class of cattle being bred, it may be expected that the Gibson Co. will be an influencing factor in the future of the Holstein breed on the Coast.

SAN LUIS OBISPO DAIRYMEN BUY CARLOAD OF HOLSTEINS.

A carload of 11 registered Holstein bulls 8 to 14 months old, and 15 registered heifers, 13 of which are in calf to A. R. O. bulls, were recently bought by President A. B. Spooner of the San Luis Obispo County Dairymen's Ass'n for the following members: Joseph Dalesi, Berros; W. D. Wimmer, Pozo; Peter Tognazzini, Cayucos; George Ross, Edna; C. S. Pike, Paso Robles; and Karl Steiner, James McMillan, John Walters, Joe Barlogio, Ben Patchett, H. M. Warden, Otto Sinsheimer, Manuel Garcia, M. D. Tognazzini, Valerio Tognazzini, A. B. Spooner & Sons, of San Luis Obispo. The animals carry some of the best breeding in the country and all the heifers are out of A. R. O. dams. Mr. Spooner has a son of Prince Gelsche Walker purchased a year ago from Morris & Sons, which he will use on the three heifers which he purchased.

STATE DAIRY COW COMPETITION

On this March 27, there comes to us by special delivery a complete report of the records made in the State Dairy Cow Competition last Feb-

ruary. Sometimes news gets old. We regard these reports as of great interest to our readers, but we can mention only a few high points this time. Total entries to date, 229 cows. Average production for February (166 cows), 1300.3 pounds milk, 49.081 pounds butterfat. Range 94.4-21.6 pounds. One hundred and thirty cows produced over 40 pounds fat, as against 75 in January and 57 in December. This is encouraging.

K. W. Abbott, proprietor of Moorland Farm at Milpitas, informs us that his Holstein cow Mabel Haskins Colantha Girl Jr. is entered in the California State Dairy Cow Competition.

The Lewis Co. have recently com-

pleted a number of seven-day tests with their registered Holsteins near Agnews, Santa Clara county.

PUREBRED HEREFORD SALE.

The first public sale of registered Hereford cattle to be held in California will take place at Mayfield on the D. O. Lively Stock Farm May 3. This offering is made up of especially selected, richly bred, Western raised Herefords. The predominance of females in the sale gives an opportunity for picking out animals with which to start a purebred herd. Everyone interested in the cattle industry is invited to attend.

University Farm Picnic and Show Day will be April 28.

Borrow Money at 6% and make 30% with an

Ideal Green Feed Silo

Now is the time to place your order for an Ideal Green Feed Silo. Put that first crop of alfalfa into it. It won't make good hay, but the alfalfa, foxtail and weeds will make excellent silage. Have silage to feed this summer when green feed is gone. You can thus increase your milk profits and reduce feeding costs during the coming dry season. The silo will be empty in time to fill with corn this fall for winter feeding.

Refrigerator Type Doors; Air and Water Tight Foundation Joint; Proper Design; Selected Materials and Painsstaking Workmanship make the Ideal Green Feed Silo a Safe, Profitable Investment for the Dairyman or Stock Raiser. Send for Catalog.

Acme Feed Cutter and Silo Filler

Mounted on Truck
All Steel Frame
Positively Safety Device

Low Feed Table
Automatic Feeding Device
Reversible Feed Rollers

Rigid Construction
Light Running
Easy to Handle

EQUIPPED WITH ALFALFA MEAL MAKING ATTACHMENT.

An excellent quality of alfalfa meal can be produced on this machine at a cost not exceeding half of that for baling.

Save \$3.00 Per Ton on Dry Feed.

Run it through an Acme Feed Cutter so that the coarse hay as well as the fine will be entirely consumed by your cattle.

Catalog on request.
Built in Seven Sizes.

De Laval Dairy Supply Co.

Everything for the Dairy.

101 DRUMM STREET,

SAN FRANCISCO, CALIF.

Globe A-1 Cottonseed Meal & Nut Cake

45% Protein and Fats

ONE TON COTTONSEED MEAL replaces corn and hay values of \$102.24 at present prices. One feeder obtained equal results by feeding on the basis of 1 LB. OF COTTONSEED MEAL IN PLACE OF 137 lbs. corn, and 1.41 lbs. clover hay.

Analysis value cottonseed meal manure today \$38.63 per ton. Mature Stock fed cottonseed meal will deposit 50 to 90 per cent of this on your land. Oat and corn manure will return only about one-fourth as much to the land as cottonseed meal.

If you wish to make these profits feed A-1 Cottonseed Meal and Bran to dairy cows. Fatten Beef Cattle and Sheep on A-1 Cottonseed Cake. Feed your work Horses and Mules Cottonseed Meal with bran or rolled barley. Poultry—Get our mash formula for Laying Hens. Write for circular. Buy from nearest dealer, or send us his name if not on sale.

D. O. LIVELY STOCK FARM'S

FIRST ANNUAL SALE OF

Registered Hereford Cattle

will be held at Mayfield, California, Thursday, May 3, 1917.

The offering will be made up of sixty-five head—twenty bulls and forty-five females. Among the best Hereford strains represented. All Western bred. A splendid opportunity to start a pure-bred herd. Write for catalogue.

D. O. LIVELY STOCK FARM, INC.,
215 Hobart Bldg., San Francisco

REAL Holstein Quality

If you are in the market for a young bull that will improve the type and production of your herd, let us quote you a son of one of the following proven sires—

SEGIS PONTIAC DE KOL BURKE—Grand Champion State Fair 1916. His sire and dam both Grand Champions. His dams record of 124.5 pounds milk a day average for thirty days is the second highest in the world. And best of all he is transmitting this type and production. His daughters just coming in milk have produced as high as 23 pounds butter in seven days as 2-year-olds.

KING MEAD OF RIVERSIDE—The sire of the present State record cow, Aaggie Acme of Riverside 2d, that has produced in 120 days official test, 529 pounds butter and 10,424 pounds milk. She is his first daughter tested at mature age. They average 4% butterfat.

PRINCE GELSCH WALKER—One of the best bred bulls in the world and whose daughters have broken six or more State records as two and three-year-olds.

A few of their sons from high-record dams now available at moderate prices.

HORSES AND MULES.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building, 525 Market St. San Francisco.

ATTENTION, STOCK MEN! Population increasing, meat decreasing. Greatest rush in years for Government and State land. Free homes. Safe investments without residence. School, State, Indian, Government lands. Now available. You have nine rights now worth \$1,000 each. Booklet and 640 acre Homestead Circular Free. Write Joseph Clark, Sacramento, Cal.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Ground Rice for Hogs and Horses.

There is no gainsaying the fact that rice has gained a lot of adherents among stock men of the Sacramento Valley during the past winter; and especially is this true of hog raisers who have found it a satisfactory substitute for high-priced barley in most instances.

An illustration of this was recently seen on the ranch of J. H. Trainer of Butte county who has been feeding ground paddy rice that he secured for \$1.10 a hundred because it was a trifle smutty and not well filled out.

Early in March he had, for over a month, been feeding his hogs a ration of three parts ground rice, one part rolled barley and skim milk to a pen of market hogs, part of which had gained a pound a day during the entire feeding period. Mr. Trainer believed they were putting on gains fully as fast as any he ever fed, with other feeds.

In feeding it ground and soaked he believes he gets better results than he would if it were fed dry and whole, as the hull is hard and brittle and almost impossible to digest. His practice is to let it soak about

12 hours, using a bucket to dip out of the barrel. He aims to have the bucket about half full of the soaked barley and rice, filling it with skim milk and adding a little skim milk at the trough afterwards.

He feeds three times a day, always being careful that they have a good keen appetite, but never allowing them to become ravenous; as under such circumstances they gulp their food instead of chewing it; and as a result a large part of the food passes through them undigested.

In feeding brood sows Mr. Trainer does not believe in getting them very fat, preferring to keep them in moderate flesh till about a week before farrowing time when he feeds liberally to give them additional strength and a liberal milk flow for the pigs.

But he does not believe that rice need be limited as a feed to hogs only, for he has used it in connection with barley, equal parts of each, in carrying his horses through the winter. To all outward appearances they are in as good physical condition as if fed rolled barley.

Hogs Follow Tubercular Cows.

[Written for Pacific Rural Press.]

How deceiving hogs may be in appearance alone is related by a hog grower we know who recently shipped 42 of his own and a neighbor's hogs to a San Francisco packer.

The hogs were sold with the understanding that the shipper would stand one-half of any tuberculosis condemnations, and secure a bonus of 10 cents a hundred on all hogs that dressed over 77 per cent.

Of the lot 28 head were from the shipper's own ranch while 14 head were from the neighbor's herd. Neither lot had been fed milk, but the neighbor's hogs had run with his family cows that were known to be tubercular.

Following the entire lot through the packing house this is what the shipper saw: Of his own 28 hogs, one brood sow, nine years old, showed tubercular lesions in the glands of her neck but was afterwards passed through when further examined by the government inspectors.

Of his neighbor's 14 head, two sows were condemned outright, also a boar and one other sow were sent to the sterilization vats. This made a total condemnation for the lot of almost 30 per cent, half of which was shouldered by the packer.

While it was a costly experience

to the owner, it pointed out a bad practice in his farming operations which he would not otherwise have known about. As breeding animals are sold from the same herd to farmers all over the State, he will be in a better position to safeguard the interests of his customers in the future.

RICE STUBBLE FOR HOGS.

[Written for Pacific Rural Press.]

That increased pork production in California is certain to result from any increased acreage of rice seems assured from the experience of those who ran hogs on rice stubble during the winter months.

It had been thought by some that the hulls on the rice would do irreparable damage to the hogs' intestines because of their hard, flint-like character, and by others that the hogs might not do well on rice stubble because of the mud and water which results from heavy rains on the already saturated ground. Neither of these theories seem to be borne out in practice.

That hogs will do as well if not better on rice stubble than on other kinds of stubble is the opinion of J. H. Harlan of Yolo county, who pastured a large band of mixed hogs on 75 acres of rice stubble from December 1 till time for spring plowing last season.

Portions of the band were marketed weighing up to 300 pounds each and Mr. Harlan states that they were in as prime condition as any hogs he ever shipped, also that they put on weight faster than when run on barley stubble in previous years.

Skim milk from several thousand cows is reported to have been contracted on the West Side of Merced and Stanislaus counties to be hauled from several stations by eight motor trucks to the central casein factory at Modesto.

THEY ARE RIGHT

RIGHT as producers

RIGHT as breeders

RIGHT as individuals

That sums up the facts concerning the herd of registered Holsteins owned and developed by H. E. Cornwell, Modesto, Cal. But to arrive at the sum total we had to add together the splendid blood that Mr. Cornwell selected for foundation; the careful matings he has made of select animals during the years it has taken him to build the herd up to its present size and quality; the creditable official records made in the herd; the good semi-official yearly records, both of milk and butter; the consistent show ring winnings of members of the herd; and the splendid way in which the herd is breeding on in both form and production.

AND NOW—this good herd, consisting of 11 A. R. O. cows, with records up to 26.50 pounds butter in 7 days; 6 cows with semi-official yearly records up to 707.31 pounds butter; daughters of A. R. O. and yearly record cows; several well bred young bulls; and the great young herd sire **PRINCE HISKE WALKER**, son of Prince Gelsche Walker, will be sold by us at Mr. Cornwell's ranch near Modesto, California, on Thursday, April 19, 1917.

A catalog is being prepared and a copy will be mailed to those requesting it.

HOLSTEIN CATTLE

Tilly Alcantara, a pure-bred Holstein-Friesian, is the most wonderful cow in the world. In 385 consecutive days she produced 30,451.4 pounds of milk, or about 15 tons. In two years she produced 60,728 pounds of milk. She holds the world's milk record for one, two, three and four years. Holstein cows hold all world's records for milk and butterfat production, but the claim of the Holstein breed to the title of the "most profitable dairy breed" is not based on individual tests. It is the great uniformity of high productiveness of Holstein cows everywhere that makes them the greatest money-makers for dairymen. Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America.

FEED RICE.

[Written for Pacific Rural Press by H. O. Jacobson, Butte City.]

The question of feeding rice resolves itself into one of dollars and sense. Barley is extravagantly expensive while rice is cheap. In most markets barley sells for 25 per cent more than does rice. We consider barley to be not more than five per cent more valuable than rice for feeding work stock, and less valuable for fattening purposes, either for cattle, poultry, or hogs. By persisting in feeding barley now the feeder wastes \$10.00 for each ton he uses.

California barley stocks are low and prices tend to rise as a consequence. On the other hand, a number of causes have restricted the movement and distribution of the 1916 crop of rice. Many of the rice farmers lack capital, since what they have is represented by the paddy in the warehouse. The California rice industry is an invaluable asset to the State; and a very big factor in the development of certain extensive areas. It will be the connecting link between the extensive grain farming operations of today and the better balanced farming methods of the near future. The animal industry interests of the State can lend a strong hand now to help the rice industry out of a depression and save money by so doing.

ABNORMAL BUTTER RECORDS.

The astonishing production of 50.7 pounds of butter in seven days by the New York cow, Segis Fayne Johanna, recently announced, calls to mind that the Missouri College of Agriculture first showed several years ago how these abnormally high seven-day butter records are brought about. The cow is fed heavily while dry for some time before calving and begins the milking period with a large amount of surplus fat on the body. If the animal is naturally a heavy milk producer these conditions invariably cause the animal to be underfed for a period of time after calving. It is this underfeeding which causes the cow to take off her excess body fat laid on before calving and put it into the milk.

The effects of underfeeding on the milk and butter have been extensively studied by the Missouri Experiment Station. Recently published results of these experiments show that the butterfat produced during the high seven-day tests has a composition such that it appears to have been mixed with oleomargarine. The butter would not pass for pure butter, according to the Government pure-food standards.

The Missouri Station tests also indicate that underfeeding is probably involved in all manipulations which cause abnormally high fat production for short periods of time. The butterfat produced is also likely to be below the standards for pure butter of the United States pure-food laws.

The business of the American Berkshire Association during March exceeded that of any month in the history of the Association. The increase in registration was 45 per cent greater than in March, 1916, writes F. S. Springer.

Half a Cow-

Half a cow means half a profit—really a loss, because a poor producer costs as much to keep as a good milker. If you have a cow that is below par, chances are some vital organ is impaired and she needs treatment.

Kow-Kure is the one cow medicine that quickly tones up the digestive and genital organs and puts a backward cow on her feet. Try Kow-Kure on your most doubtful cow. It is especially effective for the prevention or cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc.

Sold by feed dealers and druggists. In 50c and \$1.00 packages. Write for free book, "The Home Cow Doctor."

BASSETT'S POLAND CHINAS

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Raising Poultry for Profit

PRESERVING EGGS FOR WINTER USE AT HOME.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

Preserved eggs, in the home, are perfectly legitimate, but don't make the mistake of thinking you can preserve them in any way and sell on the market, except a few to your neighbors. For many uses in the kitchen the eggs that have been stored seven or eight months are equivalent to fresh eggs and every farmer ought to put enough away during the time when eggs are cheap to last the cook during winter months.

None of the simple home methods of putting eggs up for a short time will be of much benefit in this State, unless one has a cellar. The lime method of preserving eggs is perhaps the oldest; and if done right is as good as any and much cheaper than the water glass method.

General Precautions.—Attention should be paid to the following: (1) Be sure that the eggs to be put away are perfectly fresh, gathered at least once a day out of clean nests. If any dirt is on them scrape or wipe it off rather than wash the eggs. (2) Have your solution ready and keep the eggs immersed all the time. (3) If possible save only those eggs where no males are in the yards. (4) Keep at as low a temperature as possible, the lower the temperature during the time the eggs are in the liquid, the better will be the flavor. When preserved eggs are allowed to get warm they often have a stale flavor.

The Lime Water Method.—One pound of lime, if it is good, will saturate seven gallons of water. But much lime is full of impurities; so unless it is fresh and of known quality, it is better to use, say, one pound of lime to five gallons of water. Slake the lime with a small quantity of water, then stir the milk of lime into the rest of water. After stirring a few times, allow the liquor to stand a few hours to settle, have the eggs packed in a crock or keg that can be closed tight. Pour the clear lime water over them, leaving the settlings in the vessel it was in. Exposure to air tends to precipitate the lime, so the vessel containing lime-preserved eggs should be kept covered until needed for use.

Water Glass Method.—Water glass varies some in quality and color; that coming from Germany is usually dark, while the American kind is white or nearly so. Both kinds vary in strength, but that can be adjusted by allowing for it. Eight quarts of water to one of water glass is about right. Boil the water—not merely heat it, but see that it boils—then set aside in a closed vessel to cool. Have the eggs packed (I always think they hold up the yolk better if packed large end down), then pour your cold water glass over them, cover with a cloth and something that will hold the eggs down in the water. If the work is done right eggs will keep a long time preserved in this way.

Hot Water Method.—For eggs

that are not to be kept very long this method keeps eggs the nicest for cooking, as they do not absorb any odor or foreign taste. But they must be strictly fresh. Place your eggs in a wire basket and hold them in boiling water, while you count six. Let them dry and cool off, then pack in a layer of clean oats, a layer of eggs and a layer of oats until you have all you need, cover and put in as cool a place as you can find. You will like these eggs best of all.

Packing Eggs for Hatching.—Whether you are packing one setting or 100, line your basket well, bottom and sides, with excelsior, then wrap each egg in a piece of soft newspaper and a little bunch of excelsior. Press down in among the other lining, and over every layer put a good thick layer of excelsior, then another layer of eggs, always having a well-rounded top so that expressmen cannot place anything of any weight on top of your eggs. Put a postcard addressed to yourself in the package asking customer to report breakages and bad hatches. You will find your customers will appreciate this on your part.

Little Chick Suggestions.—Keep little chicks from getting chilled. Don't feed too early (48 hours for incubator chicks, 24 for chicks with natural mother). Chicks of small breeds should be taught to perch at 8 to 10 weeks old; they thrive better after they commence to perch. If kept two or three nights in a brood coop, they will go to it even if given their liberty and range.

Look out for head lice on baby chicks if older fowls are around. A few drops of oil of cedar rubbed under the hens' wings will keep them away. And it will not hurt the chicks to put a few drops on top of head and around the throat.

Warm Weather Sprouted Oats.—We are going to have some warm weather soon, no mistake about it. Nature plays freak tricks, but she is bound to give us some warm days. Then we can sprout oats right out in the ground. Soak a bushel of oats overnight. Make a frame of 1x6 lumber, pour the oats inside the frame on the plowed ground and cover the oats with one inch of dirt, sprinkle every day and in a few days they will be growing through. They are now ready for feeding. Cut a piece about a square foot for each fifty hens a meal. You can't feed anything finer to breeders, layers, or little chicks. It's good for all of them and about the cheapest feed you can get, and it's good for little turks, too.

Brooding Notes.—With eggs higher in price, chicks must certainly cost more, so why not plan to make sure the brooder stove is working right and raise all the chicks. I believe it pays to hatch or buy only what you can take care of properly; the idea that if you raise a certain per cent you are doing as well as the average is up to, shucks!—a man or woman who ever expects to gain headway must raise the standard of his work above the average. Here's a pointer, paste it in your hat: Nobody ever succeeds

until they get too big for the place they are in. You can't lift yourself by your bootstraps, but you can make yourself too big for your present job by doing better every day. If you raised 50 per cent of your chicks last year, make up your mind that you are going to raise 75 per cent this year, next year raise it to at least 90 per cent and there is no natural law to prevent you raising 100 per cent. Wilful neglect of baby chicks is criminal, only it is outside the law and we can't touch people for it.

RABBIT POINTERS.

[Written for Pacific Rural Press.]

H. H. Ballou of Imperial county, who has raised lots of rabbits for meat, was just liberating some youngsters in a pen made by stretching fine mesh wire around a tree in a trench 2½ feet deep and a dozen feet square. The wire reached about 2½ feet above ground. It was expected that the rabbits would burrow for protection from the weather.

His successful experience was in Los Angeles county, and these were his first in the Valley. Of all he had raised his losses were practically none. He fed green grass, alfalfa, etc., but never while it was wet with rain or dew. Rolled barley and corn

Poultry Breeders' Directory.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

EXTRA QUALITY White Leghorn chicks, 12c until March 1st, then 10c. Carefully line bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying, and lose a dollar per pullet in raising; get the Best and Succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hogenized White Leghorns. Bigelow chix are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. Shipped on approval; examination before paying. The Bigelow Poultry Ranch, Sonoma, Cal.

SECOND HAND WATER PIPE and Screw Casings. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. Sheeter Pipe Works, 308-8 Howard St., San Francisco.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a Square Deal. Weissbaum Pipe Works 160 Eleventh St., San Francisco.

ORCHARDISTS, ATTENTION—Are you fighting the Argentine Ant? Write for prices on Argentine Ant Poison, Orchard Traps, etc. Jas. E. Filgate, Manager California Anti-Ant League, 3800 East 14th St., Oakland, Cal.

AT LAST THE PERFECT TOOL—THE Star Round: No hoops. No bolts. No experiments. Any one can erect. Close prices. Address D. O. Lively, 215 Hobart Bldg., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths' Cash Store, 106 Clay St. San Francisco.

JOE MILLER'S WHOLE WHEAT BREAKFAST Food. Miller Milling Co., Alpaugh, Cal.

SEEDS, PLANTS AND TREES.

ALFALFA SEED—There is a difference in the varieties and strains of alfalfa seed. Send your address for sample and our low price, and we will tell you just how our seed is selected—and why. Bomberger Seed Co., Modesto, Cal.

SEED BEANS—We sell direct to the grower. Buy now before the advance. Our stock is carefully selected. Satisfaction guaranteed. Tell us the nature of your soil and we will suggest the best variety. Modesto Farmers Union, Modesto.

WALNUT GRAFTING WOOD—Genuine Franquette. Same strain as Vrooman orchard was planted from. Willson's Wonder, grown by originator. F. C. Willson, Encinal Nurseries, Sunnyvale, Santa Clara Co., Cal.

WALNUT SCIONS—26 varieties. Guaranteed true to name and from bearing trees. Good firm grafts sent. Our walnuts win first prizes at all State and County fairs where entered. Tribble Nurseries, Lodi, Cal.

SEED CORN—Egyptian white, large pure white kernels. High germination test. None better offered. Also milo maize, feterita, and Egyptian wheat. Modesto Farmers' Union, Modesto.

QUALITY TREES—Seedlings, 5c. Prunes, 10c. Walnuts, 30c. Cash Nurseries & Seed Store, Sebastopol, Cal.

FOR SALE—Walnut Trees. Magnolia Nurseries, Whittier, Cal.

WANTED:

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

EXPERIENCED SWISS DAIRYMAN wants to rent a dairy on shares, or will take full charge of a dairy ranch as foreman. Can give references if required. Box 490, Rural Press.

COUNTRY LANDS.

ORCHARDISTS AND DAIRYMEN—Before you invest, investigate Mountain View, in the center of Santa Clara County's fruit and dairy section, 5 miles from Stanford University, 35 miles from San Francisco. Rich soils, abundance of water. Ideal climate. Write for catalogue, "California's Choice Acres," William P. Wright, Mountain View, Santa Clara Co., Cal. The Oldest Real Estate Office in Northern Santa Clara County. Established 1901.

FOR SALE—560 acres good loam land, fenced and cross-fenced one mile creek front; no alkali. 60 acres creek bottom, 300 acres level upland, 200 acres rolling hills. Best nut, fruit or dairy land. On line between Sacramento and San Joaquin Counties, four miles from electric road. Two good barns, granary, milk house, 9-room house, etc. Price \$80 per acre. Enquire owner, Mrs. A. West, 2200 Ninth Street, Sacramento.

ALFALFA LAND FOR DAIRYING—Also first-class Orchard land. 10 acres and up. Brentwood Irrigated farms in Contra Costa County, 63 miles from San Francisco. Easy terms of payment. For prices, etc., address Balfour, Guthrie & Co., Land Department, 350 California St., San Francisco.

FOR SALE—948-acre stock ranch in Napa county. Price, \$17,000 net. All modern improvements. Living creek. 125 acres hay, grain and alfalfa land. Free range adjoining 175 head of cattle can be purchased if desired. Liberal terms. Owner, Box 383, Napa, Cal.

\$5,450.00—Andrew Linquist, 20-acre Peaches and Grapes ranch, two miles west Kingsburg, California. Improvements. Half interest. Pumping plant. See Linquist, C. E. Robertson, 105 Montgomery St., S. F.

FOR SALE—Dairy ranch, 30 acres all in alfalfa, with improvements, in the Patterson irrigated colony, one mile from town. \$5000 down, balance to remain. C. J. Clemens, Patterson, Cal.

completed the ration. "So long as you feed right and keep the pens clean and dry, you are not likely to lose any," said he. If the pen is not kept dry, they are likely to die with snuffles; and once in a while a barley beard may get into one's throat and will it.

Kink on Shipping Rabbits—In shipping the stock to the valley, they were designated "Market stock" and came at half the express rate that would have been charged for breeders. Of course in case of claim for damages, they would have been rated at market prices.

BROWN EGGS EQUAL TO WHITE.

[Written for Pacific Rural Press.]

The prejudice against brown shell eggs has practically disappeared in California except in the San Francisco market. When the brown shell eggs are fresh, clean, of proper size, and correctly marketed, they now sell for practically the same price in Sacramento and Los Angeles as white-shell eggs. This prejudice is still maintained in San Francisco, for the reason that Petaluma, Hayward, and other nearby poultry centers produce white-shell eggs almost exclusively, and these poultry centers carefully grade and ship every day. On the other hand, brown-shell eggs are usually produced from small flocks, or in districts where there is a limited supply; and for this reason are more or less held at point of production until a large shipment can be made. If the brown-shell egg is shipped promptly and handled the same as the white ones are being handled, the brown egg is equally good; which fact the general public of San Francisco do not understand. All California markets are over-supplied with small-size hens for killing purposes and are short the larger fowls, which are more suitable for table purposes. As a consequence, hundreds of carloads of these larger fowls are shipped into the State each year. Many California poultry-keepers realize that they could greatly increase their profits by raising the larger fowls, which are the producers of brown eggs, if they could market their eggs in San Francisco and receive the same price as for white-shell eggs. When this prejudice against brown-shell eggs has been overcome in San Francisco, many poultry people will be induced to produce these larger fowls, for the reason that the price per pound now being paid for large mixed colored hens, averaging 5 pounds each, brings the price to nearly twice as much per dozen as the present price paid for leghorns.

QUESTIONS ANSWERED.

[Answered by Susan Swainsgood, Pomona.]

Toe Picking—Is there any remedy for toe picking among baby chicks?

R. S. COELHO, CORCORAN, CAL., Owner.—150 acres improved, subdivided alfalfa dairy. Stratford. Keeps 85 cows. C. E. Robertson, 105 Montgomery St., San Francisco.

FOR SALE, RENT, OR LEASE on reasonable terms. Creamery in good dairying section for summer business. For particulars, apply Box 84, Quincy, Cal.

STEVENS COUNTY—Logged-off land where stock-raising and dairying pay. Free booklet. Phoenix Lumber Co., Crop Department, Spokane, Washington.

FREE NEW BLUE BOOKLET—State Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

640-ACRE MONTANA HOMESTEADS—New law. Circular free. Bureau 27 Boulder, Montana.

—H. J. B., Petaluma.

The only remedy for toe picking is to remove the afflicted chicks as soon as found. Prevention, however, is not so hard, for it consists chiefly in providing lots of light in the brooding houses, and a deep fine litter such as oat hulls, rice hulls, or finely chopped straw under which the feed is thrown in order to keep the chicks busy on the ground. There may be something in the idea of giving them meat foods, but we doubt this. A number of leading poultrymen have suggested to us that they believe toe picking is primarily due to idleness in combination with the appearance of the chicks' toes, which look like worms. When the other chicks have tried to dig up these worms and have drawn blood that makes cannibals of them.

Rice and Mash for Hens—Is California whole rice with the hull on sary to cook it, howshrdlu shrdlu all right to feed chickens? If necessary to cook it, how does it compare with other feed? My poultry after having been at large for a year are now enclosed in yards and some are going light. Several have died. They were thin and weighed almost nothing. Internal organs seemed normal. Kindly give me proportions for a mash for 50 hens. I am giving middlings, bran, beet pulp, beef scraps, and alfalfa meal mixed in equal proportions, with plenty of grit and oyster shell.—Mrs. L. F. E. Crush your rice so that the hulls

can be left by the hens as scratch litter. Cooking would scarcely pay; but you might cook it and use in the mash in place of beet pulp. Your feed is too rough already. Do not feed rice with hulls on. For your mash take two parts corn meal, two of bran, two of middlings, two parts cooked rice, half a part alfalfa meal, one part bone meal, two parts beef scrap, and a little salt. Feed all they will clean up soon. Twice a week add a little sulphur to the feed, and keep grit oyster shell, and coarse charcoal before them all the time.

ORIENTAL FADS.

Dear Friends: This spring sees a fad for Chinese things. Cunning novelties, furniture and clothes reflect its influence. The shops show things all made up, but any one clever with needle, paste and scissors can make attractive things for the home or for gifts from brocades of bright rose, blue, and green, Chinese embroidery and gold braid.

The telephone book is a new idea. It is a cover for that usually unsightly, mistreated necessity. Two pieces of cardboard for the backs and one for the end, a little wider than the book, are necessary. Pad the front and back slightly and then cover with Japanese crepe.

Paste the edges down neatly and line the inside with a dark color. The edges of the lining are hard to get down smoothly, but care here will give a finished air to your work. Two that I saw were of this soft silk crepe, one yellow with birds flying across it, the other blue figured all over with flowers. Both were finished with a tassel of a corresponding shade.

Large guest books, too, were covered similarly. Another shop displayed tapestry-covered and cretonne-covered guest books.

Magazine covers, too, now much in vogue, were covered with bright brocade and trimmed with gilt braid for a festive gift, and others were shown of patent leather with a bright stenciled flower on the cover. The magazine covers have a flap on the inside by which the magazine is held in place.

Very attractive book ends about five inches high are shown too in these bright materials. A foundation is of metal, bent so that there is a base. This is covered with felt on the inside and on the base. The ends are padded and covered with bits of Chinese embroidery richly lined with gold threads. The edges are finished with braid.

For the dresser there are many attractive things easily made. Round pasteboard boxes four or five inches high with covers are fitted with brocade and finished with braid to hold face cotton. Perfume bottles in odd shapes, carefully covered, are attractive too. Then slim tall bottles are covered carefully, and finished at the top with a cushion gay with color and covered with net through which you push your hat pins when you remove them. Trays are made in which glass is fitted, then under this glass is put a pretty piece of tapestry, or brocade covers the whole bottom. These trays are silenced by fitting felt on the bottom. Braid finishes the narrow sides.

Adorable pin-cushions can be made in any shape or size with this lovely stuff. And powder dishes may be made from small round boxes or dishes of which the sides are carefully fitted with material.

A lovely shade for the lamp could be made of four pieces of brocade fitting smoothly and light silk gathered onto the frame separating the brocade and setting it off. Shades for other lights in the room would be pretty if made in the same design.

Scissors or paper knife slipped

THE HOME CIRCLE

into a Chinese case and pulled out by a tassel is pretty on a library table.

Chinese cash, beads, characters cut from celluloid or felt and tassels combined with bright narrow ribbon are fashionable for hat trimmings.

Bags oblong in shape pull up like a fan and are made of embroidery combined with plain stuff. Long narrow bags with bracelets to carry them by slip on the wrist. Card cases and flat pocket books, carved ivory beads in white and colors, sandalwood beads, jade, rare oriental designs in jewelry are all fashionable now.

In furniture too this oriental influence is felt. There are softly tinted Wilton rugs reproducing Chinese and Persian designs. There are spindle-legged chairs and tables in dull black with green and rose trimmings with Chinese characters or designs in dull gold. Even in dishes, one shop showed a dull black set decorated in bright colors and another set in yellow, with Chinese decoration in yellow and purple. A specialty shop showed pretty sewing sets easily made. From a glass bracelet which was covered, hung a little bag for thimble, etc., a tiny heart-shaped book for needles and a scissors case all made of silk crepe. They were suspended by

cord, and a tassel finished off this pretty accessory.

Rosabella Best.

EGG ROLLS.

One cup mashed potatoes. While hot add $\frac{1}{2}$ cup sugar, 1 compressed yeast cake dissolved in cup of warm water, 1 cup milk that has been scalded and then cooked, to lukewarm, 2 well beaten eggs, 1 cup of flour. Mix well and stand bowl over pail half full of hot water. Let rise to double size, then add 1 tablespoon salt, 2 tablespoons shortening and 1 quart of flour. Knead 5 minutes, put in bowl and place over hot water as before. Let rise to double size, knead again, roll out and cut with biscuit cutter. Put in well buttered pan, let rise 20 minutes and bake. From start to finish, this should not take over 4 hours.

TO KEEP EYEGASSES CLEAR.

Editor Home Circle: I have worn glasses for years and have been much troubled by the collection of moisture on them. I am very glad to be able to tell other women who have had the same trouble that if the glasses are rubbed with soap every day and then polished, there will be no deposit of moisture.—Mrs. S. A. M., Vallejo.

SPANISH RICE.

Drain part of liquid from 1 can tomatoes. Cook pulp, press through colander and when cool put to soak in it, in the double boiler, $\frac{3}{4}$ cup washed seedless raisins. Let stand until raisins are plump. Cover $\frac{1}{2}$ cup rice with 1 quart cold water; bring slowly to boiling point. Take from fire, drain and rinse and add to tomato pulp. Add 1 large, sweet green pepper cut in shreds, 1 teaspoon salt and pint of water. Cook over lower boiler until liquid has been well absorbed and rice and raisins tender. Before serving, carefully mix in 2 tablespoons butter.

"Prices are going up, but I pay the same for my Styleplus Clothes!"

Although you get the same Guarantee of Satisfaction with every suit, the price of Styleplus Clothes hasn't advanced a single cent! Still \$17—the same always, everywhere. [By Geo. N. Tyler.]

Conserve Moisture.—This is important as the sun gets higher, the top soil having a tendency to bake. If it forms a crust, a great deal of moisture is lost out of the soil by evaporation. Use the hoe and rake and cultivate. Keep a two-inch blanket of fine loose soil on top. You do not know what a benefit this is to your plants. You can get along with half the amount of water, and another thing, it causes the plants to send down deep roots, and by thorough cultivation, plants will go through a dry spell in much better condition. If you have to water, give a good soaking, then cultivate again. This daily watering is of more injury to your plants than good as it causes the roots to come to the top, and as soon as it dries out a little the plants wilt. A mulch is better than nothing; lawn clippings, straw or straw manure, leaves, excelsior, shavings, all make mulches, but even the mulch causes the roots to come to the top. I can grow better plants with the use of the hoe and rake, with one-fourth the amount of water that some use.

Seedling Planting.—Those who neglected to sow seed at the proper time can procure the young seedlings from the nursery men and florists. In planting out seedlings, do so on a cloudy day or in the late afternoon and evening; leave a little hollow around each plant, and fill up with water as soon as planted. The main injury to transplanted stock is caused by evaporation before the plant has begun to draw moisture from the soil. If they are very soft they should be shaded from the hot sun for a day or two. A shingle pushed into the ground on the south side leaning over the plant will do very well. But if you have a row of them, stand a board on edge against a couple of slanting stakes to keep in place.

Feed Pelargoniums.—Pelargoniums in pots are now beginning to show bud. If you want some large flowers for exhibition, work in a teaspoonful of fine bone meal to a six-inch pot. This is better than liquid manure, for manure of any kind around a geranium or pelargonium makes them make a long jointed soft growth, with lots of foliage, and few flowers, while the bone meal makes a short growth with plenty of large exhibition flowers. It is slower in action and one application will do for the blooming season.

Watsonias and Gladioli.—If you have not planted Watsonias and Gladioli do so at once in sandy soil if possible. Set them from five to six inches deep, so they will not have to be staked. In heavy soil four to five inches is plenty deep enough.

All bulbous plants in pots that are through flowering should be planted out in a shady location and watered, and induced to grow as much as possible so they will make a blooming shoot for next year. If you don't you might as well throw them away, for they will come blind, and will not bloom till the year after.

When stove pipe will not draw, a piece of zinc put on the live coals in the stove will clean out the pipe.

Good Health.

[By H. E. Pastor, M. D.]

"Cherubim on Toast."

This is what Mr. F. A. Thornley of Contra Costa Co., who criticises somewhat caustically our item on vivisection in the Pacific Rural Press of March 17th, suggests that this writer might prefer as a choice morsel on his menu. Perhaps; but as cherubim are presumably of heaven, and not of earth, and as we have not yet attained to our celestial abode, we have had no opportunity of sampling the dish. Mr. Thornley flatly contradicts our statement that man was given dominion over animals by divine law, and says that such assumption of superiority is a "natural law." May be so. In either case, however, it is a compelling principle of human action. Self-preservation is said to be the first law of nature, and, whether against the lower animals or against his fellow-beings, man always has, does now, and presumably always will recognize and act on this principle.

The real basis of Mr. Thornley's grievance seems to be that he doesn't like meat, or at least the preliminaries to the preparation of the animal for conversion into meat. Neither do we, nor many similar things. We don't even like the necessity of killing coyotes, bob-cats, bears, snakes, gophers, flies, mosquitoes, etc., but when they pit their lives against ours in the struggle for existence there is going to be a scrap, and we propose to put up the best fight there is in us. Broadly speaking, this about represents the attitude of man toward the animal creation—and so far man has won out.

If we printed Mr. Thornley's letter in full, which we would like to do, there would be no room left in our allotted space for a reply; and we can't endure to be stirred up and coked up at the same time. However, we quote this rather alarming sentence: "Personally I am too depraved to be a vegetarian; indeed, have committed many thousands of murders." This sounds like a most abhorrent confession, but we cannot be persuaded that Mr. Thornley is half as bad as he pleads guilty to being. We imagine he is a very amiable gentleman, void of offense to man or beast, and is merely a trifle peculiar in his dietetic scruples. Nevertheless, he vivisects our argument with merciless denunciation, and we feel quite cut up about it.

White Rice and Brown.

A few weeks ago we had a line or two on the subject of rice. We have just received from the California State Board of Health a circular in which Professor Jaffa has a timely word on the relative food value of brown and white rice. He says the brown rice contains about four times as much mineral matter as the white, the bran and other nutritive portions of brown rice being removed in the polishing process. He says that when the water in which brown rice is cooked is discarded much of this valuable mineral matter is lost. For this reason, steaming or preparation in a double boiler with no excess water added is recommended. This is a matter of special interest to California at this time.

California's Mineral Oil Best for Medicinal Use.

Since writing the item for the Rural Press last week on the efficacy and adaptability of mineral oils to obstinate cases of constipation, we have been favored with three little brochures from E. R. Squibb & Sons, New York, manufacturing chemists, on this subject, in which the following language occurs, which should interest Californians:

"Just as Russian oil, because is a naphthene oil, is superior to all American oils, except the heavy Californian, so is the heavy Californian liquid petrolatum in turn superior to the Russian oil, because: 1. It is free from unsaturated hydrocarbons. 2. It has a greater specific gravity. 3. It has a greater natural viscosity. 4. It is composed entirely of naphthenes." What distinction is next in order for California? There are few things worth while that California hasn't got.

HELPFUL CLEANING HINTS.

To keep the color in ecru lace dip into weak coffee.

Keep a blotting paper under silk while sponging with alcohol and there will be no ring around the spot.

Keep white silk articles, white furs and plumes in a blue-lined box to prevent their yellowing.

Gasoline removes chewing gum.

Do not apply hot water to an egg-stain as it cooks it in. Soak in cold water.

Use a bit of velvet for brushing silk. It is not so hard on it as a stiff brush.

Soften varnish stains with alcohol, then after scraping, clean with ammonia.

A good scrubbing with oxalic acid for a coarse weave and a corn meal rub followed by a peroxide bath for a finer one, will do wonders toward bleaching a last summer's hat.

Mildew may be removed with lemon juice and sunshine.

TO SACRAMENTO

Fast electric trains leave San Francisco every 2 hours during the day. One way fare \$2.50. Week end round trip \$3.35. Sunday round trip, \$2.50. Convenient and comfortable electric train service from Bay Cities to Sacramento Valley points, including Woodland, Marysville, Oroville, Colusa, Gridley and Chico.

GEO. N. TYLER, Brookdale Nursery, Los Gatos.

KING EIGHT

SEVEN PASSENGER TOURING
\$1585

Low cost of operation and upkeep, coupled with high power and reliability, have made the King a favorite car among Farmers

THIS Company has found that Farmers want all the style, finish, comfort, and luxury required by the city man, but are interested in those qualities only after a car's mechanical superiority has been proved.

The KING chassis for 1917 is substantially the same as the one which earned this Pioneer Eight a reputation for efficiency, power and economy all over America and in fifty-two foreign lands. It was this chassis which made the famous sixteen KING stock car road tests last year, adding many notable chapters to automobile annals.

This remarkable mechanism embodies a practical experience possessed by few manufacturers and represents the eight cylinder V-type motor at the point of its highest development. It is the most economical car for its power now being offered and is built to endure the hardest service for many years.

Sixty horse-power, Model EE may be had in four luxurious body models; Touring, Foursome or Roadster, \$1585; Sedan, \$2150. Prices F.O.B. Detroit. There is a KING dealer in your vicinity. Write for descriptive matter today and let us tell you where to find him when you are ready.

All prices quoted may be advanced at any time

KING MOTOR CAR COMPANY, DETROIT, MICHIGAN

SAN FRANCISCO.

San Francisco, March 28, 1917.

WHEAT.

The advance in wheat prices continues, despite somewhat heavier offerings. Local market conditions are all in favor of the seller and still higher figures are looked for. Northern stock is in especially good call and local dealers say that record prices on this variety are to be expected. Shipping orders are more than normal, and most of the small town dealers are getting as large a stock on hand as they can.

Sonora wheat None offered
Northern club None offered
Calif. Club, ctl. \$2.90@2.95
Northern Bluestem 3.15@3.20
Northern Red 3.10@3.20

BARLEY.

The slow production of green feed is responsible for heavy buying of barley, which is being used extensively for stock feed and a firmer undertone rules trading in this grain than for several months. Only in round lots is feed stock selling below \$2.35 per cental and general indications point to a stiffer market. The quotations on seed have been dropped, as this trade is hardly a market factor now.

Shipping, ctl. \$2.35@2.40
Brewing Nominal
Choice feed, ctl. 2.30@2.35

OATS.

White and red feed oats both advanced during the week, with Texas stock holding very firm at previous quotations. There has been an excellent shipping demand for this grain and there is every reason to look for still higher figures.

Red feed \$2.00@2.05
White 2.20@2.25
Red seed (Texas) 3.00@3.10

CORN.

The reaching of record prices on corn at Chicago has been reflected in this market by sharp advances throughout the entire list. The higher figures have apparently had no effect on trading, however, as hog owners are determined to reap the benefits of the fancy livestock prices. Egyptian corn is in very good demand and several large sales to southwestern interests reported.

[First-hand prices on strictly first-class grain, San Francisco.]
Eastern Yellow, ctl., bulk \$2.40@2.45
California, sacked 2.40@2.45
Milo Maize 2.35@2.40
Egyptian 2.50@2.60

BEANS.

This has been a quiet week in the bean market, due principally to the unsatisfactory freight conditions. Most of the lots which left here for the East within the past two months are still on the road, and those buyers have been rather wary about buying much more until their present holdings have been received and disposed of. Steadier prices on Mexican reds was the only price change recorded last week.

Bayos, per ctl. \$ 8.25@ 8.50
Blackeyes 7.00@ 7.20
Cranberry beans 9.75@10.00
Horse beans 5.50@ 6.00
Small Whites (south) 11.75@12.00
Large Whites 11.75@12.00
Pinks 8.75@ 9.00
Linas (south, reclaimed) 12.25@12.50
Red Kidney 11.75@12.00
Mexican Reds 8.00@ 8.25
Tepary beans 8.50@ 8.75
Garbanzos 4.25@ 4.50

HAY.

Receipts of hay at San Francisco were again in excess of those reported for the preceding week, but the call from the country sections is increasing and the supply is still short of the demand. Despite concerted efforts to get along as economically as possible, city holdings are rapidly dropping and country sections that ordinarily never enter the San Francisco market at this season of the year are clamoring for hay. Grass Valley ranchers report that cattle are dying by the score and that hay is costing \$36 per ton there, a quarter century record price. Modoc county is still receiving good-sized shipments of Nevada hay, but reports that stocks are still insufficient. That present California stocks will not be sufficient to carry through till the new crop is ready is the general belief. Export demand has been heavier than normal and other Western States have made inquiry in California for hay, indicating that this is not the only State in this section whose supply is below normal. The demand for alfalfa at interior points has been so good that very little alfalfa has been received here.

[Price per ton, carlots, San Francisco.]
Wheat, No. 1 \$25.00@26.00
No. 2 23.50@24.50
Tame oats 23.00@24.00
Wild oats 19.00@20.00
Barley 22.50@24.00
Alfalfa 20.00@23.50
Stock hay 15.00@16.90
Straw, per bale90@ 1.10

FEEDSTUFFS.

Feedstuffs have generally followed the lead of hay this past week, and most offerings of this type have been advanced. There is an especially noticeable shortage in middlings, and fancy offerings are commanding a premium over the quotations.

[Per ton, San Francisco.]
Beet Pulp, per ton \$32.00@33.00
Alfalfa meal, per ton 25.00@26.50
Bran, per ton 33.00@34.50
Oil Cake 4.00@4.50
Coconut cake or meal 32.00@33.00

POTATOES, ONIONS, ETC.

Asparagus receipts are picking up so rapidly that each day sees further cuts in price, none of the dealers caring to be caught with any stock to carry over. Receipts are averaging two thousand boxes daily. The frosty mornings have cut into the quality of the peas offered, and really good stock has been commanding better figures. Lettuce held about steady in the absence of fancy grades. Potatoes and onions held practically unchanged during the week, despite the offerings of another lot of Japanese onions and one lot of Australian goods.

POULTRY.

The absence of Eastern competition has served to steady poultry quotations, although a combination among local retailers prevented as large an advance on hens as on the other items in the list. These men agreed among themselves not to pay more than 25 cents per pound for hens, with the result

half cent higher on all grades. A large number of dealers are storing in good-sized lots, entries at the ice house for the past week being reported as in the neighborhood of ten thousand cases. The Poultry Producers' are storing freely at this time, as are all of the speculative dealers. Those houses which store only enough to handle their own winter retail call are still holding back. The Northwest and Southern California are both heavy buyers here, and some Eastern business is reported.

CITRUS FRUITS.

Quotations on citrus fruits were without change, although heavier buying of lemons followed the rumor of

FOODSTUFFS IN STORAGE IN CALIFORNIA.

The amount of foodstuffs on storage in the State was secured Mar. 1 to 5, by county assessors for the State Board of Equalization, pursuant to a Senate resolution. From the Board of Equalization's report to the Senate Mar. 21 we have cast up a few of the items, getting the following totals in cwt.: Potatoes 171,902; beans 567,977; onions 4138; rice 839,253; barley 295,075; wheat 261,017. This represents 50 counties, those not reporting having none to speak of. Sixteen counties reported practically no food supplies stored, other than required for local consumption within a month. Many other counties reported less than usual at that time of year.

that this was the top price in the market. Broilers, fryers and young roosters were all higher and fancy squabs also advanced.

BUTTER.

Local butter traders have twice within the past week been confronted with the peculiar situation of a single price on butter. This is said to be due to the fact that nearly all of the butter being manufactured by California creameries at this time is of such quality as to grade an extra. Shipping business continues as an important part of the trade, with the East and the Pacific Northwest heavy buyers. Nominal sized lots have been sent to Southern California points.

Grapefruit, fancy 2.25@3.00

DRIED FRUITS.

There have been no notable changes in the dried fruit market during the past week, principally because buyers who could pay cash are not in the market until they know better what turn international conditions will take; and sales to the other type are not desirable or necessary this year.

[Net to growers, bulk basis, f. o. b. shipping point.]

BERRIES.

Strawberries have been a feature of the market this past week, with good lines commanding as high as \$3.75 per crate and off-grade goods selling at \$1.50@2.25.

Strawberries, per crate,
choice \$2.75@3.75
Off-grades 1.50@2.25

Special Citrus Market Report.

Los Angeles, Mch. 27, 1917.

Shipments of citrus fruits from Southern California from November 1 to March 25, 13,911 cars oranges and 2,501 cars lemons. Same time last year 11,495 cars oranges and 2,244 cars lemons.

Shipments from Central California from November 1 to date, 4,046 cars oranges and 163 cars lemons. Same time last year 4,199 cars oranges and 143 cars lemons.

The past week saw both higher and lower markets East. Our review week started out higher with a good demand both for oranges and lemons. This was a signal for freer shipments and the current week saw the heaviest shipments of the season and the result was the improvement of the early part of the week was lost. Still all well-known brands of popular sizes sold very well. Locally the market had a little better tone. Oranges were not notably higher, though all good highly colored fruit met with good demand. Local packers bought steadily at 1@1 1/2 c per pound for paves in the grove picked. Grapefruit in better de-

mand and 1/4 c higher. Selling at 2@ 2 1/2 c per pound in the grove picked. Tangerines were dull. Not many coming in and not many wanted. Prices, 1@1 1/2 c per pound in the grove picked. Lemons still drag. The best were in fair demand at 1@1 1/2 c per pound in the grove picked, all else hard to move and have to be sold for what they will bring.

AUCTION SALES.

New York, March 26.—Sixty-one cars navels; one bloods; nine navels, bloods, tangerines and St. Michaels, and six cars lemons sold. Navels 25@ 40c lower; biggest decline on small sizes. Lemons firm. Weather fair. California navels averaged \$2.55@4.15. Lemons averaged \$3.60@4.66.

Boston, March 26.—Thirty-three cars sold. Market lower on oranges, doing better on lemons. California navels averaged \$2.50@3.80. Lemons averaged \$3.25@3.65.

Philadelphia, March 26.—Market strong. California navels averaged \$2.75@3.30. Lemons averaged \$3.40@2.80.

LOS ANGELES.

Los Angeles, March 27, 1917.

BUTTER.

Receipts of week ending Mar. 27, 1917—288,560.
Receipts of week ending Mar. 27, 1916—361,720.

The market here the past week was again featureless. Receipts were lighter than last week and the same week last year. It was a 33c market for extras up to Monday. While production was reported better by some of the out-of-town creameries others said they were making no more butter. Eastern markets unchanged up to Monday from a week ago. Tuesday with higher markets both north and east the market here on call was bid up 1c but no sellers; the light receipts making holders reluctant to let go even at the highest price for two weeks.

We quote extra creamery 34c

EGGS.

Receipts (railroads) for week ending Mar. 27, 1917—3873 cases.
Receipts (railroads) for week ending Mar. 27, 1916—4558 cases.

A steady and firm market was had the past week. Receipts were somewhat better than the week before, though lighter than the same week last year. A very good demand was had from the consuming trade and as the Eastern markets were firm with an upward tendency there was very good buying to go into cold storage. Chicago advanced 1c on first up to Monday and New York 1 1/2 c on first up to Monday. It was this that stimulated the demand from the cold storage people who profess to see in it a high market next fall and winter. Monday's prices were bid for round lots but no sellers.

POULTRY.

A steady though hardly so active market was had the past week. Young stuff, fryers and broilers more than hens and roasters which continue in fair demand. Turkeys and ducks still moving fairly well. Receipts altogether local and show some falling off from a week ago. Prices unchanged.

We quote from growers:
Broilers, 1 1/2 to 2 lbs. 32@33c
Fryers, 2 1/2 to 3 lbs. 28c
Hens over 4 lbs. 22@23c
Hens, under 4 lbs. 21@22c
Ducks 22@23c
Geese 18@19c
Roosters, 3 lbs. up (soft bones) 26c
Turkeys, heavy, 12 lbs. and up 29@30c
Turkeys, light 24@25c
Squabs, live, per doz. \$1.50@3.00
Dressed 8.75@4.85

BEANS.

The market continues quiet. High prices causing buyers to hold back and buy sparingly. But as stocks in the country are light and seeding time about at hand, holders are firm.

We quote from growers:
Limas \$13.00@13.50
Large white 12.00@12.50
Small white 12.00@12.50
Pinks 9.00@ 9.50
Blackeyes 7.50@ 8.00
Tepary 8.00@ 9.00

BERRIES.

The berry season has fairly opened. Daily receipts of strawberries are being received both from the Imperial Valley and from local growers. Prices, however, are too high for a free movement as yet.

We quote from growers:
Strawberries—
Poor to choice, per case of 30 baskets, case \$3.50@4.00
Fancy, per case of 30 baskets, case 4.50@5.00

HAY.

The market has brightened up the past week. The demand from the country for horse hay shows a marked improvement. Dairy people, however, are buying little old hay, using mostly green alfalfa. Receipts light and with a better demand all round and light stocks in the country, prices are higher all round.

We quote f. o. b. Los Angeles:
Barley hay, ton \$21.00@23.00
Oat hay, ton 22.00@24.00
Alfalfa, northern, ton 20.00@22.00
Alfalfa, local, ton 22.00@23.00
Straw, ton 11.00@12.00

CABBAGE AND CAULIFLOWER.

Not much cabbage in the past week and all good firm heads were in demand and high. Receipts not only light but what generally arriving too poor to ship. Cauliflower is pretty much out of season. Not much in the past week and what arriving generally

poor, the tail-end of the crop. Closing prices \$1.30@1.50 per standard crate from growers.

ASPARAGUS.

More in the past week and prices lower. There was some home-grown as well as Imperial and Grand Island on

sale. With increased offerings and lower prices buyers were encouraged to take hold more freely. Grand Island selling in a very fair way at 15¢@17¢ per pound, Imperial Valley 12¢@15¢ per pound and local 10¢@15¢ per pound.

Special Livestock Market Report.

San Francisco, Mch. 28.

Lambs 13 1/2 @ 14 c

THE WOOL situation is strong in California, but all concerned are guessing. In the East, wool is at a standstill awaiting Congress. Mendocino growers are still holding.

Sacramento Valley, spring clip, 40¢@45¢
Mendocino Nominal
Cloverdale 40¢@42¢
Southern, spring clip 28¢@30¢
Southern, 7 mos. 22¢@23¢
Imperial Valley, 7 mos. 30¢@35¢
Nevada, year's 35¢@40¢

HIDES are still stationary per quotations of past few weeks.

Los Angeles, Mch. 27.

CATTLE: Continued high markets East and independence of holders in the country caused packers the past week to bid steers up 50c per cwt. At this advance feeders were more disposed to sell and there was a fair movement to market and very good trading. Cows and heifers were also in very good demand and firm, though no higher than a week ago.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs \$9.50@10.00
Prime cows and heifers ... 7.50@ 8.00
Good cows and heifers ... 7.00@ 7.50

HOGS: Not so many hogs coming in and the high markets East caused killers to bid prices up 50c per cwt. all round. This advance brought in a fair supply of very good hogs from California and Arizona, but mostly light weights. The high prices of feed causing raisers to run their hogs to market as soon as they make a fair showing as to weight, and not waiting for them to become good packer hogs.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs. \$11.50@12.00
Mixed, 200@250 lbs. 12.00@13.00
Light, 175@200 lbs. 12.00@13.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: Offerings continue light and market firm the past week with a very good demand both for sheep and lambs. Yearlings were in especial request and their scarcity caused killers to bid them up \$1.00 per cwt. California and Arizona, as last week, furnished most of the supply. Spring lambs were in a little better supply, though are still too thin to attract much attention. What selling brought \$6.50@7.00 per head.

Per cwt. f. o. b. Los Angeles:
Prime wethers 9.00@10.00
Prime ewes 9.50@10.00
Yearlings 10.50@11.00
Lambs 13.00@14.00

CALVES: Arriving quite freely, slow sale and weak. Selling at \$8.50@9.50 per cwt.

No. Portland, Ore., Mch. 26, 1917.

CATTLE: Today's receipts totaled about 600 head, the market was rather active at steady to higher prices. Medium to good receipts of cattle were the best sales, prices in some cases being as much as 10 to 15c higher but mostly steady at last week's close. Cows and heifers met with an excellent call from all buyers. One load of beef steers brought \$9.65 with several bunches of good light steers from \$9.50 to \$9.55; while the bulk of the

medium to good steers brought from \$8.60 to 9.25; best cows brought \$8.00 with the bulk of ordinary to good kind bringing \$7.00 to 7.75; off-grade dairy breeds brought \$5.50 to 6.75. Bulls were in good demand although the offerings were very poor, which sold ranging from \$5.00 to 6.75; prime heavy bulls being quoted from \$7.00 to 7.25. There is also a good call for light feeding steers of good quality bringing \$8.25 to 8.75.

HOGS: Today's hog market was rather a drawn-out affair, buyers and sellers having a wide view at the opening of the market. One load of prime heavy hogs sold early at \$14.50 which was the top price; medium kind going at \$14.35. There were a good many buyers in the market but they had small orders. Pigs sold from \$12.75 to 13.25.

SHEEP: After a lull in the sheep division for several days a good supply was offered today, one load of prime wool lambs sold 40c over the previous record price, bringing \$13.50; one load of medium finished shorn lambs brought \$10.35. Demand was good. There were no butcher sheep in the market, although prime wool wethers are being quoted at \$11.50 to 12.00; good light ewes bringing \$10.00 to 10.75.

Publisher's Department.

During the past week we have added 251 new paid subscribers to our list. All secured without premiums at \$1 per year.

Next week's issue of this journal will be largely devoted to the Swine Industry of California. We have secured articles from many of the leading breeders covering every department of the hog industry. The issue will contain more pages than any previous one, and will be a noteworthy contribution to the cause of placing California pure-breeds on the map.

"I am tempted to say a few words of appreciation to you about our excellent paper, the Rural Press. I've been a subscriber, off and on, for many years and always enjoyed much of its matter, but I think it is getting better, and more of it. I was especially pleased with the issue of the 3rd inst. The editorials appealed to my understanding of conditions more than anything I've read lately, and the counsel to many inquiries on many subjects agreed with my own opinions, founded on experience. So, of course, I considered the advice sensible. I congratulate you and your subscribers on the publication of a very good rural newspaper. This is just between ourselves, not for 'outsiders.' I am very truly your old friend.—Mary Stewart Smith. Yuba City.

STRAWBERRY GROWERS ORGANIZED WITH 75%

The Central California Berry Growers' Ass'n, comprising strawberry growers of Santa Cruz, Monterey, San Benito, Alameda, Santa Clara, and San Mateo counties, has secured over 75 per cent of the acreage, according to a letter from President Mark Grimes of San Jose, to State Market Director Weinstock, under whose auspices the Association was formed. All members were called to meet March 29 at Gilroy to elect 11 directors, five of whom are Japanese, five white Americans, and one to be appointed by the State Market Director. The agreement covers only that part of the 1917 crop which is to be marketed directly or indirectly in any of the four Bay cities. This will be handled by the Association for the Growers, through any of an approved list of commission men.

CALIFORNIA'S SLOW GAME WITH SWINE.

[Twentieth of the Editor's Series of Historical and Analytical Sketches of California Farming.]

TWO rich perfumes welcomed the plain-crossing pioneers to California and are appreciatively praised in their records: the balsamic fragrance of the Sierra pine forests, which healed the alkaline irritation of their pulmonaries, and the odor of frying bacon, which, rising from open fires, filled the foothill gulches, and suggested joys more satisfying, for the moment at least, than the sight of gold in quartz and gravel. And these two perfumes are potent to the present day, for, though nearly seventy years have elapsed, and the third generation from the argonauts has been amply entered upon, Californians are still looking and longing for more balm and more bacon. One thing, at least, is capable of demonstration, viz.: California has pursued a stern-chase after porcine sufficiency from the beginning until now; only once catching a tail-hold and losing it again, as will be noted presently. It is, then, the purpose of this writing to deal with bacon and parts adjacent thereto and to note steps taken in California's pursuit of purposes which are still to be attained with hogs.

Swine were brought to California by the padres or by the soldiers who accompanied them—more likely by the latter. Probably they did not come with the initial expedition of 1769. At that time 229 animals are credited with arriving, but the kinds are not stated in such records as we have seen. It is reasonable, however, to exclude hogs, for one could hardly expect such pathfinders to drive a "passel of pigs" through such rough, trail-less country as they traversed. Nor is it reasonable to think that the pious fathers, whose burdens were largely ecclesiastical furniture, would tolerate nearness of these holy things to such well-demonstrated associates of the devil. However, the pigs came, and came soon, for Capt. Wm. Shaler of the Yankee ship "Lellia" landed in San Pedro bay in 1797 and "got supplies for a full year, including many hogs and sheep"—which was, perhaps, the first export business in California hogs. But the Missions had hogs, though relatively so few that they were not often separately noted in their inventories. There is, however, segregation of the smaller animals in this statement that at 17 of the Missions in 1825 there was a total of 1000 hogs and 100,000 sheep. The ratio is probably about right, though the figures have the roundness which would do credit to a modern statistician of the guessing class. But the Spanish derivatives did not have all the early pigs. The Russians at Ft. Ross in Sonoma county had hogs with their other livestock in 1812. From such sources, probably, came the "native Spanish hogs" which the Americans found here on their arrival, though it was said in 1860 that "the common hog of California was first imported from the Sandwich Islands." It is probable that the "common hogs" came to California from various sources, when the gold-seekers began to operate their appetites, and farmers seized what they could

get. The character of all of them is truthfully sketched in these words by C. H. Sessions, formerly a prominent swine-grower in Los Angeles county:

In former years, and in fact to the present day, there can be found on ranches in California numbers of the native Spanish hogs or "razor-backs." They are very hardy, but are not proof against diseases of the more fashionably bred hogs. They take care of themselves and live in swamps and river bottoms, but it requires two or three years for them to mature ready to put on fat.

THE PRECESSION OF THE BREEDS.

HOGS of the best blood of the time came to California in 1853, being included in the efforts for improved farming in that year. After satisfying demonstration of the success of this movement, the State Board of Agriculture in 1860 published this memorandum:

Seven years ago a few men saw the peculiar adaptation of our climate to the rapid development of animal existence and hence the richness of the field for the rearing and improvement of stock. They purchased at great expense of time and money, in distant portions of the earth, at great risk, a few choice specimens of blood cattle, horses, sheep and swine. Their growth and tendency to multiply more than verify the predictions of the projectors of the enterprise.

This importation was not by association; it was a group of individual enterprises in which many entered in their own ways. Contemporary records show that the breeds of hogs thus brought to the State were Westphalia, Bedford, Suffolk, Berkshire, Essex, Yorkshire, Leicester, Chester White, Irish Grazier, and China. All these were shown at fairs previous to 1863. We regret that we have no space to record the names of the pioneers who were exhibitors nor the interesting claims which they made for their favorite breeds, but we can assure our present-day readers that when it comes to making claims for breeds of hogs, they have nothing on their grandfathers. We cannot, however, exclude this general claim, officially made at the San Joaquin Fair of 1861:

The 46 hogs of pure breeds, Essex, Suffolk, Berkshire, and Chester White, exceeded all previous exhibitions in the State; indeed, could hardly be surpassed even in old England.

It was war-time in 1861 and patriotism reached even to pigs, for J. D. Patterson of Alameda county exhibited: "Union Pigs, a new breed, product of an Essex boar and a Leicester sow, three months old and looking well." It was quite the habit of the time to cross the breeds and expect much from it, which, of course, was not realized.

It is interesting to note that the color question in breeds arose very early. In 1860, Carey Peebles of Santa Clara, who had purebred Suffolks, Berkshires and Essex, and was hogging-off grain with them, said that "the Suffolks are most profitable in the pen but they suffer when allowed to graze. On account of their thin hair they get sun-burned and have a mangy appearance." This decision against the white hogs is frequently repeated in subsequent records.

Out of the contest of the many breeds cited above the Berkshire and Essex emerged as victors, in part on account of color, and later the Berkshire distanced the Essex largely because of superior size and range quality. Thus the Berkshire survived as champion over all the breeds introduced with it in 1853—most of which were utterly forgotten. Keeping pace with the development of the breed at the East and in England by scores of large importations by different breeders, the Berkshire armed itself for the contest with the more modern breeds of American naming, which is still on in the California swine world. Of these new breeds the earliest to arrive was the Poland-China—the first Magie hogs being shown by Moses Wick of Butte county in 1872 and the next year by several breeders. A few years after, Poland Chinas began now and then to beat Berkshires and Essex in classes open to all, though the Berkshire still held the lead in such tests. Even the arrival of the Duroc or Jersey Red, by several importations in 1885, did not shake the Berkshire in open sweepstakes and dropped from notice until re-introduced as the modern Duroc-Jersey by H. P. Eakle Jr. in 1905. The Berkshire and Poland China rivalry began its interesting course during the '80s and

still continues. Of the present issues between the breeds and the re-entry of white hogs we do not speak. Interesting facts by other writers may be found in this issue. Though the large importations of 1853 left only one entry for the present contest of the breeds, it was profitable in money to all who invested in it and it must have done something to lift the "common hog" of California today above the characters of the "native stock" which Americans received from the Spanish regime.

HOW THE GREASED PIG GOT AWAY.

ONLY once in nearly seventy years has the California producer gained a hold upon local consumption of pork products, and then it was a tail-hold which quickly slipped off. Of course the purpose of spending so much time and money to get the best hogs in the world in 1853 was to save the gold which was being sent away to pay for importations. And it took some bravery to entertain such a purpose. There were plenty of knoekers and croakers who shook their heads and said the "climate was too hot"; "there was no clover except in winter when hogs lived on corn"; "hog meat grown in this country would not keep," and one pessimist settled the question to his satisfaction by claiming "the baked soil of summer renders it difficult for hogs to root well." And yet brave men flouted all these discouragements and answered them by doing things which it was said could not be done. The details of such achievements before 1860 are exceedingly interesting, but we have no space for them. They demonstrated that the best hogs did better, in prolificacy and early maturity, than they did in the places whence they came; that barley and sorghum grain is as good as corn; that alfalfa is the best clover hogs ever grew upon; that the cured meat from well-bred and well-grown hogs is exceptionally good and keeps well, and they reduced the importation of salt pork from 51,169 bbls. in 1853 to 29,444 bbls. in 1859. "Thus it is seen," said John Bidwell in that year, "that as we become able to supply ourselves with necessities the importation of them declines." And during the next few years this truth became more apparent and in less than a decade, H. D. Dunn wrote in 1867:

With the exception of a comparatively small quantity of salt pork, hams and sides, mostly imported in brine from the Atlantic ports, the domestic production supplies the home demand. But a few years will pass before importations will cease entirely and California become a large exporter of salted and cured meats to countries on the Pacific and to the interior.

It was then that they had the pig by the tail and something slipped. In fact two things slipped in the latter '60s: The war contracts were no more, the pork packers of the Central West had too much product and the overland railway opened. In 1867 Dr. Holden said, in his address at the Stockton fair, these words:

Mr. Hancock, of Cragin & Co., Chicago, who was here recently, told me his firm, on taking stock a year ago, had on hand 71,000 bbls. of pork worth \$3,000,000 and bacon worth \$500,000. That is the way our Chicago neighbors do business!

It apparently occurred to Dr. Holden that the words of the enterprising Mr. Hancock were an inspiring incentive to local production, but Mr. Hancock was perhaps only the first of the procession of tired Chicago packers who have come to California since that time for recreation and have amused themselves with good strokes of business. Some of them have built up good local packing establishments and have been a great help in getting the California meat industry as far ahead as it now is. Perhaps they have done all they could do profitably and we are not asking them for more, but the fact remains that the pig our fathers hoped to catch got away and never again has the swine industry come so near to compassing the local demand and the hope of exports as it did just half a century ago this very year!

WHAT SORT OF A GAME SHOULD WE PLAY?

IT IS easier to say what the game should now be than to tell how to play it. The basic facts are that we have as good purebred hogs in this State as there are in the world; we can

grow more good hog feed for less money than any other hog-growing State can grow; we are buying, they say, fifteen million dollars' worth of packing-house products a year from other States which have no better hogs to get sires from, and worse climates for feed, growth of hogs and packing operations, and yet we are the worth of two dreadnaughts away from supplying ourselves, the worth of a whole war fleet away from what we should be selling beyond State lines, and worse off in these regards than we have been for half a century. It surely has been a slow game!

How can we play a better game with swine? We set it up this way:

1. Grow more good hogs.
2. Pay more money for good hogs than bad.

3. Pack California products under California labels.

4. Make our own people know that California pork products are as good as California oranges, raisins, prunes, walnuts, etc., by educational advertising.

5. Make the outside world recognize the same facts by similar effort and get our share of exports.

How shall the game be played? We do not know exactly, but the chief moves are these: organization, agitation, education, and legislation. It cannot be finished in a day nor in a year but it can be started in a minute in the heart of every patriotic Californian, for its benefits will accrue to every one who has citizenship or investment in this State!

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Too Many Millipeds.

To the Editor: For 10 years I have had a flower garden and just that long had trouble losing my nice flowering plants as soon as they get well started—especially carnations and stocks. The plants wither and die, and when pulled up I find the roots like those I am sending for examination. I also find little worms of which I enclose a few in the small paper box, and some very small white insects. The ground is full of these worms, but they don't bother dahlias, cannas, callas, verbenas, pansies and daisies.—Reader, Elk Grove.

Your pest is the common milliped (Julus hesperus), a small edition of the great thousand-legged worm which looks so formidable with its cylindrical form, shelly coat and legs too numerous to mention, which you may find under fallen leaves, etc., in moist places. The small julus is a lot worse pest than the big one. Go on growing the plants which they do not like just as you like and put the plants which they are apt to injure in a piece of new ground if convenient. If not, dig over one of the beds or borders loosely, letting the heat and dry air penetrate as much as possible for a month or more if you like. Then wet it down well and plant out the carnations and stocks which you have grown for the purpose in pots or cans. Put a slice of potato rolled in Paris green in the ground near the roots of each as you set them out and the worms will probably be killed by the poisoned potato. Handle this poison very carefully. This is an old way of trapping these ground pests which are otherwise hard to reach.

How Much Alfalfa Hay per Head?

To the Editor: Will you kindly explain the difference in the amount of food required to feed a dairy cow, and a working horse, on alfalfa hay alone? The horse weighs about 1400 lbs. Which one takes the more feed?—Subscriber, Gilbert, Ariz.

There are experiments to show that horses of that weight have been kept well enough to get around in ordinary ways on 20 lbs. of alfalfa hay per day. It has also been shown that cows (presumably of ordinary weight and product) have kept busy on 30 lbs. per day. But these figures do not indicate that these amounts are best or most profitable in results—that depends largely upon the animal and what it is being kept for. Of course a cow will eat more weight than a horse and has a much bigger place to put it.

Protecting a Lawn.

To the Editor: Gophers are digging in our newly sowed lawn and in our lawn that was planted last year. Can you please tell me how to get rid of them?—R. A., Lincoln.

If your lawn is small enough or your love for it large enough to make the expense seem reasonable, you can fence both gophers and moles out in this way: Take chicken fencing, 2 ft. wide and 1-inch mesh, and snip it through the center into strips 12 inches wide. Dig a trench around the lawn and bury the strips vertically with the selva sides near the ground surface and the cut wires at the bottom. Kill any animals you may have accidentally fenced in as they show

themselves. You will have no more from the outside. You can do the same thing with 12-inch redwood boards if you prefer. Aside from such

By courtesy Calif. Hog Book.
Feeder for alfalfa hay; self-feeder for grain; and colony house
at the Farm of the University of California, Davis, Cal.

fencing out there is no way to keep out gophers except to kill them with gun, trap, poison or cats, as has been frequently described in our columns. If you have to deal with moles, and in lawns they are frequently mistaken for gophers, it is harder to get them because they do not expose themselves for a shot and do not take poisoned vegetables. They must be speared, when moving the ground, or trapped.

Cow-peas for Hay.

To the Editor: I am thinking of growing cow-peas for feeding horses. Would it do to feed cow-pea hay and no other hay? What is the yield of cow-pea hay per acre? I have plenty of water for irrigation. How many months does it take from planting to cutting for hay, also how many pounds of seed per acre?—N. E. A., Anaheim.

Theoretically, cow-pea hay should be fed with grain hay or with grain and will do well with barley, Indian or sorghum grain. Physiologically,

this is more important if the horses are doing hard work. Practically, horses not worked or driven hard will do well on cow-pea hay alone and it is better than much of the stuff such horses have to eat. Cow-peas have yielded from one to three tons per acre according to the variety and growing conditions—probably two tons should be considered very satisfactory. Sowing after frost the first pods may appear in about 90 days. Cutting for hay should be in the first pod appearance. There is considerable variation in seeding practice; good results have been had by drilling 30 lbs. per acre and by broadcasting 60 lbs. A beginner with cow-peas in California should start in a small way and get wise. The crop has many surprises.

Leather Waste Non-Agricultural.

To the Editor: Would you kindly advise us if you know of any market for leather cuttings or scraps? In making gloves there is always considerable scraps and leavings from the leather which contains a percentage of nitrogen and makes a fairly good fertilizer.—Subscriber, Napa.

They are recorded to have practically no agricultural value because the substances they contain resist decomposition indefinitely. Even leather meal, made from grinding dried scraps, may remain in the soil for years unchanged. The stuff can be reduced with acid, but we believe it is not done because there are better sources of nitrogen available. The material may have manufacturing value, but that is out of our line.

Non-Heading Cabbages.

To the Editor: Why are my cabbages going to seed instead of heads? They were set out in October on fine land and have had good care. The plants are large and thrifty but are seeding; a very few heads forming.—L. A. M., Puente.

There are two possible reasons—probably others. If the plants get too much of a setback and become too dormant some time after transplanting they seem to think their second growing season has come and they go to seed. Such dormancy might come from drouth or from too hard freezing. The cabbage should grow continuously from seed to head. If the plants were grown from seed from plants which made seed the first year, they are apt to indulge the same habit. Therefore it is essential to get good seed grown by a man with a conscience who will grow seed only from stock which he knows to be really in its second season. Your trouble then may be due to bad growing conditions (not covered by the good cultivation which you gave) and not the defective results of bad seed.

Cleaning Ditch Banks.

To the Editor: I have a number of lateral irrigation ditch banks overgrown with Johnson and Bermuda grass. What can you suggest to treat these banks with so as to destroy vegetation?—G. S., Merced.

Get a good, sharp, flat-footed weed cutter and start it to running about four inches deep on the ditch banks every Monday morning at five o'clock. Don't wait to see anything green: Keep your eye on the calendar and the clock and work by schedule all summer—seeing red all the time. If you do this you will have the cleanest, prettiest ditch banks in the San Joaquin Valley.

If you wish to try a weed-killing medicine, spray the ground with arsenite of soda one pound to five gallons of water—using a coarse spray or sprinkler so as to wet the ground well. This will of course kill all other plants and animals which it reaches in sufficient strength, and you must calculate your own chances of doing that.

Future of the Purebred and Market Hog in California.

[By D. O. Lively, Chief, Department Live Stock Panama-Pacific International Exposition, 1915.]

Sky-rocketing prices in the hog market makes every California farmer want to kick himself for not having a lot of hogs to sell. Rolled barley, the grain feed in general use in this State for finishing hogs, occupies a moonlike altitude, and the next best or rather the next used grain feed, milo maize, is flying along on a little lower level. Yet in the face of this there are many hogs being shipped to the California packers. At the present writing it looks, too, as if the highest level in both pork and feed prices has not been attained.

The discussion just now of a possible future of the purebred industry and business of selling hogs to the slaughterer is timely. The business of raising and selling purebreds, in the majority of cases, is in the hands of what may be, for want of a better term, classed as the aristocracy of agriculture.

The Typical Purebred Man.

The breeder of purebreds is a man who subscribes to the farm papers, advertises therein, takes and reads his regular breed paper and is a member of a breed record association and of the California Swine Breeders' Association. He has his ear to the ground and knows what is going on. He contributes to public sales, writes live news items for farm press, and is up and going in every way. His future is pretty well assured. In the natural order of things he will do a lot of business attracting more attention to the excellence of his herd and expanding as a business man should. He will exhibit at the county and State fairs; will be rigidly honest about pedigrees; if he is not, the rumor of his crookedness will get about and in a short time he will automatically go out of business.

In every State where the breeding of any character of livestock is a new industry unprincipled men are sometimes attracted to the opportunities of sharp practice and consequent quick profits. There is no line of business where double dealing will be more quickly found out than in that of cooking up or substituting pedigrees for livestock. Another ill-advised practice which sometimes attaches to breeding of livestock, and especially hogs, is to attempt to sell an entire litter for breeding stock. It requires a good deal of fortitude and knowledge of type to get a breeder in the habit of taking one-third to one-half only of his big litters to keep for breeding sales purposes. When a man pays from \$100 to \$200 for a boar and an equal amount for a sow, and then when a litter of eight or ten pigs is farrowed finds it necessary to only keep four as breeding stock, he must have that characteristic which is necessary for success. Neighbors must depend upon mail orders from that breeder.

Romance of the Swine Industry in California.

The swine industry has come to

California to stay. No State in the Union that has gone into the business of raising swine ever went out of it. In some of the hog-producing States the high-cost of feeds and land tenantry conditions sometimes cause the farmer to sell off his seed stock when high prices come, then followed a falling off in production.

By and large the business of producing swine is the most attractive and profitable industry in which a farmer can engage, and, taking that as a starting point, it is safe to say that the man who is in the game of breeding purebred livestock and follows a regimen of progressiveness and rigid honesty has an assured future in California.

According to a table recently prepared by the United States Department of Agriculture, there is only 3.58 per cent of the 68,000,000 swine in the United States purebred. So much for the purebred side of the business.

Pork Producing Side.

Now for the phase that is of equal or greater importance; i. e., the pro-

duction of hogs for the market. In this California is weak. With the exception of what may be termed the desert States of Nevada, Arizona, and New Mexico, there is no State in the Union that produces so small a percentage of the pork products consumed within its borders. Albeit there is no State in the Union where swine-raising can be carried on as successfully as in California. Climate, feed, and water, the three great requisites for successful hog culture, are in better combination in California than in any other State. It is needless to dwell upon the advantage of climate and water. No zero weather and low humidity give to the California hog-grower advantages that the man in the Middle States, who furnishes the present supply of hog products, does not possess.

California's Feed Advantages.

The Californian has advantages of feed possibilities that are not equaled elsewhere. He has alfalfa; he can raise any of the root crops; and he can take his choice of bar-

ley, milo maize, or any of the other sorghums, Indian corn, waste products of the vineyard, cracked beans, fruit windfalls or paddy rice. The Middle States hog raiser sometimes has alfalfa, but generally he depends upon corn alone. With such advantages the California farmer should find it difficult to stay out of the hog business.

The Fly in the Ointment.

The only fly in the ointment to a successful continuance for increasing the volume of market hogs in California is that of marketing. Judging by what has taken place in other States and sections of the country where hog growing is carried on under greater handicaps than here, but where marketing facilities are better, if there was a central livestock market at San Francisco, dominated by a livestock exchange, and a similar institution at Los Angeles, California would not only supply its entire home demand with home-raised pork products but would be competing with the Missouri River country for a part of the

auction sales of market hogs. When asked as to the advisability of such sales it developed that there were as many conclusions and minds of the packers as there are men at the head of such enterprises. One packer said he believed auction sales were the solution of the market problem. Another said that while the market was on the ascent, events such as these would prove attractive, but when prices got to tobogganning the breeders would be greatly dissatisfied with the results attained. Another packer liked the idea of having hogs delivered to his establishment. California is a large State, second in size in the Union. When the business of growing swine assumes the proportions that it will, there would be as many auctions each day as there are counties in the State.

This condition will apply at a period of time when feed is plentiful—after that there will be a famine of auctions. Buyers will be out of occupation, and there will be no continuity of supply or means of determining storage space in the cooling rooms or taking contracts for future delivery. When these auctions are held at times when prices are normal or low, there will be certain tag ends no packer will buy; this will prove unsatisfactory to the farmer and discourage him. The central market idea is bound to come, and it will only be a few years until there are stockyards at both San Francisco and Los Angeles. At stockyards the supply of hogs comes from a large territory. There is, as a rule, a sufficient supply to enable the commission man to sort and grade ages, weights and quality into separate lots. At stockyards hogs, sheep, and cattle are sold after being fed and watered, eliminating a large part of the shrinkage incident to shipping.

The co-operative system of

marketing hogs in California has attained some proportion. In Stanislaus county the Farmers' Union have made shipments of hogs, collecting them at Modesto or other shipping point, marking them by clipping the hair of the hogs of each consignor and sending them to market in charge of a market manager. Glenn county has a man who regularly represents the members of the Farm Bureau in the sale of hogs, sorghum grains, etc. The Imperial County Valley Farm Bureau is considering the employment of such a man. This method of marketing hogs is not new. It is in effect in a great many States, but elsewhere than in California the market manager ships his hogs to a commission firm, and larger offerings are obtained.

In California the market manager ships his hogs to some packer, regardless of whether or not he gets the top of the market. There is a lack of satisfaction in not having the bids of more than one buyer. The co-operative system of shipping.

Duroc Sow and Litter—the Dining Hour.

inter-mountain district and shutting out the States east of the Rocky Mountains from the trade along the Pacific ocean.

There is not space here to go into the various phases of the markets established in about twenty-five population centers in the United States—suffice to say these markets, their conduct and management are the outgrowth of an industrial need; also that similar markets will be established in California. They have been found necessary and profitable to the farmers tributary to the cities such as Portland, Spokane, and Seattle; and while the packers of California are divided about the need of stockyards for sheep and cattle, they are almost a unit in the statement that if there were stockyards there would be a better and more staple market for hogs.

Auction Sales.

Californians take a good deal of pride in the fact that they do things differently. Recently there have been pulled off in this State in one community two or more successful

Would Rather Have a Hog Ranch Than a Gold Mine.

The illustration below shows the Whitten Ranch method of pasturing the hogs. On each side of a long lane are grazing fields, all in alfalfa. There are about 30 fields on each side that are 2x20 rods, each large enough to contain 12 to 20 hogs, according to age. Farther on are several fields 4x20 rods, which will hold 40 young pigs each, but it is not considered a good plan to keep more than 20 together for any length of time, and not more than 12 after they are six months old. The hogs are turned into the different fields on one side of the lane, and remain until they have eaten all of the tender, juicy shoots of alfalfa, on which they thrive best. Then each bunch is transferred to its corresponding field on the opposite side of the lane, and the sheep are put in to crop down the stemmy alfalfa that remains. After this the fields are irrigated, and when the alfalfa is up again the hogs are returned.

The entire hog department is piped underground for water, and in each field is a trough with a float, so that the hogs have fresh, cool water at all times. Also, in each field is an inexpensive thatched shelter of straw, that affords protection from the rains in winter and the sun in summer. There are no wallows. When the herd was being established and animals were purchased that had been accustomed to wallows, they suffered considerably when deprived of them, but their pigs were never allowed to wallow and did not seem to mind the extreme summer heat and thrived better than those that had wallows. The long farrowing house shown in the picture accommodates 24 sows at a time. Each pen is 8x12 and has a guard rail all around to prevent sows from crushing their pigs.

Handling the Farrowing Sow.

A sow is put in a farrowing pen two days before she is expected to farrow, so that she may get accustomed to her new quarters. An attendant is on hand when she far-

Science and system should be given credit for the success of the Whitten Ranch, at Terra Bella, Calif., owned by R. H. Whitten of Los Angeles, who believes that the best farm implement is an office desk, and that the most effective tool is a nicely sharpened pencil. He has studied deeply, thought carefully, and planned wisely, and the result is an arrangement of buildings, fields, equipment and methods that keeps expenses to the minimum and profits to the maximum. Besides a large number of Holstein cows and Hampshire sheep, there are about 600 registered Poland-China hogs, of which Mr. Whitten makes a specialty.

rows, takes the pigs as they are delivered, and keeps them in a box (warmed if the weather is cold) until all have arrived, after which they are started nursing. After about ten days the sow and her pigs are moved to a colony house; three being put in each hog field. The Ames (Iowa) style of colony house is used. It has been found particularly suitable for this climate, as it can be closed tight and heated in winter, or thrown open so as to afford an abundance of shade in summer. There is a creep in each field, and in each creep a self-feeder is placed just as soon as the pigs are old enough to eat. By the time they are weaned (at eight weeks) they are eating so well that they hardly notice the removal of their mothers and there is no setback.

Ration for Growing Pigs.

The grain ration for the growing pigs consists of a mixture of two parts ground barley and one part shorts, and they are allowed to eat as much of it as they will until they reach about 150 lbs., when they begin to get too fat, and a filler of alfalfa meal is used at the rate of one part meal to six parts of the grain mixture. When good oats can be obtained, the amount of ground barley is reduced, and ground oats substituted. Also, a little ground milo is occasionally added for variety. At four months the pigs are culled, and those to be marketed are changed to a ration of two parts ground milo and one part ground barley—also fed in self-feeders. In addition to these grain rations, the pigs get a liberal allowance of skim milk; or, if there is not enough to

go around, tankage is substituted, and the pigs are given free access to it in the self-feeders. For roughage the pigs have green feed nearly every day in the year. In summer they have an abundance of alfalfa, and in winter they have barley, rye, millet and rape, which is disked in the alfalfa fields in the fall, and grows while the alfalfa is dormant.

A Good Hog Tonic.

In a separate compartment in each self-feeder is the Whitten Ranch hog tonic, which is compounded as follows: 8 lbs. charcoal, 8 lbs. wood ashes, 8 lbs. air-slaked lime, 6 lbs. salt, 6 lbs. bone meal, 2 lbs. powdered sulphur, 1 lb. powdered copperas. The copperas is omitted when fed to sows in pig, as it is apt to cause abortion. This tonic not only keeps the pigs in prime condition, but keeps them free from worms and enables them to make the greatest possible gains for the food consumed.

Records Food Consumed and Gains Made.

A careful record is kept of the food consumed and the gains made, and the average weight of Whitten Ranch pigs, month by month, is as follows: 1 month 16 lbs., 2 months 38 lbs., 3 months 64 lbs., 4 months 98 lbs. (cull all under 80 lbs.), 5 months 143 lbs., 6 months 185 lbs., 9 months 275 lbs., 12 months 365 lbs. Thus it will be seen that the pigs average practically one pound per day for the first year, the growth, of course, being confined to frame, bone and muscle, as the pigs developed for breeders are not allowed to put on any fat during the growing period. These weights represent the

average of all pigs not culled. The tops of litters of the biggest breeding often reach 450 lbs. in one year, and occasionally 500 lbs.

Rapid Growth of Poland-Chinas.

The Big Type Poland Chinas grow rapidly, and will finish off at any age (225 lbs. in six months if changed to a fattening ration), but they do not mature early. They keep on growing during the second and third years. Mature boars reach from 800 to 1200 lbs. and sows from 600 to 900 lbs. The dam of Mr. Whitten's leading herd boar, Jumbo Model, weighed 960 lbs. and the sire 1085 lbs., and the young boar is expected to mature at over 1100 lbs. Yet, notwithstanding this tremendous size, the Big Types of today have all of the smoothness and easy feeding qualities of the short, chubby types so popular a few years ago, and, if fattened, are ready for the market at a much earlier age and at a lower feeding cost. The culls that are to be marketed are confined in an enclosed feeding pen with a cement floor, and are fed a ration of three parts ground milo and one part ground barley; to this mixture is added tankage at the rate of one to nine, and alfalfa meal one to six. The records show that to make 100 lbs. gain it requires 270 lbs. grain, 30 lbs. tankage, and 50 lbs. alfalfa meal.

The grain not grown on the ranch was bought at an average cost of \$2 per 100 lbs., so it is now costing approximately \$6 per 100 lbs. to fatten the hogs. They are now bringing \$12 right on the ranch scales, without allowing for any shrinkage, so the profit, not counting the labor, is \$6 per 100 lbs., or \$12.25 per hog. Who says that hogs do not pay—even when raising them for the market alone?

Mr. Whitten swears by swine and system. He says that he would rather have a hog ranch than a gold mine, but he adds that brain work contributes more toward Great Success than all the results of arm and leg work put together.

The Value of Livestock to California.

A veteran Swine Breeding authority of Illinois gives our readers valuable suggestions after looking over the stock situation in California.

[Written for Pacific Rural Press by A. J. Lovejoy, Roscoe, Ills.]

The writer has been asked to give his impressions of California as an agricultural State, and what I think of it as a livestock State.

From the viewpoint of a Middle West farmer of Illinois, I am free to say that you have many things in your favor for the growing of purebred livestock that we of the farther Eastern States cannot have, viz.: the climate, for one thing, where stock can be grown with less expensive shelter, and where the forage crops can be grown and fed the year round. Of course, it looks rather queer to me to find no good warm barns, or at least very few, on the so-called ranches. To us in the East, one of the first things we plan for is good, warm barns, where all stock can be sheltered from the cold which often is very severe. Zero weather and below is a very common thing with us, and no animal can thrive unless well housed. We build our barns with a double wall, leaving a 4-inch or a 6-inch space between them, and use heavy building paper on the sheeting of boards which cover the joists, and then add the siding over the paper, and sheet up the inside of the barn with matched flooring, making a warm, almost cold-proof building. We use heating tanks to keep the drinking water in the supply tanks from freezing, and much of the time we feed our young pigs, on cooked warm feed, during the cold months. You can use such feeds as carrots, sugar beets, turnip, and rutabaga, and all kinds of roots, which we cannot do without much expense unless we have warm root cellars or bury them below frost.

We have alfalfa, of course, and make good use of it, but cannot grow but three, and sometimes four cuttings a year as we have to leave a good growth after cutting to protect the roots and crowns for the winter.

You have a variety of feeds that we do not, in the case of hog feed, such as citrons, roots, and milo maize, the pomace from the wineries, etc. I do not think you have much grass for grazing through the winter months, as most pastures that I have investigated look very bare, and you have few silos, which we consider almost indispensable. We cut up great fields of splendid corn, when in the glazed state, and while the stalks are still green, run it through a power cutting-machine and elevate it into the silo where it goes through

the process of curing and comes out a very valuable feed, that is all eaten up clean and is our very best and cheapest feed for cattle, sheep, and in a small way for horses, and is also picked over by the hogs, though they eat only the softened grain and a little of the greenest leaves. It makes a variety only for the horse and should not be depended on for a general feed.

Swine Rations.—For hog feeding we depend mostly on dry feeds, fed in the so-called self-feeders, or what is called the cafeteria system, where every pig helps himself. When the right variety of feeds are placed in these self-feeders, we have found that the pig knows as much about balancing his rations as does the college professor. To get best results give him a variety of grains and also a little tankage or meat meal, which with some alfalfa hay—when there is no green feed—and the proper mineral mixture, and he will thrive amazingly. You never have any trouble from frozen feed or the freez-

abandoned farms there. We even plow under alfalfa or sweet clover for the good of the soil. I think the time will come, to even California farmers, when the soil will need better care by establishing a more permanent system of agriculture.

Meats to Be High-Priced.—All meats are now very high in price, and probably always will be, as the country is fast filling up with consumers and we will never again see low prices. I believe that a good dairy, in conjunction with well-bred hogs, will add much to the annual income of the average ranch or farm, and also the growing of beef cattle is a good business, where proper grazing land is to be had. Why not grow more beef and mutton—both are very high now and will continue to be for many years.

The State Farm.—See what your California College farm at Davis has done for California. It has put the State on the map of the world by growing the best fat steer, the grand champion, as well as the reserve champion of the U. S., and has also bred, grown, and fed the best fat wether. I think the people of California do not realize what this means

Berkshire Sow and Litter at University of California Farm, Davis, Calif.

ing of the water.

Favorable Conditions.—I have visited a number of ranches here and find good stock, and that they are given good care and careful attention, and all stock looks well and very thrifty. You can grow fall pigs better, and make larger growth in this State, than can we of the Middle Western States. All in all, I am much pleased with California as a livestock State, and cannot see why every ranchman should not make livestock a prominent part of his business, even though he grows oranges and lemons, in part.

Keeps Up Fertility.—Livestock will do more to keep up the fertility of the ranch than anything else. One can save the purchase of so much commercial fertilizer and at the same time the land is growing better year by year. We in the East are very particular to farm our land so the fertility is growing better each year, instead of putting nothing back on the land, and gradually wearing it out. We do not intend to leave any

to the State. These prizes were won at the International Live Stock show at Chicago in 1916, competing with stock from all countries and with the best to be found. Your legislature should be proud of the work done and liberally appropriate the money to build a still greater State Agricultural College and Stock Farm. Illinois gives its Agricultural College, by vote of the people, a one-half mill tax on the dollar and it means something like four million dollars bi-annually, if I am not mistaken. We have always been very liberal with our College of Agriculture and our State Fair, and it has made Illinois stand out very prominently in these departments. Why not California? Your people have the knowledge and the enterprise, but need help from the State to accomplish greater results. After all, agriculture is the basis of all wealth.

Cold weather has retarded pastures in Monterey county.

THE PORK PROBLEM IN CALIFORNIA.

[Written for Pacific Rural Press by Cuthbert Powell.]

The demand for fresh pork in California is steadily growing with the increase in population and the substitution of the high grade and purebred hog for the scrub, giving us a better finished and more profitable hog for the packer. With better hogs packers are encouraged to enlarge the pork end of their business.

We have great diversity of crops here, two or three of which may be raised yearly through our irrigation system, enabling a ranchman to raise a few hogs at minimum cost. Alfalfa is a great growing feed for young hogs but should not be relied upon exclusively. Sorghum is a good hog feed and grows abundantly on certain soils. Sugar beets too can be fed to advantage mixed with other feeds, and their yield per acre is heavy. Barley grows well in this country, and is a good feed both green and dry. Refuse beans may also be used in the hogpen fed with other stuffs. Above all, corn should be used to top off with. Nothing takes the place of corn as a finishing feed. Corn can be grown in many places as a second crop and enough raised to finish your hogs with during the finishing process. Barley could be planted in the fall and when cut in the spring or early summer, the same ground may be put in corn. Pie-melons may be planted with the corn, and in this way three crops are raised, all making good hog feed. The pie-melons don't begin to run until after the corn has been "laid by."

Hog raising in California is a success managed along these lines if the same close attention is given it that is exacted by any other successful business. In the corn States of the Central West, where corn is the main feed, hog-raisers make their hogs weigh 250 to 300 pounds by the time they are eight to ten months old and produce a hog with 70 to 75 per cent net meat. Hog men in California should strive to attain the same results. That hogs of the Central West get better prices than California hogs on the markets here on the coast is due to several causes. Hogs sent to the Kansas City or Chicago market are either high grade or purebred and fed corn from infancy, and kept growing at the top notch from start to finish. This produces the best type of hog. It costs no more to feed and fatten a high-grade or purebred hog than it does a scrub and he responds more readily to everything that he eats, and is put on the market in good shape. This, with the fact that the hog raiser of the Central West has a broader market, accounts for the higher prices that are paid for hogs on the Kansas City and Chicago markets. Packers of these cities, too, are enabled to utilize everything about the hog save his squeal. With small packers this result is not always possible, but even when it is, the offal of 1000 to 1200 hogs per day can be handled more cheaply and to greater advantage than that of 100 to 200 hogs per day, which generally represents the daily killing of most packers here on the coast.

The Eastern packer has also an unlimited demand for his product, with the incidental advantages.

Hog Feeding Problems and Difficulties.

[By Prof. J. I. Thompson, University Farm, Davis.]

What to feed for pork production and how to feed it is often a problem. Grain is seldom relatively low in proportion to the price of pork, so that careful attention to the ration and to the manner of feeding is absolutely essential to success financially. Granted that the pigs are reasonably healthy and sufficiently well bred to be vigorous and capable of growing, the question arises:

1st. Shall the pigs be carried along on grass alone until the grain stubble is available? or

2d. Shall a limited grain ration, say two lbs. of grain for each 100 lbs. of pork, be fed in addition to the pasture and the hogs finished on stubble fields or in the dry lot immediately afterward? or

3d. Shall a heavy grain ration be fed from the beginning, with pasture when available until the pigs are ready for market?

There is no question but that some pasture is necessary for the most economical production. Recent experiments conducted by the University indicate that the first plan, pasture alone for the entire grazing season, using grain afterward to secure sufficient weight and finish, actually requires more grain than does the third system, where a full ration is fed continuously. If this is true the only question left to decide is whether a full grain ration or a limited one is conducive to the better results. This is not a question that can be readily decided experimentally, for all pigs in an experiment should be uniform in type, breeding, etc. Pigs best adapted to handle a heavy grain ration are not well adapted to a decidedly limited one when economy of gains is the main consideration. For example, pigs grown for generations on a very limited grain ration lose much of their ability to consume a heavy grain ration. Comparative results when a medium grain ration is fed against a heavy one seem to offer the best solution.

When self-feeders are used the ration is, of course, the maximum that the hogs can eat. A summary of all the results with self-feeder lots shows that pigs so fed gain more rapidly than those fed a limited ration. But still more important is the fact that less grain is required for each pound of gain. This, then, would seem to be the answer as to the desirability of the system. The most economical system must be the one that requires the least feed for each pound of gain and gets the pigs to market the quickest. Both of these requirements are secured by the use of self-feeders. It would seem logical to conclude, therefore, that the more limited the ration, the less the economy. There are just two factors to be carefully considered before adopting this system for feeding market hogs. One of these is: The hogs must have the ability to handle a heavy ration efficiently, and the second is: The pigs should be farrowed at such a date that when ready for market in the earliest possible time they will not arrive at that time of the year when the market is most liable to be overloaded.

The feeds used should be home-grown so far as is consistent with economy and rapidity of gains. The pasture should be alfalfa if possible. If not, clover, rape or sudan grass for summer, and for winter whatever will grow well. This generally means barley, rye or rape. Alfalfa hay, alfalfa meal, or mangels, where they can be grown economically, will be found useful when pasture is not available. Skim milk in the proportion of three pounds to one pound of grain is very desirable, but not absolutely necessary. Good whey for pigs over seventy-five pounds weight can be used effectively. Tankage is a desirable substitute for skim milk for brood sows and pigs, and other feeds high in protein, such

received has, in most cases, been unsatisfactory, due principally to the fact that a ration of one part of barley to three parts of alfalfa meal is too bulky for a growing pig.

Is it any cheaper? 100 lbs. of barley contains 79.4 lbs. of digestible material, which amount divided into \$1.80, the cost of 100 lbs., gives 2.25 cents which is the actual cost of each pound of digestible material in the barley that is utilized by the pig.

In 100 lbs. of alfalfa meal there are 50.7 lbs. of digestible material. Divide this 50.7 lbs. into \$1.25, the cost of the 100 lbs., and we get 2.45 cents as the cost of each pound of digestible material utilized by the pig from the alfalfa meal. This

Hog Houses and Hogs on State Farm, Davis, Calif.

By courtesy Calif. Hog Book.

as coconut oil meal and linseed oil meal, may be used to advantage by pigs being fattened for market. Barley, milo, Egyptian and Indian corn do and probably always must constitute the major part of the grain ration.

It is perhaps no more important to know what feeds are desirable than it is to be able to figure what the relative values are. In order to determine this the amount of the feed that is digested must be known. One example will suffice: When barley is quoted at \$36.00 per ton and alfalfa meal at \$25.00 per ton, it would seem that the latter is much the cheaper, and many people who formed this conclusion have attempted to feed this meal in place of much of the barley. The growth

means then that barley at \$36.00 per ton is actually cheaper than alfalfa meal at \$25.00.

A ration of three pounds of alfalfa meal to one pound of barley at the above figures would cost 9.6 cents for the digestible material, while one pound of alfalfa meal and three pounds of barley would cost 9.2 cents, a saving of practically one-half cent, and the latter ration is much more efficient because it is not so bulky.

The American Berkshire Ass'n has provided \$1200 special premiums for the National Swine Show to be held at Omaha, Neb.; and the Nat'l Swine Growers' Ass'n has offered \$800 for Berkshires at that show, according to Sec'y F. S. Springer of the Berkshire organization.

Do You Feed Hogs?

With the present feed prices the big essential for profit in hog raising is a proper feeding method. It is important that the ration be well balanced and contain in proper proportion the food elements necessary to rapid growth and development.

Digester Tankage

is a supplementary feed, designed to make up the protein deficiency in ordinary feed.

It develops bone and muscle in young pigs and makes them grow. It matures hogs for market two or three months earlier than grain alone, and makes the kind of pork that commands the top market price.

It fortifies and strengthens the system and enables hogs to resist disease.

Swine Organizations in California.

[By O. L. Linn, Modesto.]

To build up any great industry, and especially where the individual contributors to that industry are essentially many, there is one thing that is absolutely necessary for the largest success and that is, to secure the willing co-operation of every individual within the range of influence of the institution to be established. Such has been the aim of those most vitally interested in building up a great swine industry in the State.

To do this it was necessary to have a parent organization to serve as a clearing house for the great work of bringing together on a common ground all the swine men of the State. Just such a parent the California Swine Breeders' Association became and a worthy "father," too, of every individual or organization of swine interests within the State; its objects being (to quote from its constitution) "to secure the co-operation of farmers and parties engaged in the raising of market or purebred hogs; to promote the business interests of its members; to procure and distribute the scientific and practical knowledge in all things relating to swine raising." This association has a just claim upon the hearty support of every swine man within the State no matter how small or in which direction his interests may lead, so long as he desires to see the swine industry in California made a real thing.

Then there are the individual breed organizations which claim the interests of their particular members according to their preference of breeds, and any man who is selfish enough to be concerned about his own welfare and those dependent upon him must needs belong. There is the Western Berkshire Congress whose particular interest is in the "Worthy Berks," and while its scope of influence is not limited by the bounds of the State, still its aims and purposes are identical with those of the parent organization and its hearty co-operation is assured for anything that makes for "more and better hogs in California."

Another worthy son of a worthy parent is the California Poland China Association, which has been recently launched. Here again we find an organization of royal boosters who have joined their efforts in winning for "The American Hog" his rightful place in the list of popular breeds in California. This organization has undertaken a worthy task and every Poland man within the State should volunteer his hearty support.

Then again steps have been taken to organize the men of the "Auburn Hog" proclivities, and while this organization, owing to the serious illness of one left in charge, has not been fully worked out, it is only a question of a short time until such will be done, for (to quote from one of these men), "The Duroc breeders realize that some such step is vitally necessary."

Then there are the various smaller country and district organizations, such as the Stanislaus Duroc Association, the Southern California Duroc Association, the Kings County Poland China Association, the Poland

China Breeders' Association of North San Joaquin Valley, and the Glenn Co. Berkshire Ass'n. All of these make their particular claims upon the breeders within their influence, and while it is not necessary for a breeder to belong to all, he should send in his application at once to the State organization and to the particular breed organization in which he may be interested.

Below are given the names and addresses of the secretaries of such organizations:

The California Swine Breeders' Association, Prof. J. I. Thompson, Davis, Sec'y.

The Western American Berkshire Congress, Arlington Smith, Visalia, Sec'y.

The California Poland China Breeders' Ass'n, R. H. Whitten, Sec'y, 610 Security Bldg., Los Angeles.

Southern California Duroc Association, R. K. Walker, Sec'y, Fontana. Stanislaus Duroc Association, Elmer Lamb, Sec'y, Ceres. Those interested in a State Duroc Association should address W. W. Everett, St. Helena.

FUTURE OF THE PUREBRED AND MARKET HOG.

(Continued from page 420.)

even in California, is a big improvement over selling to the traveling speculator. An instance of marketing direct as against selling to a speculator is shown in a California county within the last three weeks. A traveling buyer paid one man eight and one-half cents for a lot of choice, prime-fed hogs; he went over to a

neighbor and bought a lot of hogs of a lesser quality for 9½ cents; his third call was on a farmer posted on the market, who told him if he wanted his hogs at 10½ cents he could have them. The buyer paid the price. If all three of these farmers had combined and shipped their hogs to market they would have received twelve cents, which was enough to pay the freight and stand the shrinkage and leave a good margin beside.

Summary.

To sum up: (1) The business of producing purebred hogs in California may be considered as firmly established. It will grow naturally. The business of producing hogs for the market is an integral part and fixed feature of California agriculture. (2) The difficulties with

which it is now surrounded, the chief of which is the lack of marketing, will be adjusted. (3) The farmer who has been giving consideration to engaging in the hog-growing industry can make his investment with an assurance that it will pay him better than anything else.

Mr. Hog Raiser:

Here are some facts worth knowing. It does not pay to feed hogs by guesswork. Alfalfa fed hogs bring less on the market than hogs fed a balanced ration. A balanced ration produces firm meat at less cost and puts on more weight sooner and at less cost than any other feed you can use.

Feed Your Way To Success BY USING

Besgrade Hog Feed
Besgrade Brood Sow Feed
Besgrade Pig Feed

all of which are prepared from highest grade of Meat and Grains, balanced in just the right proportions to produce maximum results at a minimum cost.

We have found the leak in hog feeding and have assisted many of the now successful hog raisers to realize the highest market price for the least cost. Can we help you? Drop a line tonight and let us give you some inside facts worth money to you—FREE.

Economy Stock Powder

Conditioner: Worm Expeller: Disease Preventer:

For: Horses, Hogs, Cattle and Sheep

Not a Stock Food, but a Medicine. Not a Panacea, but a Remedy. Not a Medicated Salts, but purely a Medicine composed of the very best and choicest of Herbs, Roots, and Sodas. Not a Cure-All, but a genuine conditioner containing TEN different ingredients, scientifically compounded. No Oil Meal, No Bran, No Salt, No Poisonous or Harmful Drugs or Stimulants, such as Arsenic or Black Antimony that will create a false appetite.

Time will prove whether an article is good or bad. Economy Stock Powder has stood the test of time. It is no longer an experiment but a Compound of proven merit. Over 200,000 Farmers and Stockmen are feeding Economy regularly. A trial will convince you.

Economy Germicide Dip

Disinfectant --- Germicide --- Antiseptic

Will absolutely rid your hogs of parasites, lice, mange, scurf, and improve the coat of hair. Will not injure the eyes of the animal.

Poland Chinas, the American Hog

By W. Bernstein, Hanford, Calif.

At the recent organization of the California Poland-China Association, Mr. Bernstein was elected its first president. A. M. Brown, Sec'y of the National Poland-China Association, writes that "Members are indeed fortunate in having such a leader."—Editors.

Poland Chinas, the great American breed of easy-feeding, early-maturing swine, have led all breeds in the manufacturing of high-price pork at the least cost.

The breed was not fashioned after any hog ever seen in the world before. It had new qualities, new possibilities, a new form, and was not only a new hog, but pre-eminently the result of the environments of the American corn belt. In short, the breed is distinctly entitled to that slogan which now bids fair to become so popular, "Made in America."

Poland Chinas have carried the banner in popularity the past year as indicated by the high averages at public auction. Bred sows have sold at \$500.00, \$600.00, \$910.00, and \$975.00 per head and reports from their present owners state that they all farrowed large litters and are raising nearly all of them. We would not have our readers think that we encourage high sale averages, but the competition as was demonstrated for these sows indicates expressly the appreciation of the sterling qualities of the "Made in America" breed of swine.

The Poland-China was distinctly the result of the constructive breeding ideas of the American corn belt farmer. Breeds of many colors and different forms and characteristics were used in connection with the common hogs of the corn belt country, to produce the Poland China. In no predominating degree did the breed owe its form, conformation, and easy feeding qualities to importations, nor to any one of the numerous breeds and kinds of hogs used in the making of the Poland China.

It was about 1816 that a Shaker colony in Miami Valley, Ohio, then the chief corn producing section in the United States, began to breed the large white "China" hogs. Up to about 1845 these were crossed with various breeds, including the White Russian, White Byfield, Irish Graziers, Berkshires, and others. The effort was to produce the thick slabs of fat pork especially demanded in the Southern States. The type was emphasized, but not the color. These hogs during that period were raised in woods and farms far and wide surrounding Miami Valley; and when over a year old were driven down to this pioneer "corn belt" to put on the required fat. They were big boned, long, and deep, a type that held favor until late in the century. Since about 1870-1880, all colors except black with six white points have been bred out of all except the spotted strain.

The name "Poland-China" was adopted in 1872 at the National Swine Breeders' Convention. The breed had been known by a dozen different names based on localities where it was produced and on breeders who had been prominent in developing and fixing the type and advertising it at shows, etc.

From 1845 to 1877, improvement seems to have been by selection only, with no other recognized pure breeds being used. In 1877 the Ohio Poland China Record Association was organized. Next year the American Poland China Record Association was organized. In 1906 the National Po-

The wide dissemination of the breed outside of the corn belt in territories known as the south, southwest, west, and northwest, has been the most remarkable epoch in the way of breed extension the Poland China has ever seen. The growth in popularity of the breed has doubtless been greatly assisted by large num-

Typical Poland-Chinas.

land China Record Association was organized through combination. In 1887 the Standard P. C. Record Association was organized. Animals registered in one of these are eligible to all—a great duplication of work.

The small fine-boned silky type of Poland China began to appear late last century, but is not now widely bred. There are also the "medium" and the "spotted" types of Poland Chinas; but the great majority are bred to the large type of the earlier days of the breed. This long fixing of type makes the offspring of Poland Chinas of remarkable uniformity within each type.

The beauty of form and contour of the Poland China, emphasized by its present massiveness, is the type first set by the originators of the breed. It has been the one which received the stamp of approval, and has always had the support of the corn belt farmer of this country.

It is the form and type toward which all lard hogs in America have been working, and the success of any breed in this country, can be measured by its approach to the type of hog first seen in the Miami Valley.

bers of corn belt farmers who have settled in these territories. It is noticeable, however, that the quick growth and easy feeding qualities have commanded favorable attention from a great many people in these sections who were formerly bacon hog advocates.

California until a few years ago was conceded to be a bacon hog State; but present records indicate that the lard type predominates. Farmers and breeders are finding that the Poland Chinas make good every claim made for them, and are adapted to the conditions and feeds of California.

The Record Associations can testify as to the popularity of the Poland Chinas in California, where but a few years ago only an occasional pedigree was received for record, and today on every mail pedigrees are received from substantial, aggressive farmers and breeders.

Secretary A. M. Brown of the National Poland China Record writes me: "It is very gratifying indeed to see the interest shown in this breed by stockmen of the Pacific Coast and particularly California, which State can well boast of the interest and enthusiasm of its Poland-China breeders."

Dr. J. A. Crawshaw

HANFORD,

CALIF.

POLAND CHINAS

This grand breed of hogs, THE FARMER'S KIND, has been bred on my farm under my personal oversight for many years. The result is a herd of hogs that win 1st Prizes, Championships and Grand Championships wherever shown. Better than this they are all individuals of strong constitution, good bone, wide sprung ribs, splendid hams, straight, smooth and right in every way. They are easy keepers, coming to market weight and condition at six months of age. They make a profit as a market pork hog under present conditions of high feed prices. Years of experience convince me that they are the best hog for California conditions and that they are in every way

The Hog for the California Farmer

TWO OF MY HERD BOARS

SURPRISE,

First in Sacramento, 1916; first in Hanford, 1916. Sired by Gold Coin, who was third at San Francisco, 1915. His dam was Lady Style, who was fourth at San Francisco, 1915.

CHIEF'S VICTOR,

Champion and Grand Champion Sacramento, 1916; second at San Francisco, 1915. He is a half brother of Banker's Boy, my great boar that won first at San Francisco, and which I sold to Anita Baldwin for \$1000.

Herd Boars

I have five distinct strains on my farm, each headed by a boar that is of championship stock. You can pick from my herd just the blood lines and breeding that you need to start or add to your herd. I can at all times supply your needs at prices that you can afford to pay.

Visitors Welcome

My farm is located near Hanford and I shall be glad to welcome you and show you as fine a herd of Poland-Chinas as there is in the State. **COME AND SEE.**

MISS BEAUTY,

This sow was the champion at San Francisco in 1915 and champion at Sacramento in 1916. Her sire was Hustler, who was first under six months and first in young herd at the International Stock Show, Chicago, 1912. Her dam, Black Beauty, won first in 1909 at Sacramento, at Oregon State Fair, at Portland, and at the A.-Y.-P. Exposition, Seattle.

Breeding Sows

Every sow that I keep for breeding is of as high a quality as the boars to which I breed them. The result is to be seen in large litters of strong, active pigs that start right and grow rapidly into the fine prize-winning kind of hogs. The kind you want.

Foundation Herds

I can furnish foundations of unrelated strains, all of champion and grand champion stock and shall be pleased at all times to figure with anyone on costs. This is the way to **START RIGHT.**

M. Bassett

HANFORD,

CALIFORNIA

Poland-China Notes

These notes are taken from reports of Poland-China breeders sent us by request for this issue. We wrote to every breeder of whom we had knowledge. All did not respond and some reports are not entirely complete. However, we believe that on the whole they give a good idea of the amount of breeding stock and the blood lines in the State.

C. A. Stowe, Stockton, 7 sows, breeding not given. Herd boar not given; 40 head young stock.

Packwood Farm, W. F. Mitchell, Visalia, 4 sows, Silver Boy, Chief Picture and Candy Kid breeding.

T. E. Gilkerson, Lemoore, 5 sows Chief's Laddie breeding. Herd boar A. Wonder A., grandson of A. Wonder.

V. O. & T. R. Carlisle, Sanger, 30 sows, breeding not given. Boar, Wahtokey Chief, grandson of A. Wonder.

J. L. Lane, Hanford, 10 sows medium type, Bassett and Bernstein breeding. Young stock 20 boars and gilts.

T. H. Beckman, Lodi, 12 sows, blood lines not given. Herd boar, Lodi Boy. Young stock, 20 head boars and gilts.

Dimmick Bros., Lemoore, 6 sows of Chief Picture, Gold Coin and Chocolate Drop breeding. Young stock, 30 head gilts and boars.

Geo. V. Beckman, Lodi: 30 sows (breeding not given). Herd boars, Panama Knight; (2) Foxy Boy of 2nd prize sow at P. P. I. E. Young stock, 20 head.

J. McKindley, Acampo, 4 sows of Wonder, Lady Darkness and Meddler breeding. Herd boar, Chief Wonder, sired by Young's Wonder out of Lady Price.

W. T. Dice, Fowler, 8 sows of A. Wonder and Silver Boy breeding. Boar, Princess Lad, of Meddler and Hanford Chief breeding (first prize at Hanford Fair).

C. Gatewood & Son, Fresno, sows (number not given) of Big Joe, Blue Valley and Giantess breeding. Boar, Black Favorite, by Our Orphan out of Big Knox Girl. Young stock 20 head.

University of California, 12 sows from Expansion and Perfection foundation. Herd boars, (1) Big Bob Orange 3rd; (2) Meritorious (4th prize senior pig at National Swine Show 1916).

Deacon Ranch, Davis, 4 sows of Big Jumbo, A. Wonder, Meddler, and Perfection breeding. Herd boars, (1) Longfellow's Model; (2) Victor Chief. Young stock, 7 gilts and boars, and spring pigs.

California Polytechnic School, San Luis Obispo, 6 sows of Clymers, F. M. Darkness, Sunrise, Hillcroft, Hero, and Perfect I Know breeding. Herd boar Panama Chief. Young stock, 3 gilts and 6 young boars.

H. W. Ekholm, Escalon, 4 sows of Blue Valley, Good Enuff, Dude and Mascott breeding. Boar, Blue Valley Tecumseh, sired by Blue Valley out of Blue Valley Hadley. Young stock, 4 gilts, 2 boars and spring pigs.

J. M. Bernstein, Hanford, 10 sows, of Chief Picture, Big Mastiff, Candy Kid, Giantess and Queen Bess breeding. Herd boar President, son of Woodrow. Dam Giantess F.. Bred by Purcell. Young stock, 40 gilts and boars.

Rossmead Farms, F. D. Ross, Hanford, 2 sows of Warrior, Clymers, F. M. Darkness, Candy Kid and Silver Boy breeding. Herd boar Panama Black Jr., Champion at Oregon State Fair. Young stock, 60 head gilts and boars.

Bernstein's Ranch, Wm. Bernstein, Hanford: 20 sows of Big Chief Jumbo, A. Wonder, Nugget, Silver Boy, Warrior, Silver Baby, Long Model, and Candy Kid breeding. Herd boars: (1) Rosebud Chief 1st, (2) Lacy, sire King's Wonder, dam Candy Kid.

Reoaks Ranch, J. W. Hanna, Gilroy. 12 sows of Longfellow Lady,

U. S. Chief, Long Dude Up-to-date, Black Crow, Giantess, Big Surprise and Wonder breeding. Herd boars, A. Wonder and Dry Creek Wonder. Young stock, 12 boars and gilts and 96 spring pigs.

Dr. J. A. Crawshaw, Hanford, 12 sows, of Longfellow, Wonder, Long Model, Expansion and Big Orange breeding. Herd boar, President's Equal of Big Mastiff and Giantess breeding. 50 head of young stock. Spotted Poland Chinas, 2 sows. Herd boar, California Firsts.

Dr. T. B. Spaulding, Turlock, 5 sows of Chief Price, Big Ben and A. Wonder breeding. Herd boars, (1) Big Ben's Wonder by a Big Ben sire and out of an A. Wonder dam; (2) I. B. Wonder by an A. Wonder sire and out of a Smooth Price dam. Young stock, spring pigs.

Nate Hauck, Alton, 5 sows of A. Wonder, Giantess Longfellow and Blue Valley breeding. Herd boars, (1) Long Model by Long Wonder out of Miss Model 2nd bred by Fessenmeyer. (2) Cantrall's Ideal, sire Big Joe and out of Bessie Love. Young stock, 15 boars and gilts.

Chas. R. Hanna, Riverside, 3 sows, one sired by Thos. Walker's famous Blue Valley, one by a son of James' Big Orange, the other by Pacific Forrest. Herd boar (name and breeding not given). Young stock, 21 May to December pigs sired by Superba and 5 sired by Hanna's Big Bone.

W. D. Trewhitt, Hanford, 50 sows of Giantess, Silver Coin, Nugget,

Jumbo, Big Chief, and Gold King breeding. Herd boars, Jumbo Equal, sire Big Jumbo Equal. Dam Patsy C's A. B. (2nd prize P. P. I. E.) 2 Long Nelson. Sire Big Nelson, dam Big Surprise 2nd. My Choice, and Nuggett. Young stock not given.

Sandy Acre Farm, H. I. Marsh, 20 bred sows of A. Wonder, Giantess, Blue Valley, Big Bone and Hadley breeding. Herd boar, Model Major. First prize boar at Sacramento and grand champion at two county fairs 1916. Young stock not given. Just

Commoner Hog Ailments in California.

[Written for Pacific Rural Press by Dr. H. B. Wintringham.]

California taken as a whole is probably freer from hog diseases than any other State in the Union. This is probably due in part to the State's isolation and in part to the even climate found here.

Cholera probably ranks first in losses to pigs in the State. It is found universally, with a few exceptions, in some of the more isolated mountain sections where little or no pigs are brought in and the pigs are shipped out. There have been from time to time various so-called remedies placed upon the market for the cure of this disease and millions of money has been wasted in the purchase of these so-called but worthless cures. Vaccination is to date the only weapon we have for the satisfactory combating of the trouble. In territory known to have the disease every pig should receive the immunizing treatment very shortly after weaning. This will prevent its outbreak if systematically followed up. After pigs become sick the vaccination, though satisfactory, is not nearly so effective. Money spent for serum used in the vaccination is well spent whether for the prevention or the cure of the trouble.

Swine Plague or Contagious Pneumonia is a disease found here which seems to receive little attention as compared with the damage it does. It is often confounded with cholera. It is in the main confined to young animals housed in unsanitary quar-

ters. There seems to be a fallacy that any old place is good enough to be used for the housing of pigs, and no greater error was ever made, as from a financial point of view no animal yields greater profits than the pig from a small outlay, in good sanitary quarters. Sanitation and hygiene will do more for the control of this disease than medicinal remedies. Recently there has been put on the market a vaccine for this trouble which seems reasonable and should help to cut down the losses from swine plague.

Tuberculosis will always be with us in pigs, just as long as the same trouble exists in our dairies and the waste dairy products are fed to the pigs. The losses from this trouble to the grower are not directly as heavy as some other troubles, since the animals are marketed before its ravages have become severe enough to cause death. A simple process of pasteurization would overcome the greater part of this trouble.

Anthrax takes its toll in those sections where it is prevalent, but mainly through the cattle industry, as the infection in the majority of instances is caused by the hogs feeding on the carcasses of other animals dead with anthrax. The use of the new simultaneous vaccination will, if systematically used, prevent this loss.

Parasites play their part in the economic losses in pork production. Worms are probably the most important of these. There are very few hogs which do not harbor some of these insidious invaders. The systematic feeding of remedies for the destruction of these parasites and the keeping of the feeding floors and troughs clean and well limed will overcome much of this trouble. Lice are also always with us and by their irritation destroy some of the effect which the feed should have. A simple way to get rid of them is to establish rubbing posts which are covered with burlap saturated with crude oil. Another way is to cover hog wallows one-half inch deep with crude oil.

Footrot causing lameness and therefore loss is due to infected soil. Its remedy is to make the affected animals stand in a two per cent cresol solution for periods of ten minutes twice a day until the infection is under control.

Rheumatism may be overcome by keeping the sleeping quarters warm and dry and the pens well drained. Cold and dampness induce it.

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Calsen Poultry & Stock Food Co., Inc., Petaluma.

ANNOUNCEMENT!

To My Friends and Patrons:

Owing to the fact that my other interests demand all my time and attention, I have been compelled to dispose of my herd of Poland Chinas. I am pleased to announce that they have been purchased by H. I. Marsh of Modesto and will be combined with his Sandyacre Herd. Mr. Marsh is a well-known breeder and requires no introduction to Poland China men.

He will now have one of the largest and best herds in the State and I trust you will give him the same friendship and patronage you have given me and for which I thank you.

The Berkshire---Oldest of the Breeds.

[By Arlington M. Smith, Visalia, Secretary Western Berkshire Congress.]

Among the leading breeds of the swine family in America is the Berkshire. This breed is very popular on the Pacific Coast; its popularity increases each day. Berkshire style and finish, easy feeding and rustling qualities appeal to the imaginative and practical farmer; and the high dressing percentage, and quality and flavor of the pork make them a favorite with the packers. These things, together with the splendid bunch of boosters back of the breed in the West, are putting "Berkshires on every farm" with a rapidity that is astonishing.

As far back as 1789 this long hog was widely known in England and Scotland. The Berkshire is generally known as an English hog, though American genius has brought about wonderful changes and improvements. The aristocratic hog of today who turns up his nose at others of the swine family is very different from his old English ancestors of a century and a quarter ago, the most popular hog in Great Britain at that time. He was a large, rangy, reddish brown hog with sloppy ears. This reddish tinge still shows up in some strains of the breed, but it is nothing more than a sign of purity. Since that date Chinese, Siamese and Neapolitan blood have been freely used to establish a better type, but the Berkshire is still a hog with size notwithstanding the use of so much small type.

The breed originated in Berkshire County, England; and first importations were made to the United States (New Jersey and New York) as early as 1825. From this date the breed spread rapidly and grew in favor till 1855 when a "boom" was experienced and many new importations made. When the Civil War came to a close the Berkshire was the purest breed of swine in America.

During the last seventy-five years much improvement has been done by selection with few importations; and now it is said that the American Berkshire is superior to the English. This is probably due to the fact that the swine industry is carried on so extensively in the United States that exceptional individuals appear so much more frequently.

The Berkshire today is long, smooth, with full flanks and hams that extend well down toward the hocks. The back is slightly arched with ribs well sprung, good depth and even bottom lines. He stands on good feet well set apart and handles

himself with ease. His head is short and well dished, his ears erect, his eye wide-open and clear. The boars are very prepotent and the sows prolific, careful mothers and good sucklers, raising a large percentage of the number farrowed.

The American Berkshire Association, the first association for the registry and publication of pedigrees of swine, was organized at Springfield, Ill., March 25, 1875. Geo. M. Caldwell of Williamsville, Ill., was elected president. Hon. A. M. Garland, Secretary of the Board of Agriculture of Illinois, was elected Secretary, and Phil M. Springer, assistant secretary and treasurer. In 1877 Mr. Springer was elected secretary and treasurer, and in 1899 the Association was incorporated.

Berkshire breeders the country over are good-spirited, aggressive men with individuality. There is not another livestock organization where good fellowship and a spirit of boost

all sheep raisers in their section, have been compelled to supply some supplementary feeds in addition to corn silage, which they have used in past seasons.

To satisfy themselves as to the efficiency of various feeds, three lots of 150 head each were selected last winter. One lot was fed corn silage and all of the volunteer hay they would eat. Another was fed a ration of alfalfa meal and cane molasses, while a third was fed a ration of one-third alfalfa meal, one-third cane molasses and one-third Indian corn.

In checking up on the three lots after 30 days, Mr. Rutherford, superintendent of the ranch, found that those fed on silage lost 130 pounds, those on molasses and alfalfa meal gained 160 pounds and those on corn, molasses and alfalfa meal gained 890 pounds.

The weather during the 30 days was as bad as any experienced dur-

An Outstanding Berkshire, Forest Grove Laurel 2nd—A fine type.

is more apparent than the Berkshire Congress. This same spirit is the first essential toward the advancement of any common cause and this unique organization affords opportunity for acquaintance and co-operation.

At the Panama-Pacific Exposition in 1915, the Western Berkshire Congress was organized and since then this association has been quite active. At this time its officers are: F. R. Steel, president, and Arlington Smith, secretary. The first Western Congress sale was held in 1915, at which prices averaged \$150 per head. At the State Fair in 1916 the second sale was held, at which Berks sold for an average of \$100. In February, 1917, the third sale was held at the State University Farm and prices averaged \$130.

SHEEP FEEDS IN DRY SPELLS

[Written for Pacific Rural Press.]

Keep your sheep in good condition even if you have to supply expensive feed in dry seasons, is the policy of Bishop Bros. with their flock of purebred Shropshires.

During the past season, they, like

ing the winter, and for that reason Mr. Rutherford felt well satisfied with the gains made on the alfalfa, corn, and molasses ration.

He questions the advisability of trying to profitably fatten sheep on this ration, but states it is the best supplemental feed he has found for carrying sheep over dry spells.

We have a few late fall and winter pigs to offer. They are bred in the most popular lines of the breed.

We guarantee satisfaction or you get your money back.

Berkshire Jottings

These notes are taken from reports of Berkshire breeders sent us by request for this issue. We wrote to every breeder of whom we had knowledge. All did not respond and some reports are not entirely complete. However we believe that on the whole they give a good idea of the amount of breeding stock and the blood lines in the State.

Cedar Hurst Farms, Sacramento: Five sows Kennet and Chiefs Princess breeding.

Geo. J. Carr Ranch, Marysville. Just starting foundation mostly Grand Leader breeding. One sow three gilts and young boar.

Geo. Kounias. 6 sows of Grand Leader 2nd, Rookwood and California Royabet breeding. 14 young gilts. Boar Premier Longfellow.

G. A. Murphy, Perkins, Seven sows of Robins Ruby and Columbia Model breeding. Boar Kennet Lee Jr., grandson of Kennet. Young stock and spring pigs.

Chas. Goodman, Williams. Seven sows of Black Robinhood, Baron Duke and Masterpiece breeding. Young stock, 15 head. An old established and well known herd.

Lomas Altos Ranch, Monterey. Three sows of Fashion Longfellow, Mayhews Queen and May Starr breeding. Herd boar, May Starr by Superior Starr out of Highwood May Belle.

Dallas Bache, Hollister: Ten sows of Matchless Longfellow, Fashion Longfellow, Columbia Model and Longfellow Premier breeding. Herd Boar sired by Grand Leader 2nd out of Mayhews Queen.

Geo. M. York, Modesto. Seven sows of A. B. Humphrey, University Farm. Hood Farm and W. E. Spicer breeding. All to farrow spring pigs by Premier Leader and Loyal Duke.

A. L. Stephenson, Los Molinos. Three sows of Duke, Silbira and Laurel Champion breeding. Herd Boar, Tehama Chief by Panama Lee out of Mayhews Dora. Young stock 7 spring pigs.

Holbert Farm, H. Gist, Tulare. Six sows of Longfellow, Rival Baron Premier Ravenwood, Dutchess and Masterpiece breeding. Boar, Winona Dukes Champion by Laurel Champion out of Dukes Lady Value 10th.

Oak Grove Dairy Farm, Woodland: 20 sows of Masterpiece Improver, Longfellow, Charmer's Duke, Robin Hood, Baron Compton, Berryton, Premier and Belle Wilts breeding. Boars (1) Brinton Longfellow (2) Improver B (3) Ravenwood Longfellow's Rival.

Perkins Company, Perkins. Three sows, Highwood Columbia and Legal S. breeding. Herd boar, Majestic King 6th, first prize at State Fair 1916, by Ruby King 4th out of Majestic Bernice 9th. Young stock, 25 gilts and boars.

Pacific Sugar Corporation, Tracy: 24 sows of Rival's Champion Best, Baron Duke, Rookwood Lady, Lord Premier, Longfellow, Dutchess and Masterpiece breeding. Herd Boar Ames Rival 45th. Young stock (number not given).

Rancho De Napa, Frank B. Stetson: 3 sows, daughters of Artful Masterpiece and Iowana Majesty. Pure bred to Masterpiece and Lord Premier. Herd boar, Oaks Superba by Superbus out of Baron's Belle; 15 head young stock, 15 gilts and boars over 6 months and spring pigs.

Hedgemere Farms, H. J. Hammond, Sacramento. Two sows, of Fashion Longfellow, Star Value and Grand Leader 2nd breeding. Herd boars (1) Hedgemere Irving, by Grand Leader 2nd out of Golden Lady Value; (2) Hedgemere Benjamin, litter mate to No. 1. Young stock, two boars, one gilt.

University of California, Davis. Twelve sows of Ravenwood Longfellow, Rivals Champion Best, Superior Star and Grand Leader 2nd breeding. Young stock (number not given), sired by Star Leader, Re-

serve Grand Champion at P. P. I. E., recently sold to Anchorage Farm for \$1500.

Santa Anita Rancho, Santa Anita: Sows (number not given) Laurel Champion, Robinhood, Dutchess, Baron Duke, Premier, Fashion Longfellow and Grand Leader 2nd, breeding. Herd boar, Kintyre Laird, Reserve Senior Champion at Panama Pacific, by Kintyre Duke out of Monarchs Dutchess. Young stock (number not given).

Sierra Madre Ranch, Russ Avery and J. K. Miller, Lancaster: 36 sows Laurel Champion, Dutchess, Silburfa Belle, and Columbia Model breeding. Herd boars: (1) Ames Rival 106th bred by Rookwood Farm Iowa and Yatama Sunrise 20th, Grand prize winner at P. P. I. E. Young stock (number not given). High class young boars and gilts of promise.

Brighton Farm, H. L. and E. H. Murphy, 30 sows of blood lines of best Berkshire families among them. Ideal Lady Panama Dutchess, Rival's Pointer Star 15th, Majestic Girl 10th, etc. Boars: (1) Rival's Robin 2nd Grand Champion at Sacramento 1916, (2) Lustre Robinhood (3) Mayfield Champion (4) Artful King 11th. Young stock, number not given. Spring pigs. This is one of the pioneer Berkshire herds and has an enviable show record.

W. H. Waugh, Riverside: Sixteen sows of Star Value Masterpiece, Rival's Champion's Best and Baron Duke breeding. Herd boars (1) Wilts Masterpiece by Artful Masterpiece out of Belle Wilts. (State Fair blue ribbon winner). (2) Values Bachelor by the \$4000 Star Value out of Lady Bachelor 5th. (3) Pacific Star Masterpiece. (4) Fontana's Rival Masterpiece (combines Rival Champion's Best and Masterpiece breeding).

Shady Glenn Stock Farm, Dean Beeman, Woodland: Sows (number not given) of Ravenwood Longfellow, Artful Masterpiece, Lord Premier and Rivals Champion's Best breeding. Herd sire, Baron Longfellow 2nd Combination, a grandson of Baron Longfellow 2nd, reserve grand champion at St. Louis World Fair in Longfellow breeding. Young stock sired by Baron Longfellow 2nd Combination.

James Mills Orchard Company, Hamilton. Fifty sows of Laurel Champion, Silbira, Lustra and Improver and Rival's Champion Best breeding, including Forest Grove Laceral 8th, reserve grand champion sow at 1916 California State Fair. Boars, (1) Ames Rival 70th; (2) Bandmaster 2nd; (3) A son of Grand Leader 2nd; (4) Mill's Improver 2nd. Young stock, 75 head gilts and boars.

Hopland Stock Farm, A. W. Foster Co., Hopland: 24 sows. Masterpiece and Longfellow breeding also Lady Mayhews, a daughter of Grand Leader 2nd, and Grand Champion sow at Western Berkshire Congress Show, Sacramento 1916. Boars (1) Royal Painter 2nd, (2), Iowana Rival Majestic (Reserve Grand son of Rival's Champion. Young Champion at Sacramento 1916). A stock, 100 head gilts and boars.

Rose Crest Berkshires, F. L. Hall, Perris: 14 sows of Grand Leader 2nd, Laurel Champion, Rival's Champion best Masterpiece, and Robinhood breeding, including a litter sister to Junior Champon boar, Sacramento 1916 and five grand daughters of Rival's Champion Best. Herd Boar Ames Rival 118th by Rival's Champion Best out of Successor Duchess 8th. Young stock (number not given) spring pigs of fine type by Ames Rival 118th.

Anchorage Farm, Mark Requa, Orland. Twenty-four bred sows of Rival's Champion, Rival's Champion Best, Lord Premier, Panama Lee and Superbus breeding. Herd boar, (1) Star Leader, son of Grand Leader 2nd and reserve grand champion to his sire, at World's Fair Swine Show P. P. I. E., purchased from University Farm for \$1500; (2) A young boar sired by Mayhews

Grape Wild Farm BERKSHIRES

Grand Leader 2nd—World's Fair Grand Champion.

At the P. P. I. E. on 18 entries we won 24 ribbons, including 7 Firsts, 4 Championships and Premier Breeder.

At the 1916 State Fair: The Get of Grand Leader won Grand Champion Sow, and she sold in the Congress Sale for \$500—the highest price ever paid for a California bred Berkshire Sow. Also won first on Get of Sire; First on Aged Sow; First, Senior Yearling; First, Junior Yearling, and second Under Year Sow.

A Sow Bred to Grand Leader topped the list at the Berkshire Congress Sale and one of his sons recently sold at private sale by the University of California for \$1500.

Present Sale Offerings—Ten Service Boars 8 to 14 months of age at Farmers' Prices. We have the best and we want them in the hands of real Farmers.

February and March Pigs Are Coming on Fast and we can furnish Boars and Sows, or Trios, unrelated.

We can furnish a few Bred Sows, but we will hold the most of our young females to be bred for August Sale of Bred Sows. Watch for announcements later.

Registered Berkshires

We are now offering weanling Boars and Gilts sired by our GREAT HERD BOAR, IOWANA RIVAL MAJESTIC, RESERVE GRAND CHAMPION, SACRAMENTO, 1916, and a SON OF RIVALS CHAMPION 112590.

PLACE ORDERS NOW

San Francisco Office: 1210 Flood Bldg.

MY BERKSHIRES

Are registered and cholera immune. Rival's Champion's Best and Masterpiece breeding. They show high quality and size, yet are so priced that the progressive pork producer, as well as the breeder, cannot afford to overlook them. They are the easy feeding, quick maturing kind from prolific litters (average 8.5 pigs at weaning), out of choice dams and sired by big, classy, 1st-prize winning boars. 3 months pigs from \$15 up.

Choice growthy fall Boars and Gilts \$25 to \$40. Watch Classified Column for special offerings.

W. H. WAUGH Riverside, Cal.

Rancho de Napa Berkshires

Herd headed by OAK'S SUPERB 191212, sired by world's greatest boar, SUPERBUS 136000, and out of BARON BELLE'S 11th, 176946. Two yearling boars for sale sired by above and from an Artful Masterpiece and an Lowana Majesty sow.

FRANK B. STETSON, Napa, California.

The Duroc-Jersey Hog---Great Pork Producer

Written for Pacific Rural Press by Elmer Lamb, Ceres, Secretary of the Duroc Breeders' Ass'n.

The early history of the Duroc reveals to us pretty clearly that he is all that was best in two or three strains of red swine; the massive coarse Jersey Red of New Jersey, the more compact Duroc of New York and the Red hog of Kentucky, whose ancestry doubtless came over from North Africa in slave trading vessels. Naturally it was some years before there was an established type, much less was there strong family lines. These were built by the slow process of elimination and development.

The Jersey Red was a hog of extreme size, as can be gleaned from Clark Petit's history of that breed. He gives the results of butchering contests, in which the prizes went to the farmer producing the biggest carcass. The following are some of the weights: 30 head 22 mos. old averaged 686 pounds dressed; 50 head 17 mos. old averaged 520 pounds; 5 aged barrows averaged 1053 pounds; the largest barrow reaches the enormous size of 1302 pounds.

Record Association.—The first record association was organized by some Wisconsin breeders in 1882. In 1888 the American Duroc-Jersey Swine Breeders' Association was organized. In 1891 the National

ers are not retarding the breed by inconsistently sticking to any one individual that demonstrates his ability of breeding. Any outstanding individual to sire the right kind, has a strong hold on the breeder regardless of blood lines. We do not wish to belittle blood lines—we would emphasize them, but not at the expense of the individual.

Leading Families.—Robt. J. Evans in his booklet, "The Old Red Sow," classifies the breed into eight best known families: Protections, Colonels, Top Notchers, Crimson Wonders, Golden Rules, Proud Advances, Orions and Golden Models. These are not named in order of importance but rather the order of development. These naturally trace some of their foundation from the same sire and dams.

The Protection family originated in the East. Among the best known of these are Ohio Chief, Chief of Ohio, Red Chief Iam, Ohio Chief II, Cherry Chief, Cherry King, The Professor. Ohio Chief was a consistent winner in the hands of S. E. Morton, who sold him to Harding & Osborne of Iowa for \$2000, who in turn sold third interest in him to Morrison of Nebraska for \$2000. The Cherry Chief, Cherry King and The Professor lines have been the

champion at the St. Louis World's Fair 1914. He got Orion Chief who sold for \$3,500.

The Crimson Wonder family was produced in the West coincident with the Top Notchers and Golden Rules in the East. The Crimson Wonders have produced more noted animals in the West than any other line.

The Golden Rules were developed in Ohio. The most noted of their boars being Choice Rule, Good Enuff, Burke's Good E Nuff, a noted sire of the West.

The latest developed family is the Golden Models, developed in Iowa. They have been the most consistent prize winners of the Middle West for the last five years. Their popularity is attested by the fact that a few days ago the Waltermeyers sold 60 bred sows and gilts at auction that averaged \$207 per head.

New to California.—The breed has recently attracted interest in California. Although there were good Duroc-Jerseys brought to and bred in California considerably earlier, the pioneer exhibitors of recent years at Sacramento were Fraser of Denair, Daggs of Modesto, Slocum of Willows and Eakle of Woodland. In 1912 there were only a few hogs exhibited. In 1914 they lacked only a few of outnumbering any other breed. Californians have not been slow in appreciating the many good qualities of the Duroc and they have gone after the best in Eastern herds. Every one of the noted families above is represented by many excellent sons and daughters in this State.

Why They are Popular.—The Duroc has stood the test of every condition imposed upon him, and is equally at home on the foothill range, the stubble field, alfalfa pasture or dairy ranch. He can stand the cold of the mountains or torrid heat of the valley with any breed. They are exceptionally quiet and docile. You very seldom see a vicious sow, even at farrowing time, and hardly ever a vicious boar. They are good sucklers, good mothers, hardy, resisting disease, and always on the job making pork, ready for the block at any time.

Purebred Durocs Feeding.

Duroc-Jersey Record Association was organized, since which time there have been two associations, which have recorded to date more than five hundred thousand Duroc-Jersey hogs.

Ideal Pork Hog.—The Duroc has been developed through half a century of careful consideration of the qualifications necessary for the best machine to convert grain and grass into pork. How rapidly he has come into his own and convinced the pork growers that he is nearer the ideal pork hog than any yet produced, one only needs to look over the records of shows, sales, registry books, and note the per cent of Durocs that come to the market centers of the nation.

Prolificacy.—This is not to be wondered at when the prolificacy of the Duroc sow is considered. About March 1st this year, Geo. Wood, Ceres, had a Duroc sow farrow 25 live pigs; while near Denair, another party had a grade Duroc farrow 23. While these litters are unusual, eight pigs raised per litter is a fair average for the Duroc.

Constructive Breeding.—The true American values a man according to his ability to do things. Just so with the Durocs. The constructive breed-

most popular lines from Ohio Chief in the last five years.

The most noted line of sows of the Protection family was the Duchess line, of which Duchess 40th is the most noted. She was mated to Protection and produced Ohio Chief and Chief Ohio; she was mated to Orion II and produced Top Notcher.

Colonel M was a 1st prize winner at the Columbian Exposition 1893. The most noted boar of the Col. family was King of Cols. He was a failure in the show ring, never winning higher than 3rd. He was sold by Carl Scott to Mr. Morton, who refused \$10,000 for him afterward. His progeny are the most widely used today of any. His son, Defender, sold twice for \$5000.

Proud Advance is noted as a great producer of sows. His failure to produce any noted boars caused his line as a family to soon run out. His daughters hold the record in number sold at high prices. One, Proud Zeda, sold for \$2,600.

Orion family was founded in Iowa. He was mated to Ohio Anna and got Orion II, who went to Ohio. Orion II mated to Duchess 40th, produced Top Notcher, head of that family and sire of Tip Top Notcher, grand

Duroc-Jersey Items

These notes are taken from reports of Duroc-Jersey breeders sent us by request for this issue. We wrote to every breeder of whom we had knowledge. All did not respond and some reports are not entirely complete. However we believe that on the whole they give a good idea of the amount of breeding stock and the blood lines in the State.

R. E. Dixon, Hanford: 10 sows, 2 boars of Defender and Foxy Model breeding. 50 head of young stock.

Leonard Farm: W. J. Hackett, Ceres, 3 sows of Good Enuff and Ohio Chief breeding. Fall and Spring pigs.

Wm. Way & Sons, Modesto, 7 sows, Good Enough and Crimson Wonder breeding. Herd boar, Standiford Chief.

W. L. Reedy, Tulare: 2 sows, Defender and Bill Boy breeding. Boar, Budd by Bill Boy. Young stock, 14 head.

L. J. Gamble, Winton: 8 sows of Sensation, Golden Model and Crimson Wonder breeding. 3 herd boars same strains.

F. M. Barney, Hanford: 4 sows, Elmer Lamb's breeding. Herd Boar, Mandy 13, by Taxpayer. Young stock, 20 head.

C. R. Sorter, Tulare: 3 sows (Defender and Nebraska Belle breeding). Herd Boar, Colonel Wonder 3rd. Spring pigs.

Ora P. Burns—100 sows eligible to registry, blood lines not given. Herd Boar Joaquin Prince. Sire Imperator, Dam Tilley.

Henderson Company, Sacramento, 8 sows breeding not given. Herd Boar, Fruits Orion (Jr. Champion Oregon State Fair 1916).

J. L. Dickenson, Visalia: 9 sows of Colonel and Sensation breeding. Herd boars, Big Dick, Beauty Boy, sired by Burk's Goodenough.

Geo. A. Farmer, Hanford: 5 sows, Colonel and Sensational Model breeding. Herd Boar, Farmers Improver. Young stock, 15 spring pigs.

New England Corporation have 50 registered sows, 12 registered boars. Breeding not given. Five young boars, 40 gilts eligible to registry.

E. C. Hoover, Turlock: 4 sows of Colonel Chief and Modesto King breeding. Herd Boar bred by University Farm, sired by Colonel out of Advancer 3rd.

H. E. Boudier & Son, Napa: 4 sows, Crimson Wonder and Colonel breeding. Herd Boar H. F. Colonel (2nd prize State Fair 1916). Young stock, 15 gilts.

Dos Hermanos Rancho at Ukiah: 6 sows of Sugar Valley and Model Colonel breeding. Herd boar Advancers Chief 3rd. A goodly number of fine Spring pigs.

Derryfield Ranch, Dr. Geo. A. Spencer, Sacramento, 8 sows of Gold Model, Crimson Wonder and Orion breeding. Herd boar, Derryfield Colonel. Young stock, spring pigs.

University of California, Davis: 12 sows of Crimson Wonder, Advancer, and Colonel blood lines. Herd Boars (1) Model Colonel. (2) University Wonder (a Crimson Wonder boar).

J. M. De Vilbiss, Patterson, number of sows and breeding not given. Sows related to Grand Champions. Herd Boar Crimson Monarch 2nd (champion 18 months class 1916 State Fair).

R. C. Sturgeon, Tulare: 7 sows, Defender, Colonel Sensation, Primrose, Golden Rod Critic B and Golden Choice breeding. Herd Boar Orion's Golden Colonel 2nd, son of Pathfinder. 16 Spring pigs.

Allen Thompson, Tulare: 9 sows of Defender, Gold Model, Long Wonder, Critic B and Illustrator breeding. Herd Boar, Orion Golden Colonel, a consistent winner at County Fairs. Young Stock, 100 Fall and Spring pigs.

W. P. Harkey, Gridley: 5 sows, University Farm, Frazier and Rucker and Coppin breeding. Boar, Ahtatum Perfection, by J. K.'s Colonel, out of

Glady's 11th. Young stock; 24 boars and gilts by California Defender and Model Colonel.

John P. Walker, Visalia: 15 sows of selected breeding. Defender King's Colonel, etc. Herd boar, Tulare Boy grandson of Defender, out of Bell Boy. Has some fine young stock out of his former senior herd boar, Ely's Colonel.

Perkins & Co., Perkins: 4 sows of Nebraska Sensation and Modesto King breeding. Herd Boar Fredonia Prince, 3rd prize California State State Fair 1916 by Swineland 1st, out of Queen of Swineland. Young stock, 25 boars and gilts.

C. T. Thompson—12 sows of Crimson Wonder, Lady Surprise Monarch of the Nook, Colonel and Sunkist breeding. Herd boars: Colonel 2nd, sired by Royal Muriel out of Sheldon's Belle and Thompson Pilot Defender, Sire Silver Defender, out of Forest Beauty.

Elmer Lamb, Ceres, 11 sows of Cherry King, Orion Golden Rule and Helen Blazes breeding. Including Jr. Champion sow and reserve Grand Champion sow at Panama Pacific. Herd Boar, Orion Model, sired by Orion Cherry, King Grand Champion, Omaha 1916. Young stock, 2 boars, 20 gilts.

Tagus Ranch, Tulare: Sold down to 30 best brood sows of Cherry King. Fashion, Improver, and Center of Attraction breeding. Herd Boar, California Defender (Junior Champion at P. P. I. E.) Sired by Crimson Wonder, out of Gladys 2nd. Young stock, spring pigs by California Defender.

H. P. Eakle, Woodland, 50 sows of Tip Top Notch and Crimson Wonder breeding. Herd boars: (1) Colonel Keep On, 2nd prize 1916 State Fair; (2) Oregon Defender by the only boar two times Grand Champion Chicago International, (3) H. P. Wonder, out of Grand Champion Sow of Nebraska 1914.

Frederick M. Johnson, Napa, 8 sows of Orion, Cherry King, Good Enuff and Ohio Chief breeding. Just importing Pathfinder sow from the East. Herd boar, bondholder, a son of P. P. I. E. Grand Champion and just in the under year class at Sacramento 1916. Young stock. 60

The Ormondale Company, Redwood City: Five registered sows, among them, Red Beauty 2nd, out of Red Beauty and tracing back on sire's side to U. R. Colonel. Herd boar, Commodore Colonade, sired by Locust Hill Colonade, out of Lady Commodore. Young stock (number not given); a fine litter out of Red Beauty 2nd, sired by Willettas Wonder.

Haden Smith, Woodland, herd consists of line bred Colonel, Golden Model and Crimson Wonder. Sows (number not given) selected for show quality as well as for prolificacy and quick maturing. Won first herd and first prize at Swine Show at Sacramento 1916. Herd sire, Uneeda Wonder, by Uneeda Crimson Wonder, by Crimson Wonder, out of H. A.'s Queen. Young stock (number not given). Fall pigs and Spring by Uneeda Wonder.

Swineland Farms, W. O. Pearson, Woodland, Durocs: 10 sows of Mo. Girl, Colonel Brown, Kruger Chief, Sunset Queen, Ruby, Buddy and Perfection breeding. Boar, Rosebud Boy 2nd, by W. L. A.'s Perfection, out of Yuba Girl. Young stock, 40 head Fall and Spring pigs. Tamworths 19 sows of Glenola Lady Bryan, Profit Farm, Longfellow, Excelsior, Nesbit, Choice and Queen breeding. Boar 1. California 2nd, by Mr. Home Indiana, out of Salvation Nell. (3) Nunrod 4th, by Nunrod 3rd, out of California Queen. Young stock. 40 Fall pigs and 50 Spring pigs.

Uneeda Glenn Co. Herd, H. O. Slocum & Sons, Willows: 10 sows of Colonel, Golden Model, Perfection Wonder, Crimson Wonder. Grand Model Illustrator, Kruger Chief, Defender and other leading Duroc blood lines. Herd boar Uneeda Wonder. 2nd prize Neb. State Fair 1916, by Uneeda Crimson Wonder, by Crimson

Wonder, out of H. A.'s Queen. Young stock, 30 gilts and boars; also spring pigs by Uneeda Wonder.

Ginn & Son, Corcoran: 2 sows, Colonel breeding. Herd Boar, Imperator. Young pigs, 20.

All stock guaranteed as represented. Thirteen years a Duroc breeder and no regrets.

Correspondence solicited. Visitors welcome.

H. P. EAKLE, JR.

Tamworths.

As they are now bred, the Tamworths are a very large bacon type of hog—grow rapidly and produce good meat. They are good rustlers and consequently can be raised on pasture to advantage. They originated in England, but of their early history little is known, other than they were very large, coarse, active animals.

The secretary of the American Tamworth Swine Association, E. N. Ball, Hamburg, Mich., reports that there are nearly 300 of this breed in California.

Tamworths should have golden red hair on a flesh-colored skin, long snout, large ears, chest wide and deep, shoulders slanting and well set, legs set well outside body, back long and straight, loin strong and broad, sides long and deep, ribs well sprung, flank full and let down, hams broad and full.

Breeders claim for them great hardiness, pasture and stubble feeders, producing lean meat, very prolific and great size.

Swineland Duroc - Jerseys and Tamworths

* TAMWORTH, the bacon hog. We have the largest herd in the State. Twenty sows of best blood lines, headed by California 62nd and Nimrod 4th. Duroc herd headed by Rosebuds Boy by W. L. A.'s Perfection out of Yuba Girl.

Mature stock and weanlings of both sexes. Sure to please.

J. M. DeVILBISS

Patterson, Cal.

The Chester White Breed in California

[By C. B. Cunningham Mills, President Calif. Swine Breeders' Association.]

About the year 1812, there were found in Delaware and Chester Counties, Pennsylvania, large white hogs that were supposed to have been brought there by the Quakers. These animals, while having extreme size, were very coarse and slow in maturing. In 1818, the Cumberland, a large white hog from Bedfordshire, England, was introduced for crossing these native animals and within a very few years the Improved English China, another white hog of very early maturing qualities was imported; later the Thin Rind, now called the Hampshire, was introduced in the cross, so that the Chester White blood comprises all of these. In 1848 it was decided to call these white hogs, Chester County Whites. Later the name was shortened to

spective of the type or color of the sows. They will stand all climatic tests with any breed; the introduction of Chester blood in any herd is immediately apparent in the disposition of the pigs.

The Chesters are probably the only breed that has never been bodsted and today one can secure the highest type animals at a very reasonable figure.

As regards the different blood lines, no one family stands out as prominently as it does in other breeds; the blood lines at present most popular and the individuals that are bringing the highest prices are from the Wonder, Combination and St. Elmo strains, or a combination of them.

Wonder has probably produced

O. I. C.

Geo. M. Frazer, Glen Frazer: Two gilts and one young boar.

Cedarhurst Ranches, Sacramento: Four gilts and 3 boars, of Iowa Boy, Tessie and Gussie breeding.

B. F. Nickell, Orland: 4 sows. Boar: Sidney, breeding not given. Young stock, 19 spring pigs.

The Melone Co., Napa: Fifteen sows. Herd boar, Lucky Dog, breeding not given. Young stock (number not given).

A. H. Gilbert, Pixley: Three sows (Hiawatha, Blue Bird, and Cream Cap Perfection breeding). Boar: Mills' Chief by Chief Again out of Nancy.

University of California: Four sows including 1st and 2nd prize pigs at 1913 International Bredels breeding. Herd boar, a son of William A., grand champion at National Swine Show 1916.

S. R. Cheney, Strathmore: Four sows of Cream Cup and California Boy, and Chief Again breeding. Boar: Perfection Boy sired by Iowa Boy out of Mill's. Best Young

stock, 22 gilts and boars.

Highland Herd, R. L. Robinson, Fair Oaks: Four sows of Brendel's Beauty, Jim's Dandy, Pallenmades White Eagles and Naval breeding. Herd boar, Benito Boy by Palten-made out of Brendel's Beauty. Young stock (number not given), promising gilts of Chief Triumph and Perfection Boy blood lines.

Billiken Herd, C. B. Cunningham, Mills. Sows (number not given) of Combination 2nd, Wonder, St. Elmo, Wildwood, Price Juanita and Perfection breeding, including grand champion sow at Sacramento 1916. Herd boar, Billiken by Wm. A. out of Elmo's Pride. Wm. A. was 1916 grand champion at Iowa and Michigan State Fairs and at the National Swine Show at Omaha. Young stock a few bred and open gilts and some nice fall pigs.

Forty-nine Pig Club members of Imperial Valley wound up their contest last Saturday with a show in Brawley where Prof. G. H. True of University Farm judged the stock and addressed visiting farmers.

O. I. C. and BERKSHIRE PUREBREDS

We have a few choice 8 months' Berkshire gilts yet on sale, and one 8 months' O. I. C. gilt; also one of two and a half months. Would sell a tested O. I. C. boar, 18 months old—a magnificent specimen of this superior breed; and one 8 months old—all in splendid breeding condition, and VERY moderate in price, considering the present price of hogs.

CEDARHURST RANCHES, R. F. D. No. 2, SACRAMENTO.

By courtesy Calif. Hog Book.
Chester White Sow and Boar.

Chester Whites; today they are often known and advertised as Improved Chesters, O. I. C.'s, etc. All, however, trace back to the same ancestry and are none other than a family strain or name type.

The great size, easy feeding qualities, even disposition and ability to not only produce but to raise large litters of uniform pigs that matured at an early age gave them such a reputation and created such a demand, that unscrupulous dealers, at the close of the Civil War, sent out any kind of a white pig as a Chester, and this caused such a set back to the breed that it is only in recent years that they have come to the front again.

It is impossible to state just when the first Chesters were introduced into California. There has been white hogs in this state for a long time, but most of them were of a very coarse type, thin haired and not very satisfactory. The Chester White of today is the equal of any breed in the State. They are easy feeders, mature early and fatten quickly at any age or size. The sows are very prolific and raise large litters of uniform pigs. The boars are exceptionally strong in reproduction and stamp their individuality on their pigs, irre-

more Champions and Grand Champions than any other boar.

Combination 2nd, sired by Combination, has more high-priced public sales individuals to his credit than has any other sire.

St. Elmo, an extreme Eastern boar, has not only a wonderful record, but has produced numerous sons and daughters that he has stamped with his good qualities.

Any good individuals of these three blood lines are valued very highly.

There are the famous Lenora and Juanita and many more family strains that are equally as good, although not as well known.

Why the Chesters should be popular in California? The sows farrow large litters of uniform pigs and have sufficient milk to suckle and raise them. They are gentle and contented and make rapid gains; quickly adapt themselves to local surroundings and do well either on the range or in the fattening pen. They dress nice, clean, white, and high percentage carcass. They can be fattened at any age or size. Moreover one can secure good type serviceable animals at a very reasonable price. They really possess merit and should rightly be termed the Real Mortgage Lifters.

Hampshire Swine.

[Written for Pacific Rural Press by J. W. Henderson, Berkeley.]

That California will grow barley, corn, feterita, Milo maize and alfalfa, and that in abundance, is conclusive evidence that pork can be produced as satisfactorily as in the East.

There have been two serious drawbacks in the past which seem at present in a process of solution: First, the mongrel hog formerly bred here, and second the low prices relatively received for the same.

Of recent years the quality of hog has changed because of the introduction of the purebred, which has already demonstrated its ability to more than pay its way in its greater economy of transformation of food-stuffs into pork which is of a superior quality as well.

All breeds have their admirers and are aiding in the above transformation. Probably the most recent breed to enter the field is the Hampshire, representatives of which are appearing on the ranches of a goodly number of progressive hog men.

The History of Hampshire Swine is not definitely determined and their origin is a thing of obscurity. There are, however, a few facts which may prove of interest to breeders of

time there were less than 25 breeders of Hampshires in the world and on January 1, 1915, there were 10,380, with a registration of about 60,000 sows and about half that number of boars in the U. S. alone, while in Canada there were about 100 herds and a few had found their way to South America.

A demand for the hog soon came from the Pacific Coast and herds appeared in Washington, Oregon and California. There may have been Hampshires introduced here before 1907, but it was in that year that the Four Oaks Stock Farm, of Woodlands, took out membership in the Association. The second membership was taken out by the writer, after having brought into the state two bred gilts and a young boar. Schmidts Bros. of Salinas, Cal., early began the breeding of Hampshires in the state and were first to convince the writer of the rare ability of the Hampshire as a rustler.

There has not as yet been formed a State Hampshire Association, but as there are already a considerable number of breeders here it is likely one will be organized before long.

Good types of Hampshire breed.

Hampshires and their admirers.

Contained in the archives of the Department of Animal Industry at Washington, is an interesting volume entitled "The Breeds of Domestic Animals of the British Isles," written in 1842 by David Lowe, a Professor of Agriculture in the University of Edinburgh, where in writing of the different breeds of hogs he shows an illustration of a belted hog and states that it is known as the old English breed. He speaks of them as being in the Hampshire district of England, and refers to them as Hampshires; e. g., "The Hampshires were also a very noted breed, from their beginning, for large size and well suited for choice bacon."

Before many years there came a demand from the great corn belt region for the Hampshire. Owners and breeders began to enthrall and John Goodwin of Illinois concluded his looked good enough to get into a class, and in 1901, his Hampshires made the first appearance in a great show—The International at Chicago.

At this show there was present no less a personage than the U. S. Secretary of Agriculture Wilson, who expressed it as his opinion that the Hampshire had come to stay and later the Hampshire Record was admitted and Hampshire became a recognized breed. As a result of this the breed received a partial recognition at the Louisiana Purchase Exposition at St. Louis 1904. At this

TULARE, CALIFORNIA

Rio Monte Hampshires

BRED SOWS, BOARS, BRED AND OPEN GILTS, PIGS AND SHOATS. After two years of careful breeding and selection, we are now offering a very fine lot for foundation stock. All inquiries will receive careful and prompt attention. Special prices to boys' and girls' pig club contestants.

BROBECK & LATHROP, Route D, Box 138, Modesto, Cal.

HAMPSHIRE NOTES.

R. O. Bagley, Tulare: Two sows (imported). Boar, Nebraska Duke by Cordova King out of Cordova Lady. Twenty-six fall and spring pigs.

H. E. Richardson, Chico: Eleven sows of America, Fire King, May Belle, and Palo Verde breeding. Boars: (1) Palo Verde Bruno, by El Salvador out of Palo Rose; (2) Savannah by Berkeley King and Miss Showers. Young stock, 4 gilts and spring pigs.

Bella Vista Herd, Dr. J. W. Henderson, Berkeley: Seven sows including daughters of General Wickware, who was sensation at Omaha last year, and descendants of Pat Malloy at 1916 State Fair. Bella Vista herd won grand champion and junior champion sows. Boars: (1) Berkeley King by Glen Allen out of Carmel Queen; (2) Kenwood II by Silver Jr. out of Joseph Merry Widow; (3) Queen's Model Fair Promise by America (descendant of Pat Malloy) out of California Queen. Young stock, 90 head.

Llano Vista Herd, F. A. Langdon, Perris: One hundred and fifty sows of Mose Messenger, Cherokee Plummer, Gen. Tipton, King Pat, Quality, and other good Hampshire blood lines. Among them Sioux Queen, grand champion of the world at San Francisco 1915 and other P. P. I. E. prize winners, as follows: Lady Favorite, Velvet Lady Selvina and Western Favorite. Herd boars: (1) Gold Mine, grand champion of California; (2) The Harvester, junior champion Panama-Pacific; (3) Langdon's Choice; (4) Prince, sired by Gen. Tipton Again, the grand champion of the world and out of Sioux Queen, grand champion sow.

Prize Winners

HAMPSHIRE

The above illustration shows one of our best brood sows with litter of pigs. We have many others just as good.

We have reasons for choosing the HAMPSHIRE breed above all other breeds. We have experimented and know what they can do. The farmer who wants a hog that puts on 200 pounds of firm meat at six and a half months of age—economically, that thrives under adverse conditions, that resists disease, is prolific, and a hog the packer likes, buys the HAMPSHIRE. If you visit our ranch we will show you.

Herd won highest honors at P. P. I. E. 1915, and California State Fair 1916.

HAMPSHIRE

TAHOE,
Grand Champion Sire, Cal. State Fair,
1916.

The Bella Vista Herd of Hampshires represents the bluest blood in the breed.

A son of Gen. Allen—the undefeated 13 times Grand Champion Hampshire.

Daughters of Gen. Wickware—whose progeny was the sensation of the breed at the recently held Omaha Hog Show.

Descendants of Pat Malloy, services for whom was \$50.

Evans Bond, who headed the herd is son of the undefeated Messenger Boy.

Sire 15 times Champ. over Hampshires and 5 times Grand Champ. over all breeds.

Dam Nora Duchess, which twice topped the highest price paid for Hampshires at auction.

This herd secured 23 prizes out of 22 entries at the recent State Fair, including Grand and Junior Champ. sows and First on young herd bred by Exhibitor.

Write me about what you want and I shall furnish you a good Head Herder or unrelated male and female, and at reasonable figures.

GUERNSEYS

Bull calves, 4 to 7 months old, from PRODUCING dams,
\$125 to \$200 each.

Write for breeding if interested.

Improved Large Yorkshires

[Written by C. L. Tubbs, Calistoga.]

The hog raiser, in choosing his breed, should look carefully into the conditions under which he is to grow his hogs, his available crops, his pasture, the climate and marketing conditions, whether he sells by live weight, dressed carcass, or finished product.

A careful analysis of the characteristics of the Large Yorkshire shows that this breed will qualify for almost any condition. The dairy farm so popular in California today, is ideal for Yorkshires. Alfalfa skim milk and pasture, together with a little grain, will turn them off in remarkably short time. In the moun-

they transmit these qualities to the progeny, and the quickness and certainty with which the Yorkshire crosses bring renovation to swine deficient in breeding qualities, have been an outstanding feature of their popularity.

In conformation, the ideal Yorkshire has a long, deep body, back slightly arched; the back must not be open between the shoulders, must carry even width from end to end, with a good spring of rib. With a well-arched back the underline is generally straight and not cut up behind the front legs, or in the flank, allowing plenty of heart girth and capacity. There should be width enough to produce a good pork loin, but no more. The hind quarters must be long, to correspond to the shoulder

By courtesy Calif. Hog Book.
Yorkshire Sow and Boar.

tains, their active and rustling natures and their hardiness enable them to stand the cold and snow. In the interior they have no difficulty in withstanding the long, hot summers.

Yorkshires can be marketed in six to seven months, the most profitable age, and on account of the excellent quality of the meat, and the long, deep sides of bacon, breeders have enjoyed a large premium for many years. When 84 per cent of the dressed carcass goes for fancy ham and bacon, and only 16 per cent for lard, sausage and waste, one can readily see the reason for this.

As a breeder, the Yorkshire is pre-eminent. It is admittedly a very prolific breed—the litters running from 9 to 16. The sows are of gentle disposition, never become clumsy, even at an advanced age, and give sufficient milk to raise, in good shape all the pigs they farrow.

The Yorkshire asserts its individual characteristics when crossed even with objectionable types, giving to the progeny its own peculiar features—namely, a lengthy, deep side, and an abundance of fine-grained lean meat. The marked degree in which

and side, deep, with a moderate and gradual drop to the tail. The ham should be large, well let down on thigh and twist. The legs must be medium in length, strong, not coarse, and standing straight and firm. The hair is abundant, long, of medium fineness, without any bristles, and the color white on all parts, though dark spots on the skin do not disqualify.

Many writers claim that the Yorkshire is the oldest breed of hogs now in existence. In Yorkshire, England, a race of large coarse-boned, leggy, white hogs were common for a great many years. The main improvement in the breed has taken place within the past 60 or 70 years, and it is said that the first important step was the crossing of the Yorkshire with the white Leicester, which was a large breed, but finer in bone and more easily fattened than the old Yorkshire. Further improvement was effected by crossing with the Small White breed of England. Careful selection, in the hands of skillful breeders, has done much to improve the breed within recent years.

At the present time there is no breed of hogs so widely distributed throughout the world as the York-

MONTELENA HERD or Large Yorkshires

A Fine Group of Yearlings.

THE IDEAL HOG FOR THE PROGRESSIVE FARMER.

Larger litters; larger percentage of pigs raised; easier feeders; easier keepers; quicker maturing; higher price for finished product.

Montelena Herd won 9 prizes with 8 entries at Sacramento, 1916, including Reserve Grand Champion Boar.

A few service boars, also fall pigs of both sexes.

Hogs With Dairy Bring Bigger Profits.

Get all the 30-cent butterfat out of your alfalfa and corn silage; then get all the 14-cent pork out of the rest of their nutrients which will be in the shape of skim and buttermilk; then get all the plant food out of what remains. Then you can call yourself a scientific farmer. For in doing that, you will have raised the crops which produce the greatest tonnage of feed per acre and will have avoided the cost of long hauls. If you have a long warm season, you can raise grain for concentrates also, between the silage crops. Then you will have raised the greatest tonnage of suitable digestible nutrients per acre and will have fed them most economically to produce the highest-priced, most readily marketable products, with the least labor per dollar's worth of product.

No—not quite. That will not be true unless the animals are specialists in their work, and healthy.

The two feeds which produce greatest tonnage per acre in California are supplementary in a cow's ration—alfalfa and Indian corn for silage. These feeds are too bulky for a hog ration until they are turned into milk. If fed directly to hogs, much 30-cent butterfat in the form of alfalfa and silage is made into 12-cent hog meat; but a large part of the butterfat, especially in silage, is wasted entirely, for the hogs don't eat it clean.

So, cows are necessary in order to get the most dollars out of the feeds which can be most abundantly raised. But dairying would not always be

profitable without turning the skim-milk and buttermilk into high-priced products conveniently and economically.

How Much Milk.—Butter made last year in California creameries totaled 70,030,134 pounds, according to the State Dairy Bureau. If this averages 85 per cent fat, and if the average milk is 4 per cent fat, 1,428,615,549 pounds of skim and bona fide buttermilk were produced in California.

In no other way could this tremendous amount of the most easily digestible and palatable feed be used with profit except for hogs. And this profit is sometimes all there is in dairying.

How to Feed It.—Henry's experiments in Wisconsin showed the most value was obtained from skim milk fed to pigs with corn meal in the ratio of 3 to 1 by weight. One hundred pounds of grain was replaced by 327 pounds of milk when fed this proportion. Small pigs use a higher proportion of milk than older ones economically. In general skim or buttermilk is worth one-sixth its weight of grain.

Two Dangers to Avoid.—Milk without a concentrate to supplement and balance it does not make much profit above the cost of feeding it to pigs; and well over half its value is lost if fed alone or with alfalfa pasture only. The pork it produces thus is soft and inferior. The other danger is disease.

Dairy Hogs Diseased.—In four cities of a leading dairy State where

VISALIA

CALIFORNIA

hogs are fed skim milk, of all hogs slaughtered under Federal supervision in 1915, 9 per cent, 10.9 per cent, 12.1 per cent, and 25.1 per cent respectively were tubercular, though most of them showed no outward signs of it. Of the 451,478 hogs slaughtered the same year in Ft. Worth, Texas, having been raised on pasture and grain, only 2.4 per cent were tubercular according to Bulletin 781 of the U. S. Dept. Agr. Nine per cent of all hogs slaughtered in U. S. under government meat inspection during the fiscal year 1916 were tubercular.

Except from Tubercular Cows they could not have contracted the disease (with small numbers due to sputum from tubercular attendants, pigs suckling tubercular sows; and larger numbers due to eating uncooked tubercular garbage or carcasses of animals or poultry).

State Veterinarian Charles Keane advises us that between Oct. 1, 1916, and Feb. 28, 1917, 15,439 head of dairy stock had been tested under his supervision on 1,348 ranches. Of these 2,618 head, or 16.9 per cent of all cattle tested, were tubercular.

Healthy hogs fed tuberculous milk for three days and butchered 107 days later in U. S. Dept. Agr. experiments showed that 83.3 per cent had become tubercular. Healthy Hogs fed tuberculous milk 30 days and butchered 50 days later had all contracted the disease.

Condemnations of tubercular hogs in San Francisco in one week when most of the stock was from dairy districts reached 6 per cent.

Three Causes are apparent. Practically all of these hogs had either been fed milk from tubercular cows, had contracted the disease from their manure, or had been fed tubercular garbage or carcasses.

The Remedy is equally apparent. Cook all garbage and carcasses thoroughly. Exclude tubercular attendants. Do not let hogs touch manure from tubercular cows. Insist on pasteurization of all milk fed, or know that the milk is from healthy cows. If you feed creamery milk be sure it is all pasteurized thoroughly and not a drop of unpasteurized milk put into it later. A drop may contain 10,000 bacteria which would in a few hours infect any amount of milk. State laws and State supervision of pasteurization at creameries may be best.

Where milk is separated at home, Dr. Keane says, "We would go a step further and advise bringing milk up to boiling point to avoid need of a thermometer and have a safe margin."

Who Loses Condemned Hogs?—Not always the grower, though in the East many packers make the shippers pay for half of the condemnations, and this is also in force with the biggest packer of San Francisco. The time will come when this loss will be put directly onto the producer where it comes now directly in the form of lower prices.

COW'S EYES SWELLED.

To the Editor: My cow slobbers and has become very poor. At times she rubs her eyes and they swell up.—O. L. J., Fallon.

Place a few drops of a 5 per cent argyrol solution in the eyes twice a day.

Influence of Two Shorthorn Bulls.

[Written for Pacific Rural Press.]

As you see them in the corrals, they are just two old "shelley" bulls with rough coats of hair and an all-round appearance of many years of service. And yet they have retained that massive, thick, blocky, compact form so desirable in the beef animal.

To the student of Shorthorn history in California these 11- and 12-year-old bulls, Knight's Perfection and King Lancaster, must always be reckoned with, both for their own and their progeny's performance in service and show ring. To the younger breeder of all kinds of livestock, their history should straighten any misconstrued idea as to the value of the good sire in the establishment and maintenance of profitable herds and flocks.

Another important point brought out by a study of these two old bulls is the lack of show ring type in one and the pronounced show-ring standards of the other, although both have been great sires of show-ring winners. It emphasizes a fact, well known by successful breeders, that show-ring type is not always necessary in the sire in order that he produce properly formed offspring.

When the Hillcrest Stock Farm, owned by T. S. Glide, purchased Knight's Perfection in 1907 as a yearling it was with the intention of breeding him to the heifers of the previous herd sire, King Edward, a bull that had won first as a calf at the St. Louis Exposition and was grand champion bull at the Alaska-Yukon Exposition.

While purchased at a goodly sum, it was early recognized that Knight's Perfection was lacking the symmetry of form of a show bull; but his sire, Red Knight, had been a wonderful producer, and he had the frame, bone and constitution which Mr. Glide believed necessary to perpetuate.

On that account he was never shown but instead retained to breed on the King Edward heifers. The results of this cross quickly showed a preponderance of type and bone in the calves; and when exhibited at the livestock shows, they invariably won a little more than their share

of the prizes. Notable among these were the bulls Greenwood Knight, Greenwood Knight 2nd (both grand champions at the California State Fair), and the cow September Morn, whose show ring sensation is an old story among Shorthorn fanciers.

To the other bull, King Lancaster, fell the work of perpetuating his own qualities through the heifers of Knight's Perfection. His own conformation may best be explained by the statement that he was a three-time grand champion at the California State Fair, a feat no other Shorthorn has ever performed. And even yet he retains the straight, broad top line, compact middle and quality of head and neck that made him so popular years ago.

Like his father, King Edward, this great bull proved a wonderful transmitter of his own good characters. His get also were persistent prize winners at the shows, being bred to the best sons of Knight's Perfection; and in spite of his show yard career he was at all times a good sure breeder.

It would be unfair to both of these grand old herd sires, which are still doing service, to limit their praise to their own and their immediate progeny's performances; for it is the persistent transmission of good qualities in their granddaughters and grandsons and their great granddaughters and great grandsons that marks them so outstandingly good.

As you go through the present Glide herd of registered cattle, you find that the outstanding prospects are descendants of one or the other of these old bulls; and a comparison of them with recent purchases from other noted herds fails to convince you of the latter's superiority.

True enough, great sires are the exception rather than the rule; but Mr. Glide's experience should prove that the sire is not only half the herd but in many instances a great deal more. It is safe to assume that no cow or cows could ever do such a lasting good to any herd or flock of livestock as these two bulls have done for the Glide herd.

Wasted Eight Years of Breeding.

[Written for Pacific Rural Press.]

Not long ago a subscriber asked if he shouldn't save a young bull he had raised that was out of a good grade cow, sired by a purebred bull, reasoning that the bull was more apt to get high-producing heifers than a purebred bull of which he knew nothing.

It was on just such reasoning as this that H. E. Wickman of Butte county wasted about eight years in his breeding work; for while he has been dairying at his present location about 10 years it was only about two years ago that he began using a registered Holstein bull.

Both of the two bulls he had used previous to that time were sired by good registered bulls and out of heavy-producing grade cows. Heifers from both of these bulls were kept in the herd after freshening, with the idea that they were as good if not better than their dams.

Not having any certain method of determining their butterfat produc-

tion it was not difficult for Mr. Wickman to be fooled as to the relative worth of such heifers. But the third bull he purchased was of purebred ancestry on both sides; and soon after that he joined the local cow-testing association. Then he found that instead of the daughters from the grade bulls holding their own with the mature cows, they were producing less. That is why he thinks he has wasted so much of his time in the past 10 years and why he is an advocate of testing associations and purebred bulls.

A. R. Magruder of the Gotshall Cattle Loan Co., Ripon, reports the sale of the Holstein-Friesian sire, Juliana Stratford King Segis, to W. L. Denison of Modesto. This young bull was sired by a son of King Segis Pontiac Emperor and Juliana De Kol.

D. P. Robinson of Solano County is reported to have sold 60 ewes with their lambs for \$1080.

"We All Used To Leave The Fields—"

"One man and the EMPIRE do the work of three men," says Mr. A. W. Clayton, Madison, Wis. That permits the other two men to go right on with their work—or perhaps saves their salaries entirely.

will make your dairy more profitable and eliminate the drudgery from dairying. With an EMPIRE the milking is an incident—not an ordeal.

Better—purer milk and more of it are results of EMPIRE Milking.

EMPIRE Milking Machines are simple and efficient—gentle and natural in their action, and above all, they milk the SAME WAY EVERY DAY,—more uniform in action than even the calf. They safeguard the condition of valuable cows.

Let us tell you ALL the benefits they offer you. Write for Catalog 45—and also ask for information regarding EMPIRE Cream Separators, Gasoline Engines and Electric Plants.

Sale Barn in Hanford near S. P. Depot.

Seventeen Years' Silo Experience.

[Written for Pacific Rural Press.]

It is thought by many that the silo is a comparatively new thing in California; and for that reason we have heard many express a desire to wait till they have been thoroughly tried out before building one.

That this theory is not true may be seen in Sonoma county where for 17 years continuously John Denman has been a silo owner and user in spite of the fact that comparatively small corn yields are the rule rather than the exception.

Mr. Denman had four silos the greater part of that time, using them on both his Bloomfield and Penn Grove dairies, and though they were cheaply constructed of studding and resaw, one of them that was protected by a barn is still in good condition. The others had to be re-lined with building paper and resaw to overcome leakage.

Two distinct kinds of land have been used by Mr. Denman for corn growing, one a heavy black adobe and the other a light sandy soil. This and the further fact that one section was colder than the other called for different kinds of seed and different cultural methods.

On the dairy near Bloomfield the soil is sandy and early frosts often visit the section. On that account King Phillip seed has been used because of its early maturing qualities. The land there is plowed twice and harrowed six or seven times. A check row corn planter is used, planting the seed in hills three and a half feet in rows of an equal distance apart. Planting is usually done about the middle of May.

After the plants are above the ground the cultivators are started, the field usually being cultivated three times before harvest time in order to conserve the moisture, as irrigation is not practicable.

At times corn binders have been tried, but usually small-handled hoes

are used in harvesting the corn, as there is less waste of the stalk and the cost is practically the same with both methods. Mr. Denman says that with hauls of half a mile from field to silo the entire cost per ton of harvesting is \$1.25.

Value of Succulence.—The yield per acre of green silage is not large, the average being about five tons in fairly good years. But even this is profitable because it leaves the land in fine condition for grain or hay crops the following year, and furnishes the dairy cows a succulent feed at times of the year when there is no other green feed. In the past there have been years when the corn crop was light, and though the silage was replaced with hay and concentrates, the milk yield was materially reduced.

Unless a hot north wind comes up about ripening time, no water is used by Mr. Denman in the silo. He likes to have the ripest of his corn "pretty hard" before starting to cut; since the riper the corn, so long as there is moisture, the better the silage. If the field is hit with a dry wind just about ripening time he turns a small hose full of water into the cutter so that the silage will pack down well, otherwise no water is used.

On the adobe soil, cultural methods are somewhat different. There Yellow Dent seed is used, as it has a longer time to ripen. There the soil is plowed and top-worked a good deal in order to get the seed bed into good condition.

In feeding his silage to highly-bred Jerseys with an average weight of about 950 pounds having an average yearly production of 320 pounds fat, Mr. Denman uses 18 to 20 pounds silage, what wild oat hay they will eat, and seven or eight pounds of bran and oil cake meal, equal parts.

Alfalfa-Barley Silage Satisfactory.

[Written for Pacific Rural Press.]

"Barley and alfalfa mixed made the best silage I ever used," says J. D. Huston of Imperial, who has tried several kinds for his big Jersey herd in the past two years. This was siloed early in spring. It lasted until June in first-class condition; and the cows produced most while eating it.

The trouble with grain for silage often arises from the great proportion of air in the straws, due to waiting until it is too ripe. Air must be excluded from silage as perfectly as possible.

Mr. Huston's barley was in the milk when cut. The stems also were full of milk, which excluded air; and no water was added except to wet the top layer where it had been exposed overnight. The alfalfa was half in blossom. It and the barley were bound into sheaves like grain in the East. The sheaves were run through the silage cutter as soon as possible, the binder not being allowed over ½ day's start. The same thing will be done this spring.

A neighbor siloed barley in the dough; but the beards were tough

and the cows did not like it, though there was no noticeable spoilage.

SOFT BUTTER

To the Editor: A recently purchased cow gives milk rich in butterfat; but the butter made from her cream melts almost to oil in temperature that does not affect butter from other cows on the same feed.—Subscriber, Bethany.

[Answered by S. L. Denning, University Farm, Davis.]

It is difficult to locate the trouble with your subscriber's butter from the limited information furnished. He has a very weak-bodied butter. This is common at this time of the year when the cows are largely on pasture or green feed. The butterfat is very soft and gives this weak body, especially if the churning temperature is too high and the butter is worked too soft. I would suggest that he lower his churning temperature a few degrees and then use wash water that is a few degrees colder than the buttermilk so as to have the butter fairly firm during the salting and working.

IF YOU FEED STOCK YOU NEED A SILO

While you have been feeding high-priced hay, grain and mill feeds, during the past months, haven't you often wished you had a well-filled silo to help out? It would almost have paid for itself this season, wouldn't it?

BE SURE TO HAVE A SILO FOR THE COMING SEASON, AND BE SURE IT'S A

Remco Redwood Silo

Remco Silos are best for California Conditions. They are made of air-dried redwood which is next to everlasting and is not affected by the chemical action of the silage. They are made by a Company that has had 28 years of experience in building wood tanks, pipe and silos, and are designed and built to suit your requirements.

DAIRYING AND HOGS.

The Reynolds Land & Cattle Co. of San Ardo recently shipped a carload of hogs to San Francisco which netted them \$2483 f. o. b. San Ardo.

A. E. Slater of Pacheco, Contra Costa county, secured a Holstein bull from New York to replace the son of Prince Gelsche Walker which he sold last fall.

Official records still being made by H. E. Cornwell will be announced at the sale April 19 under management of the Cal. Breeders' Sales and Pedigree Co.

The Los Angeles county supervisors amended their garbage-hog ordinance so that breeders who do not feed garbage will pay 50 cents instead of \$3 per quarter per 100 head.

W. J. Higdon of Tulare sold his entire herd of 25 purebred Guernseys to A. J. Welch of Redwood City and will breed Holsteins only. He has 50 Holsteins and is in Washington to buy more.

Tulare County Registered Duroc Ass'n directors recently appointed are Allen Thompson, Tulare; J. L. Dickerson, Visalia; Le Grand Dailey, Tagus; R. E. Clifford, Strathmore, and W. J. Fulgham, Visalia.

Eight cows of the Gridley Cow Testing Ass'n produced over 50 pounds butterfat in March, according to figures furnished by Tester Geo. Clark. H. E. Wickman's grade Holstein stood highest with 67.9 pounds.

Dr. J. A. Crawshaw of Hanford reports sale of two gilts to W. E. Levee, Lowell Hill, Nevada county; one boar to E. R. Putz of Laton; and one boar to Dr. Frank Griffith of Hanford. His sows have had large healthy litters this spring.

The 400 purebred Holsteins of the Vina Ranch of Stanford University are to be dispersed at the ranch June 5, 6, and 7 under direction of M. H. Tichenor, sales manager. This herd was founded in the early 80's by Gov. Stanford, but it was only about two years ago that the last grade cow was sold.

McAlister & Sons of Chino write: "In the junior two-year-old division we have thrice exceeded the State records in the past two months with heifers freshened in our herd. K. P. Walker has the best record: 23.17 lbs. butter in 7 days, having freshened at 23 months."

Mark Requa, who has about 100 purebred Berkshires on the Anchorage Farms at Orland has recently bought for \$1500 the boar Star Leader bought for University Farm by Prof. J. I. Thompson for \$100 just before he was awarded junior championship at P. P. I. E.

Co-operative market-hog auction sales will be held at Tehachapi April 12, Bakersfield April 13, and Wasco April 14 similar to those recently

held at Wasco with great success. G. H. Peters was sent to Los Angeles to find out market conditions and to bid in the hogs if packers do not come up to market prices.

W. A. Young of Lodi recently received two young sows from Iowa. He has made the following sales: Boars to M. L. McDonald, Coopers-town; V. D. Goodrich, San Jose; Danner Bros., Santa Rosa; Stockton Seed Co.; Tony Tamagini, Youngstown; H. L. Martin, Oak Run; Paul Hopkins, Willows; and females to C. L. Bover, Youngstown; J. W. Kingry, Highland Spring; H. W. Robinson, Grass Valley; H. C. Carr, Porterville; M. C. Freeman, Marysville; J. G. Wise, Youngstown; C. S. Harker, Bakersfield; and O. H. Carr, Colusa.

Elmer Lamb of Ceres writes, "Ira Jackson, of Ohio, recently sold 45 Duroc Jersey sows bred to Orion Cherry King and Orion Cherry King Jr. for an average price of \$305.00 per head, the highest average ever received for any breed. The highest sow sold for \$570.00 and the lowest for \$165.00. Orion Cherry King was champion of all breeds Ohio State Fair 1913 and Premier Champion Omaha 1916. His son, Orion Cherry King Jr., was Grand Champion of Ohio and Grand Champion at the International Swine Show, Omaha, 1916, the biggest hog show ever held."

BEEF CATTLE AND SHEEP.

Sheep shearing in Humboldt county, Nevada, which ordinarily begins late in April, is delayed this year by bad weather.

Cattle and sheep men in the mountain sections of Alameda county report feed conditions much improved during the past three weeks.

C. W. Bowers of Davis has recently sold several registered red Durham bulls to Northern California points at \$300 to \$500 each.

Easton and Ward, horse breeders of Burlingame, propose to establish purebred cattle on their newly-acquired ranch in Contra Costa county.

J. C. Dobbel of Contra Costa county sold 500 of his ewes for \$12 per head. One of his neighbors sold the pick of his lambs to the butcher at \$10.

W. M. Carruthers feels that his sale of purebred Shorthorns at Mayfield May 2 will enrich the herds of many breeders in what he calls California, "The Shorthorn State."

Feed conditions in Santa Barbara county are said to be exceptionally good at this time, the season being much further along than in other sections of the State. Some hay is already in the shock.

E. H. Murphy of Perkins writes that he will soon ship a purebred Shorthorn foundation herd to Little Shasta Valley, Siskiyou county, and

Hillcrest Stock Farm.

Shorthorn Cattle, Shropshire and Merino Sheep

King Lancaster, sired by King Edward, grand champion bull State Fairs, 1909-10-11.

Shorthorn Bulls for Sale, sired by such noted bulls as King Lancaster, Knights Perfection, Greenwood Knight and Greenwood King. Nearly all offsprings of the famous King Edward.

These Bulls are conceded to be the best offering ever made from the Hillcrest Stock Farm.
